Prices held fairly steady up to Monday, when an easier tone developed, which resulted in shading prices as the day passed. Tuesday the tone was still easier, which brought out selling orders from holders. Chollar sold at $1.85 and Con. Virginia at $1.60. The Gold Hill shares sold down, also. At the day's closing Chollar strengthened to $1.90, but other shares were barely steady. Yesterday morning Best & Belcher firmed up slightly; but with the announcement that Challenge had been assessed 10 cents, there was a weaker feeling, particularly in the Gold Hill shares. The weakening in the latter was largely due to outside selling, caused by the assessment on Challenge, for, with its being levied, holders who had bought in expectation of an upmove in that group, lost faith, which caused many to sell. The putting of more miners to work in Crown Point and Belcher has not had the effect looked for by outsiders, while the work on the Brunswick lode has not turned out as good as had been expected, judging from the way in which the market for Chollar shares have acted—going down, instead of up. Trading throughout the week has been light, barely enough business passing to pay office expenses of two large firms, let alone of twenty or more. The number of persons going into the boards and those visiting tickers to see prices has dwindled to very small proportions. From the action of the market, it looks as if moneyed insiders are not paying any attention to it, but leaving it to the mercy of small pools and reckless chippers. While not taking an active interest in the game, it is not at all unlikely but they may be buying at declining prices, so as not to let prices go entirely out of sight. In doing this they can the better freeze out outside holders, if it is so desired by them. Among a large class of operators the opinion prevails that there will be no marked activity, outside of one or two spasmodic moves, in the market until after election. They claim that moneyed operators are devoting their time to local and national politics and therefore cannot give attention to mining shares, while outsiders are gradually drawing out of the market, a large majority of whom are operating in wheat futures and in New York railroad and industrial stocks, owing to lively fluctuations in prices.

The news from the Comstock mines is essentially unchanged since last week's advices. The work in several seems to be pushed with more vigor, particularly in the Gold Hill group. In the latter they have made prepations to extract more ore from two or more of them, while at the same time pushing dead and exploiting work. Con. Virginia commenced shipping ore to the mill yesterday, which started up on it to-day. Unless an increased number of tons of ore, and of higher grade, can be extracted, the company will run behind owing to the heavy expense incurred prosecuting work on the Comstock and Brunswick lodes. In Andes they struck a strong flow of water on the 420-foot level, which will have to run off before pushing work in that direction. In Utah the work is on the same level and in the same direction heretofore published. The material was, at last advices, looking better. In Sierra Nevada and Union the work is reported essentially unchanged. In Mexican work is still continued to the west on the 1000-foot level. The formation is about the same as reported last week. The work in Ophir is on the Central Tunnel and 1000-foot levels. In prosecuting the work it is said that all favorable prospects are being followed up. In Con. Virginia they are upraising in favorable formation from the 1000-foot level. On the 1650-foot level the east crossdrift near Best & Belcher is being pushed ahead, while from the work on the 1750-foot level ore is raised. Last week 169 tons, assaying about $50 a ton, were raised to the surface. Work is continued in the Gould & Curry and Best & Belcher east crossdrift from the Bonner shaft. The material encountered does not show any particular change since our last advices. In Savage active work is under way on several levels, with nothing new to report. Advices from the work in Hale & Norcross are not quite so favorable. From Chollar, Potosi and Bullion our advices are about the same as given last week. In Alpha work is still continued in the workings on the 500-foot level. The west crossdrifts in Con. Imperial are pushed slowly ahead, with no essential change reported in the formation. Work is to be resumed before long in Challenge. In prosecuting the work in Confidence a few tons of fair-grade ore, assaying $23 a ton, are raised each week. Information from Yellow Jacket is hard to get. Work in Kentuck has not been resumed, and probably will not be until the treasury shares have been sold in the market or otherwise. In Crown Point active work is under way on two or three levels. They are milling the gold ore which is raised each week. The assays are said to be around $9 to $12 a ton, but no official advices of it have as yet been made public. The output of ore by Belcher shows a slight increase. The grade is about the same as that heretofore taken out. Seg. Belcher and Overman continue to raise some ore each week. In the Alta group there is nothing new to report. The levying of an assessment by Justice would seem to indicate more activity in that mine before long.

The attention of dealers is still centered on work on the Brunswick lode. In Occidental it is being pushed on several levels. An improvement is reported, which imparted more life yesterday to the shares and caused them to sell higher. That in Chollar, on the 300-foot level, is said to be disappointing, but as they have to run some 30 or 40 feet in the crossdrift before they expect to cut the downward continuation of the ore found above, they may yet find something of importance. It is calculated that the Norcross-Chollar south drift on the 400-foot level will be to the Chollar north line by Sunday; when this objective point has been reached the management will take up the work, but whether it will be run for the ore found above or run it as now, along the footwall, is an open question. It is stated that the coming week a crossdrift will be started by Hale & Norcross on the 400-foot level near the Chollar line for the purpose of running for the ore on the 300-foot level. The other work in that mine, and also that in Savage, Gould & Curry, Best & Belcher and Con. Virginia, is continued in the directions heretofore published in this department.

The market opened this morning dull and heavy. After the regular call the tendency was to lower prices with outsiders letting go. The closing at noon was weak and inactive. At the 2:30 P. M. session there was a genuine boom, with Hale & Norcross and Chollar the leaders. The advance in them was 50 per cent on the morning sales. The cause for the upmove no one on the outside seems to know. The general opinion is that quite a line of shorts has accumulated and the quick move was made so as make them fill at an advance. So far as the writer is able to learn there is quite an improvement in Chollar on the Comstock lode. But there are reports that the Chollar crossdrift on the 300-foot level Brunswick lode is in ore, and there is still another that in the Hale & Norcross winze on that lode they have struck ore, while some say that there has been quite an improvement in the upraise in Con. Virginia on the Comstock lode. Let it be what it may, the short sellers can have the pleasure of filling at a loss.

The following illustrates the changes of the week:

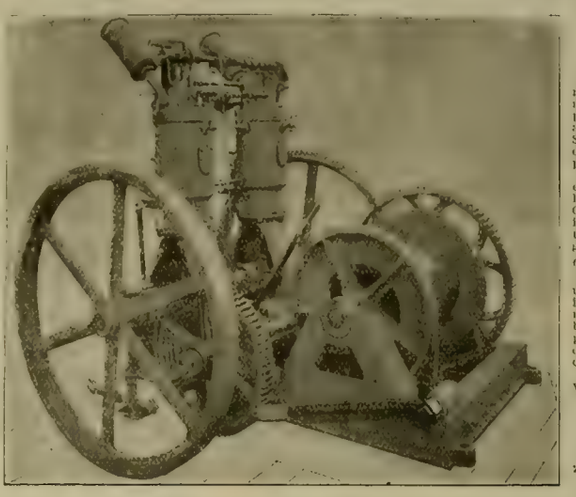
M., for the purpose of electing a Board of Directors for the ensuing year, and the transaction of such other business as may come before the meeting. Transfer books will close on Saturday, October 17th, at 12 o'clock M.

E. D. FARISH, Secretary.

Office—Room 5, No. 632 Market street, San Francisco, California.

Golden Gate Gas... Engine.



With Mine Hoist Connected.

These HOISTS are now in use on several mines and they have proved practical, safe and economical. Starts and stops with ease. Speed under perfect control.

The entire plant, engine and hoist, is light and compact. Can readily be placed in any position, on the surface or underground.

Capacity from 4 to 50 h.p.

The "Golden Gate" uses Gas or Gasoline; it is the simplest and most reliable engine built. It furnishes power wherever required at the lowest cost.

Send for circulars with full particulars.

THE HALLIDIE ROPEWAY

Stands pre-eminent for the transportation of Ore, Fuel and other materials over mountainous and rugged country.

Parties desiring to remove large quantities of Sand, Gravel, Earth, Ore, Rock, to construct Dams, Levees or Embankments, etc., can do more efficient work at less cost by the

Hallidie System of Ropeway Transportation

Than by any other known system.

The Forestry Commission.

The work of the United States Forestry Commission in the field has been completed. They have finished their summer tour in which they viewed the national parks, reservations and all the leading forest districts of this western country. Their report, which will be issued within a few months, can-not fail to be of great importance to the public. The need is recognized of forest preservation and of a permanent policy in regard to forests on the part of the Federal Government.

Members of the Commission state that everything they saw made more and more apparent the need of forest supervision on account of the great fires they witnessed and of the immense amount of absolute and at times almost wanton destruction by the hand of men. The forests have not been used wisely at all, but simply destroyed.

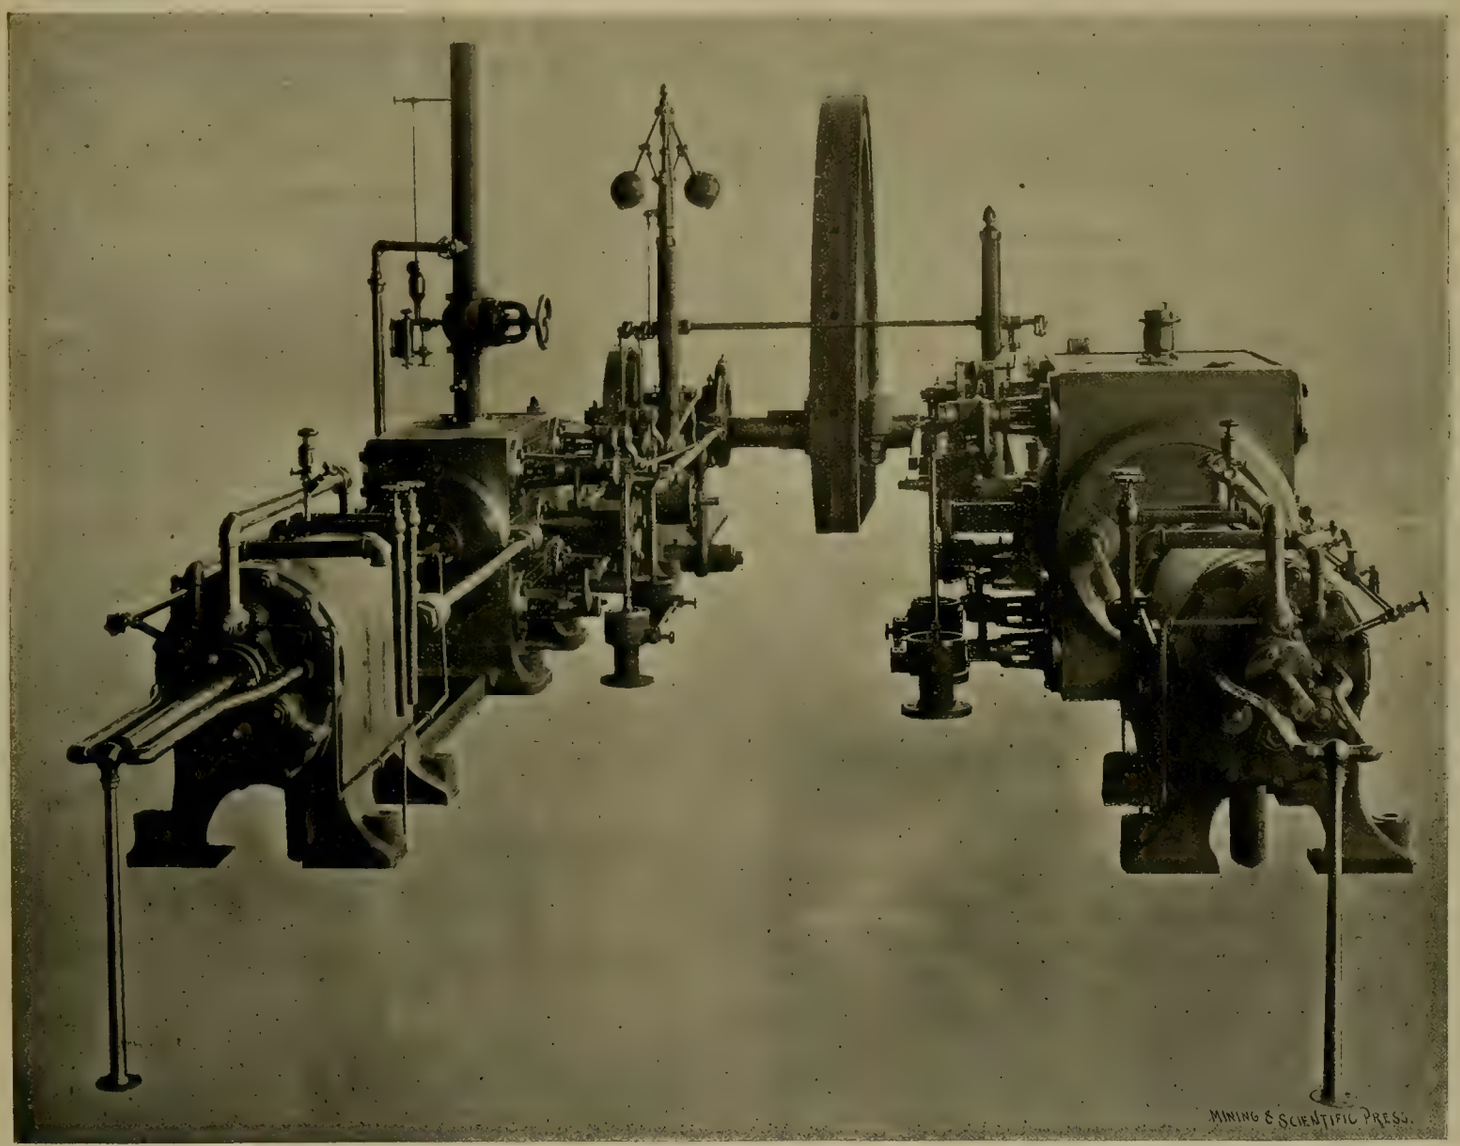
The object of the Commission, of course, is to discover by what methods the forests can best be made use of without total destruction. The forests still left are capable of producing perennial harvests for every proper use without such destruction. A very important object in the preservation of the forests is the protection of the sources of the streams.

The appointment of this Commission, at the request of the Secretary of the Interior, was the first step taken by the Government toward getting the forestry administration put on a definite working basis. No true friend of the forests nor any one of the Commissioners had the slightest thought of withdrawing any of the forests from use. It is not their desire to prevent timber from being cut, but to see that it is cut in such a way as to still preserve the forests for future generations and at the same time guard the watersheds. This is a matter of great importance for the mining industry in this State. Its welfare will depend much upon cheap and abundant timber and water power.

An Air Compressor for Montana.

The good work done in mining machinery by the San Francisco foundries is shown by the large orders filled for distant points in competition with the East.

We illustrate on this page an air compressor recently built for the Boston & Montana Company's Leonard shaft in Butte, Montana. It is a 20-drill machine with cross compound Corliss steam cylinder and the Risdon patent ring inlet air cylinders, with their new patent unloading device. This machine is a model of its kind, and is one of the highest class air compressors ever built. The air cylinders have a single inlet valve in each head of what is known as the ring inlet type. The water circulation is of the double system—that is, taking two streams of water and distributing same through walls and heads of cylinders. It will be seen from the illustration herewith how complete the machine is. The Risdon Iron Works of this city are the builders.



AIR COMPRESSOR BUILT IN THIS CITY FOR THE BOSTON & MONTANA COMPANY, BUTTE, MONTANA.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Air Compressor Built in This City for the Boston & Montana Company, Butte, Montana, 333. Manitou Tunnel Power Plant, 339.

EDITORIAL.—The Forestry Commission; An Air Compressor for Montana, 333. A Species of Blackmail; Relocators' Rights; The Geological Survey and New Mining Districts; The World's Gold Yield; Location Notices in California; The Miner and the Court, 334.

SCIENTIFIC PROGRESS.—Transcontinental Arc; Accuracy of Chemical Analysis; Impossibilities Made Possible, 338. Highest Meteorological Observatory in Europe; Solvent for Gold and Silver; Ordinary Gauge Glasses, 339.

ELECTRICAL PROGRESS.—Manitou Tunnel Power Plant; The French Motor-Car Demonstration, 339.

MECHANICAL PROGRESS.—Hoisting Six Barrels a Minute; The Utilization of Waste Slag; Nickel-Steel; Large Locomotive Industry in Russia, 339.

PRACTICAL INFORMATION.—A French Decision on Subsidence; Number of Postoffices in the United States; Benefits of Railroads; Exports of British Tinplate; Increased Area and Growth of Woodlands Throughout New England; Discovery of the Celebrated Leary Raft, Applications for the Granting of Mining Concessions by the Greek Government, 340.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 342-3.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 350.

MISCELLANEOUS.—Concentrates, 335. The Development of Colorado's Mining Industry, 336. Mine and Mill Reports; Gold Mining Coming to the Front; A Miners' Association Headquarters 337. Note on a Shaft Fire and Its Lesson, 338. Coast Industria Notes; Personal; Recently Declared Mining Divdends; Recent California Mining Incorporations, 341. Commercial Paragraphs; Recent Patents; Notices of Recent Patents, 344.

In a number of the older mining districts of this State there are men who make it a business to levy a species of blackmail that should be suppressed. It is their custom whenever a bona fide location is made, particularly by any one with means, to locate other claims all around for the purpose of cutting off opportunities for obtaining tunnel rights or other privileges necessary to working his property. This has become such a nuisance that in many districts it is necessary for a person to make many locations to protect one. The harpies do not do any assessment work, but, at the end of a year, if they still believe they may be able to levy tribute, have their claims relocated by partners in crime and so hold for another year.

Relocators' Rights.

On a very large proportion of the mining locations that have been made in this State the locators have done no assessment work; but with the revived interest in mining in many cases these men who have allowed their interests to lapse, come in and attempt to claim title over others who have come in later and located over their ground. The new locators are often in doubt as to the rights in the premises and we often receive communications asking whether the first locators have any rights, and if not, how they may be dispossessed of the property. In cases where they have taken to doing development or assessment work long after all other rights have passed away, they are simply trespassers.

One correspondent, who has located upon ground which had been previously located, but upon which no assessment work had been done for three years, asks what he should do in the premises. In earlier days a shotgun would probably have suggested itself to our correspondent, but that old custom has passed away and the lawyer has taken the place of the shotgun. We can only advise him to consult his attorney. The other man is a trespasser simply, without any rights in the premises.

The Geological Survey and New Mining Districts.

There has been of late a commendable activity on the part of the United States Geological Survey in the way of making timely examinations of new mining districts. A party of surveyors has lately returned from the Yukon country in Alaska. Others have been in the new districts in Utah and southern Nevada to look over the ground and determine what further work should be done. A member of the survey is on the same mission in the Black Hills. The reports upon the Mercur and Cripple Creek districts were of great value. These later reports should be published with less delay than has been the custom in the past. The report upon the Yukon placers will be looked for eagerly by many who have been attracted by news from that region, and it is to be hoped that it will appear in time for the opening up of next season. So far, information about the mines of that part of the country has been very contradictory. It will be greatly to the advantage of Alaska to have truthful reports made of the properties, whether they are favorable or not.

The World's Gold Yield.

The gold yield of 1895 was by far the largest in the history of the world—something over $200,000,000. Enough reports have been received from the different gold fields of the world to show that this will be considerably increased for 1896. With little exception, there will be an increase in all the large gold producing districts of the world, and many new districts which were hardly noticed before will come forward with large figures.

In California, throughout the entire gold region, there has been more activity and development than ever before. While this will not cause a large increase in the output of 1896 over that of 1895, for the reason that many of the mines being developed will not begin to produce bullion for one or two years, yet the newly opened mines and the large increase of activity will materially add to the bullion yield of last year. Much the same may be said of Colorado. The output of Cripple Creek promises to be about $2,000,000 more than that of last year. New gold mines have been opened in other parts of that State, and the total yield should be considerably increased.

Nevada has not been counted among the gold-producing States heretofore, but the opening up of the immensely rich mines about Pioche, State Line and smaller mines in other parts of the State promises to make the gold yield of that State of considerable importance. In Montana, Idaho, Wyoming and Colorado there has been a great deal of activity in gravel mining. Not enough has been done to make much addition to the gold yield of this year, but there can be little doubt that the gravel deposits in these States will in time yield large sums.

In Alaska there has been an increase of the gold yield, and there will be a greater increase next year. British Columbia will do more for the increase of this year's output than any other single new district. Further east, in the British possessions, new gold mines are being opened up. In South America there is some new interest in gravel mines. Several California engineers have been called there to take charge of or expert mines for British syndicates. In Australia activity in mining has been greater than ever before, and the output of gold should be larger than that of last year. In South Africa the output for the last two months is the largest on record. The output of the mines of Russia last year were estimated at $34,000,000, and there is more being done this year than there was last. Gold mines are being opened up in countries hitherto unknown as producers of the noble metal.

There can be little question that in nearly all these districts named the output of gold will increase for several years. The query then becomes, not as to whether there will be an abundant supply of gold for the next few years to come, but how long will it hold out.

The reduction of the cost of working and milling ores has been the cause of opening up many mines that would otherwise have remained untouched. Many reports are received of cases where the cost of both milling and mining is less than $2 a ton. The main problems for mining engineers will be in this direction. A small reduction in the cost means the opening up of many mines already known to exist that would otherwise remain valueless. In South Africa, for example, of the numerous parallel reefs, as they are called, at first only one—the richest—was worked; now two, and sometimes three or more are opened. A large majority of these reefs are of such low ground that with present methods they cannot be worked, and the question as to how much the future output will be depends entirely upon the reduction in the cost of the working.

Location Notices in California.

The want of State laws to supplement federal statutes and rulings of the general land office has caused much confusion as to what is necessary in making locations of mining claims. We are continually in receipt of queries on this subject and many of them will be answered by the following valuable hints about the location notice which Mr. A. H. Ricketts of this city has written for us.

A location notice can be written or printed upon paper, cloth or parchment.

It can be cut or engraved upon wood, stone or any metallic substance, or be painted upon a board.

Aniline inks quickly fade upon exposure to the elements. Hence, a posted notice should not be written with red ink or upon the typewriter.

An exposed notice of location which is written with a lead pencil will remain legible longer than one written with ink.

There is no legal reason why a location notice should not be written with a lead pencil.

It will be presumed that every locator is a citizen of the United States. Hence, it is unnecessary to state the fact of citizenship in the location notice.

It is unnecessary to make any allusion in the notice of location to the age or sex of the locator.

A minor, a female or a corporation can make a valid location of mining ground.

The words "dated on the ground" are mere surplusage in the location notice.

It is not necessary to state in the location notice the size, character nor position of the boundary monuments.

It is only the recorded notice of location which should contain a reference to a natural object or permanent monument.

Unless required by local rule or the custom of miners a valid location can be made without either posting or recording a notice of location.

Unless regulated by local rule or custom a location notice can be recorded before it is posted. Generally, the order in which those acts are performed is immaterial.

Recording a notice of location is not required by the Federal Statute and when not required by local laws is unnecessary and useless if made.

The Miner and the Court.

Strictly speaking, the term "tunnel" is only applicable to a nearly horizontal passage through a hill, open at both ends, as a railroad tunnel. But in this country the word tunnel is used in place of the word "adit," and is generally understood to mean a nearly horizontal passage from the surface, by means of which a mining claim may be entered, worked or unwatered. In the case of Jurgenson vs. Diller, the Supreme Court of this State has astonished the mining world by stating that "Drifting in a tunnel means taking earth, gravel or ore from ground made accessible by means of the tunnel, and is not synonymous with *running* a tunnel," and therefore not the kind of construction requiring a notice to be posted by the owner disclaiming responsibility under the Mechanics' Lien law.

The distinction is not apparent. How a tunnel can be "run" without taking earth, gravel or ore from ground made accessible by means of the tunnel the Supreme Court forgot to tell us. It would naturally seem that "drifting in a tunnel" or "running a tunnel" was a mere choice of words; but under the decision cited it would seem that a right of lien exists in the miner working upon a crosscut tunnel until it reaches the ledge, and at no time upon a tunnel which follows the vein. Carried to its logical conclusion, it seems to follow that a miner's right of lien under this definition will depend on whether he is working on pay ore or is engaged in prospecting or dead work. If he is seeking ore today, he may have his lien; but if he is stoping ore to-morrow, no right of lien attaches. The Supreme Court seems to have reduced the lien law to an absurdity, so far as the mine is concerned, by this opinion and the one which declared that no lien existed where the property worked was upon ground held under an agricultural patent or Mexican grant, as such land is not a "mining claim," although the work in one instance at least was shown to have been done on a "bed of auriferous gravel."

Concentrates.

THE Champion mine at Nevada City is employing 200 men.

AN expedition fitted out to search for gold in Terra del Fuego has left New York.

THE Canadian Pacific Railway is taking out about 1200 tons of ore monthly from the Slocan.

HOISTING WORKS are soon to be erected at the Pocohontas mine at Drytown, Amador county.

THE yield of gold from New Zealand for the three months ending September 30th was 237,079 ounces.

LEADVILLE shipped more ore in '95 than any other camp in Colorado—453,633 tons—mostly low grade, lead-silver and silver-iron ore.

THE Union Hill Mining Company has decided to erect a mill of large capacity on the group of mines in the Black Hills, South Dakota.

THE owners of the Louisiana mine, A. C. Cable superintendent, at Coulterville, Mariposa county, are about to erect a 10-stamp mill.

THE October tonnage handled by the Mercur, Utah, railway is reported larger than at any period since the rush to that camp last spring.

UPON striking rich ore in the Golden Queen mine in Butte county, which was purchased lately, H. P. Stow raised the wages of his men.

FIRE, last Friday, destroyed the hoisting works of the Gray Eagle mine, near Colfax, Cal. The mine is now worked through a tunnel.

THE striking Leadville, Col., miners have started a paper—the *Miner*. Many a paper has supported a cause, but no cause ever yet supported a paper.

SOME Salt Lake capitalists have been investing in claims in the Meadow Lake district in Nevada county, and claim that there are prospects of large mines there.

IT is stated that President Cleveland is a shareholder in the Golden Scepter Mining Co., at Quigley, Montana, which owns a plant that has cost about $750,000.

IT is reported that the old Sheep Ranch mine in Calaveras county will be started up again. It was many years ago one of the big bullion producers of the mother lode.

A DIAMOND DRILL run in 140 feet in the Alma mine, in Amador county, showed such good prospects last week that orders were issued to resume sinking, which will be continued to a depth of 1000 feet.

A LATE visit of Northern Pacific officials to Trail, British Columbia, is said to have been for the purpose of looking over the field with a view to building in a branch which would give two roads to the district.

THE Postmaster-General has issued a fraud order against James C. Lovett, treasurer of the Tortillita Gold Mining Company, having headquarters at 531 Broadway, New York City. The concern advertised mines in this State.

THERE are shipped 600 tons of concentrates monthly from the mines in the vicinity of Baker City, Or. This does not represent the entire value of all the ore in the district, as a large amount is saved on the plates in the stamp mills.

SAMUEL FRANKLIN EMMONS, of the United States Geological Survey, has been sent to the Black Hills to make a preliminary investigation for the purpose of determining whether or not a complete survey and report are practical and advisable.

SPECIE imports to San Francisco from January 1st to October 1st, '96, aggregate $4,283,209. Of this amount there was gold bullion, $665,912; gold coin, $2,136,150; silver bullion, $1,211,366; silver coin, $269,775. The totals for the first nine months of '95 aggregated $2,691,030.

THE annual assessment work required for two or more adjoining claims or group of claims can be done on one claim, the total amount of such work equaling $100 for each claim, when it can be shown that the work so done was for the development of all the claims in question.

DR. GEORGE F. BECKER, of the United States Geological Survey, has returned to Washington from his work of examination into the geology of the Transvaal. According to a dispatch from Washington he states that there is more gold in the Transvaal ready to be mined than the amount now in use throughout the world.

SUPERINTENDENT W. L. HONNALD of the California Exploration Company advertises in the Calaveras papers that a contract for driving and timbering 250 feet of tunnel on the Vair or Gobie ranch, near Mokelumne Hill, with the privilege of an additional 250 feet, will be let at the company's office, Mokelumne Hill, October 30, 1896.

PROBABLY the most striking illustration of the tremendous and universal interest now manifested in the great political struggle that culminates in the next ten days is furnished by the fact that one day's registration of votes in the city of Chicago aggregated almost 250,000 names. The total vote of this country on Nov. 3rd will be unusually large.

THERE will be an extra ten thousand issued of next week's paper. That is, in addition to the usual edition 10,000 more copies of the issue of October 31st will be printed and distributed. The issues of November 7th and November 14th will be devoted chiefly to the annual convention of the California Miners' Association. Of these, also, there will be a large extra edition.

THERE was transferred recently to the Boston and Alaska Gold Mining Company the title to forty-one mining claims on Admiralty island, Alaska. The property transferred includes a 10-stamp mill in operation. The Boston company has 50,000 shares of stock, some of which have been sold at $3 per share, and an issue of $400,000 6 per cent ten-year bonds, of which about $200,000 have already been placed.

D. K. ALLEN has sold for $60,000, to George W. Ireland, the Golden Dream group of five mines, the Alcyon group of five mines, the Oro Blanco group of five mines, the Noon Day group of five mines and four millsites, situated in White Gold basin, in the old Picacho district, on the Colorado river, in San Diego county. The veins are noted for their great size. They are of low grade, but have the advantage of being near the Colorado river.

THE Toronto *Star* urges that the Dominion Government should appoint a commission to proceed at once to British Columbia to investigate and report upon mining. "This should be done at once, or we shall have such a mining boom as will damn our mining interests for half a century to come. This is no idle talk, but a solemn warning, based upon observation and knowledge. The commission might consist of a mining expert, to examine mines and prospects, a judge or Queen's counsel, to examine the bona fides of the schemes projected, and a representative of the Government, to inquire into the sentiments of genuine miners, and to get himself in touch with the West with a view to subsequent legislation."

THE gold imports for September, '96, aggregated $31,359,130, as against $749,459 for September, '95; for nine months, $64,888,856, against $28,839,939 during the same period of '95. The exports of silver during September last amounted to $5,534,110, which is practically the same amount as was exported during September, '95. The exports for nine months were $94,641,041, and for the corresponding months last year $38,664,610. The imports of silver during September amounted to $741,406, and for September, '95, $1,751,193.

THE world's gold yield for '95 is estimated as follows: United States, $46,800,000; South Africa, $43,000,000; Australia, $42,800,000; Russia, $34,000,000; other countries, $36,400,000. Total, $203,000,000. It is thought that for '96 this country will produce $50,000,000, and that the other countries will show a proportional increase. The world's production of silver in '95 was $226,000,000 (coining value), divided as follows: United States, $72,000,000; Mexico, $64,500,000; Bolivia, $27,000,000; Australia, $26,000,000; other countries, $36,500,000.

SPECULATING on where the output of Cripple Greek of $1,000,000 for September went, the Denver *Republican* says: "There are now working in the camp fully 5000 men, who are exclusively connected with the mining industry, either as miners, engineers, surface men, ore haulers or mill men. These draw in the aggregate fully $350,000 a month. The railroads and mills get for hauling and treating the ore $160,000 more, the timber, fuel and ammunition expense will reach $120,000, and this leaves for the profit of the mine owners $370,000."

A CHICAGO syndicate has purchased for $200,000 the claims and property owned by the Alaska-Willoughby Gold Mining Company and the Mountain King group in Alaska. It is stated that the size of the mill will at once be increased to thirty stamps, as was originally intended, and that a narrow-gauge railroad will be built from the beach to the King group. This group consists of eleven claims—the Mountain King, Mountain Queen, Devil Club, Alice Miller, Pungle Up, Pungle Down, Columbia, Washington, Cleveland, Pyrate and Patterson.

AT the rock drilling contest at the Spokane fair Freethey and Davey of Butte, Montana, held their title to the championship by raising their own record from 42 inches to 49⅜ inches. It was an exciting affair, for good work was done by all the contestants. O'Donald and Spaulding of Cœur d'Alene began by driving the drill down 40⅝ inches. Freethey and Davey followed, making a record of 49⅜ inches. After the Butte team had finished Ross and Smith, the Rossland team, drove the drill into the rock 44 inches, breaking the previous world's record 2 inches.

THE manager of the De La Mar properties in southern Nevada, H. A. Cohen, speaking of them, says that the group known as the De La Mar Company has an output of between $195,000 and $200,000 per month. The capacity is 200 tons a day and the monthly average during this year has been 6500 tons. Notwithstanding the fact that the camp is 170 miles from the railroad, men are going in by the hundreds. All imagine they are going to get work, and a probable explanation of the fame of the camp is that the mines are dry, pleasant to work in, and the men, without exception, receive $3 per day.

THERE have been recently a number of representatives of big European syndicates and capitalists in Utah and southern Nevada seeking to purchase some of the big producing mines. Among those which have been or are now being considered are the Mercur, Sacramento, Centennial Eureka, Silver King, DeLamar and April Fool. So far, it is understood, the figures offered are not acceptable to the owners. The Mercur, which has paid half a million in dividends, was some time ago offered in London, but lately the offer was withdrawn, although the English people were ready to pay the price asked.

AT last Tuesday's meeting of the State Anti-Debris Association Manager Phipps stated that many complaints had been made of the injurious effects produced by mining in the river beds near Oroville, by which the material in the river was excavated, removed by elevators and placed again in the river, and reported on the cases pending in the Federal and State courts. It is expected that Judge McKenna of the United States Circuit Court will soon render his decision in the North Bloomfield case, involving the construction of the act of Congress prohibiting hydraulic mining where permits have not been obtained.

A CORRESPONDENT of the Seattle *Spokesman-Review*, writing from Trail, B. C., says: "To a visitor who walks the streets for the first time, the sight of so many well-built stores and homes, the numerous improvements, the huge smelter pouring out smoke and steam from a dozen stacks, the two bridges built by the town, costing $6000, and the clatter of carpenters' hammers, the whiz and whir of the steam hoist, as it draws the loads from the decks of the river steamers, the machine shops that are now in full operation, saw mills, a brewery turning out fifty barrels of beer daily, bottling works, street grading and the Columbia & Western Railway, as it rushes through the town dragging heavily loaded cars from the steamboat landing to the interior, returning with ore cars to the mines—all impress one that the town has been in existence many years, when the fact of the matter is that it has not seen its first birthday, and will not for a month to come."

A MINER lately returned from Circle City gives some information about that place that will interest miners used to the customs of earlier days in this State. He says in the Seattle *Spokesman-Review*: "I passed women on the trail on the way to Circle City. The city is a log cabin town of about 1300 people, when the miners are all at home. There are about fifty women in the place. It is governed by miners' law, and there is no appeal from its decisions. No one is allowed to carry a revolver. Any infraction means a trip down the Yukon with only blankets. All respect the law set down by the miners. There is no theft. I never locked my cabin door. One man did steal some dust and the culprit had to leave. George W. Ross is deputy collector, and H. H. Wendling, both Eastsiders, is with him. The miners don't like the impression to go abroad that they are not law-abiding, although they are a law unto themselves. Circle City is an orderly mining camp. Of course, there are twenty-six saloons in the place, and dancing halls, but, on the whole, it is an orderly mining town. The recent killing of a man took place before I left, and I was a witness to it. The man who did the shooting was tried and acquitted by the miners' court."

IN a lecture delivered by Professor Robert Lewers on the history of Nevada, he states that the first permanent settlement within the present limits of Nevada was made at Mormon station by John Reese, a Salt Lake trader, on July 4, 1851. Gold canyon was well known to the overland travelers, and it is probable that gold was discovered in what is now known as Dayton in 1849. It is certain that Cole and Robison discovered it there in 1850. Sol Weill, a contractor on the Reese or Rose ditch, now known as the Douglas ditch, brought about thirty Chinamen from California to work on the ditch, and renamed the settlement Chinatown. Chinatown changed and Mineral Rapids appeared, then Clinton, then Nevada City, and finally in 1861 the citizens in public meeting selected the name of Dayton. Virginia City was settled in 1859, and Lyman Jones, now of Silver City, built the first house.

IN calling for a meeting to reorganize the El Dorado County Miners' Association, J. F. Lang writes to the Placerville *Nugget*: "The revival of the mining industries of El Dorado county is steadily improving and the outlook is quite encouraging. After long and persevering work in seeking to represent the situation carefully and honestly, we are attracting attention of capitalists toward this section of country. Along with the growth of this search for mining properties, we are establishing the fact in the minds of mine seekers that El Dorado, though it has been dormant for many years, is a good and safe country for the prospector, that the mines are here and can be found, but that we require the aid of capital for their development. In keeping with this spirit of progress, we should be in accord with the State Miners' Association, whose benefits and advantages to California were well outlined in the article presented in the *Nugget* yesterday from the MINING AND SCIENTIFIC PRESS."

THE present methods of mining iron ores vary according to the character of the deposit, from stripping and mining with the steam shovels to working with rock drills many hundreds of feet below the surface of the earth. Some mines are wrought open cut, but the majority are operated under ground; all the different methods of long-wall mining, caving, milling, overhand and underhand stoping, as well as the various systems of timbering and filling, are said to be in active use in the iron ore mines of Lake Superior. The character of the ore also varies from soft material, easily handled by the shovels, to rock so hard as to severely test the tools and apparatus employed. As showing the difference in this respect characterizing different localities, it is stated that rock drills of the same size and working under similar pressure, which bored 100 to 120 feet in ten hours in the limestone of the Chicago drainage canal, could not cut more than 5 to 6 feet in hard Minnesota and 18 to 20 feet in hard Marquette ores.

PRODUCTION from the Cripple Creek, Col., district was heavier in September than in any other month in the life of the camp, exceeding by fully 1200 tons the output of October, 1895, which held the tonnage record up to then, says the Denver *Republican*. Cripple Creek is not a heavy tonnage camp, but what it fails in quantity it makes up in quality of the ore. A close estimate of the September output makes it 16,500 tons. The nearest estimate of the aggregate value of this ore obtainable places it between $900,000 and $1,100,000. October will undoubtedly show a substantial gain over these figures. For the year estimates are difficult to obtain. During the first six months the output suffered from the loss of the Portland and Independence, and there were few new mines to offset them. The general opinion is that it ran between $4,000,000 and $5,000,000 in that period. Since then the output has been heavily increased by many small new mines and by the heavy production from the Gold Coin, Anaconda, Ironclad and Gold Crater companies, as well as the increase from the Victor, Elkton, Anchori-Leland and Moon-Anchor. Close observers say that the total production for the year will reach $10,000,000, an increase of $2,000,000 over last year.

THE annual report of Commissioner Lamoreaux for the fiscal year shows land selections for the year aggregating 13,209,000 acres, of which 6,789,591 acres were railroad selections. The acreage increase over the previous year was 4,802,673 and the cash increase $72,709, the total cash receipts amounting to $2,106,361. The railroads received patents to lands on grants covering 15,527,844 acres, being an excess of 7,343,508 over last year. Agricultural patents increased 2,684,380 acres, the total being 5,570,400 acres. The total number of acres for which patents were issued was 22,669,989. The surveyed vacant public land is 316,651,861 acres, the unsurveyed 283,388,810 acres, a total of 600,040,671 acres yet unoccupied. Of the surveyed acreage 8,908,808 acres were added during the year. Recommendations are offered by Commissioner Lamoreaux for the good of the department as follows: For the continuous appropriations for surveys and resurveys of public lands; for the creation of the office of surveyor general of Alaska; for the establishment of a national irrigation commission; providing for the compulsory attendance of witnesses in contests before district land offices; for the protection of timber on the public domain and on public forest reservations, and timber from destruction by fire.

W. F. KENDRICK of Denver writes: "Letters received indicate that the opinion prevails among many people that the depression in mining stocks, which was in sympathy with other lines of stocks during the hot weather, was on account of lack of production of the mines of the State; but this is a serious mistake. As an illustration: Although many mines of Leadville were closed by the labor troubles, which affected that camp only, it is producing now probably over 1000 tons of ore daily, and from the additional mines resuming work we anticipate 1500 tons daily by the first of November. At Cripple Creek the output for September is given to exceed 17,000 tons of an estimated value of $960,000, and for the balance of the year the output will considerably exceed $1,000,000 monthly, as there has been a greater amount of ore blocked out ready for shipment, and more new strikes within the past sixty days, than in any other period in the camp's history. Gilpin, Clear Creek, Boulder, Alma, San Juan, Gunnison and Aspen districts are exceeding their last year's output, and in each and all of these camps an unusual amount of preparatory work is going on for active winter mining. The improved methods and system by which mining is now conducted over former years increases not only the product of the mines, but the net profits in a greater ratio. The new mills and reduction works erected at or near the mines this season, so far as we are acquainted, have a capacity for handling about 600 tons of ore daily additional to that of the past."

The Development of Colorado's Mining Industry.

By T. A. RICKARD, State Geologist of Colorado.

The history of Colorado is that of one generation. Thirty-six years only have elapsed since the birth of that beneficent industry, whose footsteps were the first to traverse the wilderness of the prairies and penetrate the solitude of the mountains. So soon is history made.

In the summer of 1849 a party of seven Georgians were taking a herd of thoroughbred horses across the continent to California. They reached Camp Lyon on the Arkansas in October, and, meeting James Dempsey, a Government guide, they were persuaded by him that it was too late to cross the mountains that season. His advice was followed, and, moving northward, they established a winter camp at the junction of Cherry creek and the Platte. Upon a sand-bar lining the south side of the river, they built two cabins. During the closing months of that year they prospected the alluvial banks of Cherry creek, but did not penetrate into the mountain canyons for fear of the Indians. Gold was found in several places, and particularly at a point sixteen miles up the stream. From the feathers of the wild geese which they shot they made quills, serving as receptacles for small quantities of gold dust.

This party consisted of Dr. Russell and his brother, Green Russell, A. T. Lloyd, G. W. Kiker, Chas. Kiker and P. H. Clark. Early in 1850 they crossed the range by the Bridger pass and went on to California. In the spring of 1857 they, with others, sold out their interests in California and returned to Georgia. Before separating, it was agreed among several of them that in the near future they would form a prospecting party to go to western Kansas and search for gold.

In May, 1858, eleven of them met at the Planters House in St. Louis. In addition to the original seven there were present J. A. O'Farrell, three men of the name of Chastine and another called Fields. All save two were old Californians. Late in June they left Camp Harney, accompanied by an escort of twenty men under the command of Captain Lyon. In August the party reached the log cabins on the Platte and went to the places where Russell and his friends had found gold in 1849. Sufficient was found to encourage them. Prospecting parties were then organized. It was too near winter to begin serious mining. They returned to camp. Six of the party went East to procure provisions, returning in the spring of the following year—1859.

This was the year of golden discovery. By the close of 1858 rumors of rich diggings had crossed the plains, the rush had set in and crowds began to arrive. Among these came John Hamilton Gregory, who, with J. M. Cotton and his brother William Cotton, went up Clear creek and discovered the outcrop of the Gregory lode on the 6th of May, 1859. This date is the birthday of Colorado's mining industry.

The discovery of the Gregory lode was immediately followed by that of other veins, whose production in the succeeding years made Gilpin county the leading gold mining district of the Rocky mountains.

In the meantime bands of prospectors had scattered all over the neighboring hills and were finding the gold depositories whose later developments made the counties of Clear Creek, Boulder, Gilpin, Summit, Park and Lake one great mining region. * *

In 1874 W. H. Stevens and A. B. Wood came over the range from Fairplay, where they were mining, to build the Oro ditch. When examining California gulch, Wood found float consisting of carbonate of lead ore and began digging on the south side, now known as Dome hill, on what was afterward the Rock claim. He sank a little shaft through the drift which covered the outcrop at a point subsequently worked by an open cut. He found ore in place, but low grade. This was in the fall of 1875. He made arrangements to have some work done that winter, and this led to the uncovering of the outcrop across California gulch up Iron Hill. The next year the whole line of outcrop claims was located on the supposed vein. In 1878, also, George Fryer sunk a hole on a hill north of Stray Horse gulch and found carbonate ore, uncovering in this act the great ore measure which, as "the first contact," proved one of the most remarkable bodies known in mining geology. A month later Rische and Hook happened to sink a hole where the contact approached the surface and found the ore body which subsequently became the Little Pittsburg mine and the foundation of Tabor's fortunes. Other discoveries followed fast. That year (1878) Leadville's output exceeded in value three millions. In 1887 it culminated in an output estimated to be worth $13,500,000. Up to date its yield has been $215,000,000.

In the meantime other mining camps were being born. In the fall of 1872 veins were found near Rosita in Custer county, and in 1877 the Bassick began to produce, creating the excitement of Silver Cliff. * *

During this period the mining industry of Colorado was going through the troubles of its early youth. The history of Gilpin county is so typical of this phase of its development that I have reserved it for special description.

Following upon Gregory's discovery, other veins, subsequently famous, were found. On the 15th of May the Bates' lode was uncovered, on the 25th the Gunnell, Kansas and Burroughs. The Bobtail was discovered in June. The early mining operations consisted of the removal of the soft decomposed croppings, which were washed in sluices, after the fashion of ordinary placer mining. The harder outcrops were crushed under trip-hammers until arrastras were introduced, to give way in their turn to primitive stamp mills. By the first of July, 1860, there were sixty mills in operation. Everything proceeded serenely. But the gossan gave way to pyritic ore as the discovery shafts penetrated deeper and the saving of the gold became more difficult. In spite of these drawbacks, the richness of the upper portions of the first found lodes was such as to leave a handsome margin and maintain a steadily growing population. In the winter of 1863 and the spring of 1864 several mines were sold in New York and Boston. A stock mania supervened, only to collapse suddenly in April. At this time, also, came the period of incoherent processes with the promise of 100 per cent extraction. Some of their progeny still survived, uttering claims nearly as magnificent. The inexperienced chemist, with his revelation for cheap ore reduction, continued what the stock jobber had begun. The mining industry of Gilpin was crippled unto death.

At this time the easily amalgamated surface ores had in many instances become exhausted, giving place to hard pyritic material which refused to yield up its contained gold. Extraction in the stamp mills continued to become worse. Many mines were compelled to close down, others were operated at a ruinous loss of the gold in their ores. A depression fell upon the district, which was not removed until 1868, when a general revival began. The leasing of claims by working miners led to new discoveries, and the consolidation of adjoining territory diminished expenses. At this time the smelter came to the rescue of the baffled mill man. * * * *

This represents a stage of progress common to all our mining regions. Crude milling methods gave way to fire reduction processes and the latter, by their heavy charges, invite the millman to improve on his cheaper methods, so that competition is restored. The smelters saved the mining industry of Gilpin county when it was on the verge of utter collapse. And on the restoration of prosperity the owners of the stamp mills were enabled to carry on experiments where expense was met by the sale of ore to the smelter, so enabling them to evolve a method of stamp milling which was well adapted to the treatment of the heavy pyritic ores produced by their mines. In 1871 the problem had been solved, and to-day 500 stamps do excellent work with the low-grade ore of the district.

Gilpin county has produced about $68,000,000 to date.

While these problems were undergoing solution mining was winning fresh territory southward amid that great complex of mountains whose waters drain into the San Juan river. * * * In the spring of 1871 lode mining may be said to have commenced by the discovery and location of the Little Giant vein, just above the present town of Silverton, by Miles T. Johnson. In the following year an arrastra was built and the gold thus extracted out of the ore was taken for sale to Conejos, the nearest trading station. In 1874 was commenced the erection of a smelter, the machinery of which came on burroback from Colorado Springs, where the Denver & Rio Grande Railroad had just reached. The ore supply of this smelter came principally from the Aspen, which at that time was the chief mine in the locality. * * *

In the meanwhile Gus Begole had crossed the western range from Silverton and, descending into the valley of the Dolores, located claims which later became the Yellow Jacket and Aztec mines. But the ore was too low in grade and work soon ceased. In 1878 John Glasgow and "Sandy" Campbell came northward from La Plata City and began the successful development of the Grand View and Atlantic Cable, causing the growth of the town of Rico. The news was spread abroad that another Leadville had been found, and crowds trooped in across the hills during the summer of 1879. In the fall of 1880 the smelter began operations. Nevertheless, the district would have gained but slight distinction had not the ore deposits of Newman hill been found. These began to be productive when, on the 6th of October, 1887, David Swickheimer struck the big ore body of the Enterprise mine.

In June, 1870, gold was found in Wightman's gulch. This led to the location of the Little Annie in September, 1873, and the opening up of the Summitville district, which is tributary to Del Norte, whose position made it a natural gateway to the watershed of the Rio Grande.

And so we come to recent times, no less stirring than the old. The history of the last decade centers round the discovery of Aspen, the stories of Creede and of Cripple Creek, the collapse of silver mining and the development of new gold fields.

N. C. Creede found the float of the Holy Moses vein, on West Willow creek, a tributary of the Rio Grande, in 1890. As a consequence, the King Solomon district, as it was then called, began to attract the prospectors scattered in the mountains above Del Norte. No important results ensued until in June, 1891. D. H. Moffat and Capt. L. E. Campbell came to Wagon Wheel Gap to visit the Holy Moses, on which Mr. Moffat had secured an option. Creede was engaged to prospect for them. Shortly afterward, Theodore Reiniger made a discovery on Bachelor Mountain, and located it as the Last Chance claim. He did not realize its value, but Creede, who happened along, saw an outcrop which marked the hanging wall of a vein whose debris was scattered around. At a depth of 2 feet he found very good ore and on the 8th of August he located the Amethyst claim. A very little work proved up a magnificent vein and as a consequence the camp sprang into tremendous activity culminating in the boom of 1892. The immediate extension of the railway from Wagon Wheel Gap stimulated a production which reached its maximum in an output of $3,100,000. Then in the summer of 1893 came the sudden fall in silver and a collapse from which Creede has not yet recovered.

Creede and Cripple Creek were rivals in attracting attention during 1891. Both have had strange vicissitudes. Our new gold field lies on the southern slope of Pike's Peak, whose snow-clad crest was the beckoning guide of the pioneers of 1853. Although no gold discoveries of any moment were made in the early days among the streams, or on the hills lying at the foot of the old Beacon Mountain, it nevertheless gave its name to the mining excitement of that period. This has, however, of late, justified the expectations of the tenderfeet of forty years ago.

The first recorded locations were made in February, 1891, but the clustering hills which are now dotted with productive mines had been disturbed by the miner's pick as early 1874. Silver ores were found in a shaft located close to the present Elkton mine. Ores rich in white metal have been found in late years, and the Moose made one shipment of thirty tons, carrying an average of seventy ounces of silver, in addition to the gold.

Ten years afterward, in April, 1884, the district was the scene of the queer fiasco which has gone into local history as the Mt. Pisgah excitement. A crowd of four thousand men were brought together on the rumored discovery of rich placer ground. Nothing was found save in the holes of the original locators. Man had endeavored to remedy nature's niggardliness and poor rock had been artificially enriched. Lynching was threatened, but in the failure to catch the perpetrators a big picnic took place, after which the hill slopes again became the quiet cattle ranges for which they seemed best adapted. Those deluded prospectors let slip a great opportunity. Mt. Pisgah's dark front now overshadows the busy streets of the town of Cripple Creek, and, on the ridges opposite, line after line of smoking chimneys bespeak a long succession of productive mines.

During the spring of 1891 Cripple Creek began to receive respectful mention in mining circles, but the discoveries made at Creede during that summer diverted attention from a district whose previous experience had given it an unsavory reputation. When, however, the silver market collapsed in June, 1893, and mining seem prostrated, the men of Aspen and Leadville turned with the energy of despair to the new gold field which previously had been poohpoohed, and the concentrated activities of the State were directed to the development of Cripple Creek. With a rare good fortune the new camp answered to the call, and, as explorations extended, there came a swift succession of rich discoveries which caused the output to spring from $583,000 in 1892 to $2,100,000 in 1893. This growth continued so that in 1894 the yield was $3,900,000, and in 1895 it reached $7,800,000. These figures are sufficiently eloquent of the development of a district which today is the largest producer of all the gold mining camps of the United States.

During the past three years discoveries in other parts of the State have received attention, and large claims have been made in behalf of several new districts. West Creek, Cottonwood, Hahn's Peak and the Gunnison region may be cited. Of these the last named is much the most important. At the headwaters of certain streams, tributary to the Gunnison river, there have been found veins which are now supplying several stamp mills with pay ore, and have given birth to the settlements of Vulcan, Spencer, Iris and Dubois.

While the new territory which has been won during later days adds its tribute of gold and silver to the old established mining centers, it must be noted that the latter have also accommodated themselves to new economic conditions. The Silverton district, in the southwest, for instance, which in 1892 yielded gold worth $155,624 and silver valued at $354,125, gave in 1894 gold amounting to $360,320 and silver worth $235,000. This is typical of the changed conditions regulating the industry. It is a striking evidence of that resourcefulness which has enabled the State to overcome difficulties. The collapse of silver mining led directly to an impetus in the search for

gold, and the variety of ores so puzzling in the infancy of our smelting industry is to-day its chief aid, because it enables the attainment of that admixture of material which is the essential of successful reduction.

Colorado has yielded to date gold valued at $137,475,000, and silver having a coinage value of nearly $400,000,000.

Thus from humble beginnings a great and complicated industry has been created. Its development may be summarized in four periods, the discoveries in Gilpin county and the adjoining camps in the granitic rocks of the Front range, the era of silver mining in the carboniferous limestones of Leadville, Aspen and Rico, the development of the fissure veins in the andesites of the San Juan, and, lastly, the revival of gold mining consequent upon the uncovering of a great series of ore deposits in the volcanic complex of the Pike's Peak region.

Mine and Mill Reports.

Following are convenient forms of weekly and monthly mine and mill reports that may be of use to some who wish to prepare concise and comprehensive reports of work done. They were prepared by and are published with permission of a prominent mine superintendent:

BLANK GROUP OF MINES.

MONTHLY REPORT.

June, 1896.

2606 tons of ore were crushed with assay value of $13 00.....$33,878 00

Mint returns from free gold caught on plates.	$ 9,682 90	
Gold bars in transit (estimated)	2,238 10	
291 tons concentrates at $55 00 per ton	16,005 00	
Lost in tailings	3,127 00	
Free gold caught in boxes, moisture, etc	2,825 00	
		$33,878 00

RECEIPTS.

Free gold saved on plates	$11,921 00	
291 tons concentrates at $55 00 per ton	16,005 00	
		$27,926 00

EXPENDITURES.

Mining and Development.

Labor	$6,346 25	
Powder, fuse and caps	275 60	
Candles, nails, tools, etc	250 46	
Lumber and charcoal	137 50	
Oil	22 72	
Stulls and lagging	270 00	
Feed mine mules	25 00	
Team, 20 days (hauling lumber)	30 00	
Office and superintendence	175 00	
		$ 7,526 53

Milling and Reduction.

Labor	$1,248 00	
Supplies, sundries	48 48	
" oil	25 00	
" quicksilver	25 00	
" screens	47 52	
" wood	345 00	
" charcoal	16 20	
Wear Shoes, Dies, etc., 10 cents per ton	260 00	
Mint charges	65 00	
Postage on bullion	16 52	
Chlorinating 291 tons contrates at $5 per ton (estimated)	1,455 00	
Loss 5% value of concentrates (estimated)	800 00	
Hauling ore, 40 cents per ton	1,042 00	
Office and superintendence	175 00	
		$ 5,569 32
Net profit	14,830 15	$27,926 00
Profit of the boarding house	$ 354 14	
Total profit for the month	15,184 29	

CHLORINATION DEPARTMENT.

There were treated 352 tons roasted ore at $57 94 per ton		$20,394 88
Mint returns from chlorination gold	$10,934 35	
Chlorination gold in transit (estimated)	8,460 76	
Lost in tailings	806 70	
Unaccounted for to balance	193 07	
		$20,394 88

Percentage of recovery, 95%.

REPORT FOR THE WEEK ENDING.....1896.

.....1896.

TO THE DIRECTORS:

Mine:

There were employed in and around the mine an average force of.....men, at a daily cost of $.....; .....of these were employed on development work, and the remainder on the extraction of ore and permanent improvements.

STATEMENT OF PROGRESS—DEVELOPMENT WORK.

No. 2 east, - - - - - total length....ft.; weekly progress....ft.
No. 2 tunnel, east drift, - total length....ft.; weekly progress....ft.
South crosscut, - - - total length....ft.; weekly progress....ft.
West drift, bottom of shaft, total length....ft.; weekly progress....ft.
East drift, bottom of shaft, total length....ft.; weekly progress....ft.

The faces of both drifts in the shaft are looking well, there being about.....inches of ore in each face. The face of No. 2 east also shows about.....inches of ore.

Reduction Plant:

There were employed in and around the plant an average force of.....men; .....of these were employed at the regular operations of the mill, and.....in the permanent improvement of the plant.

Stamp Mill:

Following is the result of the stamp mill operations for the week ending at 7 o'clock A. M. of.....

There were crushed 570 tons of ore at $9 90 per ton		$5,643 00
Free gold saved on plates (estimated)	$2,875 00	
44¼ tons of concentrates at $50 00 per ton	2,212 50	
Lost in tailings	473 00	
Not accounted for to balance	82 50	
		$5,643 00

Of the $2,212 50 gross value of concentrates 95% or $2,102 00 will be saved in the chlorination, which will make the total recovery of gold for the week amount to $4,977 00.

Chlorination Department:

There were treated 66¾ tons of roasted ore at $71 00		$4,739 25
Lost in tailings $4 20 per ton		280 35
Total recovery		$4,458 90

Percentage of recovery, 94%.

Respectfully,

.....Superintendent.

Gold Mining Coming to the Front.

Written for the MINING AND SCIENTIFIC PRESS by DAN DE QUILLE.

The world appears to be entering upon a mining era. The increased activity in the industry of mining the precious metals, which has been observable among men of capital in the Western world, is quite marked and operations in the shares of mining corporations have become a leading feature of the exchanges of the principal financial centers of Europe. Even the slow-moving peoples of the Orient are awakening to the importance of gold and silver mining. In China, Japan, Korea and other oriental countries steps are being taken looking to the development of their resources in the way of precious metals. In India the ancient gold mines are being reopened and worked and prospectors are now pushing their way into the little-known mountain regions bordering upon Thibet. Men of capital and mining experts are already going into Siberia, where the rich alluvial gold fields along the Amoor river have long been profitably worked, in anticipation of the completion of the great Russian railroad through that country, when the gold and silver veins in the elevated regions above the placers and on the rocky steppes of Mongolia may be exploited.

The English, however, are at present more active in the industry of mining for the precious metals than the people of any other nation in the world. There is a reason for this. The fact is that there now exists great business stagnation throughout all parts of Great Britain. The complaint of dull times is universal and extends to all her leading home industries—agriculture, manufactures, trade, commerce, all are depressed to an unprecedented degree. Even her coal and iron interests are suffering severely and have been going down for eight or ten years. Finding their lands and shops and many of their other home industries affording them scanty profits, they have seen the necessity of looking out for some kind of business that would yield them some return for money invested.

In every hemisphere and under every zone English companies are now to be found opening up and working mines, the English expert being there also, searching after others wherever paying deposits have been encountered. Such has been the success of the English in mining ventures in Australia, South Africa, India and America, that the majority of the rich and well-to-do people in England are now more or less interested in mining, London being the grand center of operations in the mining enterprises of nearly every country on the face of the earth. No matter where the mines dealt in are situated, it is in London that the chief office is located and there most of the directors reside. Also to London comes the bullion from the gold and silver mines and thither all reports are sent.

The English own many excellent paying properties in California and other Pacific coast States and they are constantly adding to the number of their holdings. In the future, as things are now going in the business world, English purchasers are likely to be more numerous than ever before in the Pacific coast region. The troubles in South Africa and the almost insurmountable obstacles to mining in West Australia will turn many among them in this direction. If there is salvation for failing England, it lies manifestly in the industry of gold mining. In this business the growing manufactures of other countries will not much affect her, as she will have nothing to fear from over-production or competition. In mining her people may continue to enrich themselves, even while other sources of their prosperity and power are being dried up. That a people so sagacious will not be long in discovering this fact, nor slow in availing themselves of these outlying opportunities to recuperate their waning strength, may well be believed.

As at present conducted, the risks to be met and faced in mining are not so great as in many others of the leading industries which engage the attention and command the capital of men of business. In commerce the chances taken in sending forth ships to face the storms and perils of every sea are greater than any to be met with in the working of a mine. In dealing in railroad shares and in operating in wheat, oil and other products in the leading markets of the country in accordance with the present methods, there is far more danger of loss and sudden ruin than is possible in working a mining property. Indeed, mining is even safer as a business than farming—the oldest of all the industries, and that in which greater numbers of the people of all nations are engaged than any other—for the farmer is in danger of loss from the time his seed is put into the ground—loss from drouth, insect pests, hail and other storms, frost and the like—and then, when a good crop has been secured, the chances are that prices will be so slow that there will be no profit on the products of the farm when marketed.

In America the capitalists of the great financial centers do not give that support to the mining industry which is accorded it in London, Paris, Berlin and other cities and towns across the water in the Old World. Here the attention of the moneyed men of the big cities appears to be principally devoted to mining the pay streaks in the products of farm and plantation and in driving for bonanzas in Government bonds. However, there is observable a growing interest of late in mining, particularly in gold-producing sections. Many persons are purchasing mines in the great gold field and are using large amounts of capital in the development of country. These men come from no particular center, but from the country at large. As gold mining is about the only industry in which capital can now be invested with any hope of profit, the number of Eastern investors in gold properties is likely to rapidly increase. The fact that many Eastern people own, control or have large interests in some of the best paying mines on the coast will no doubt encourage others who have idle money to come west and assist in the development of our immense gold field.

This gold field extends from the north line of Mexico to the northern limits of Alaska on the Arctic ocean in length, and in width from the eastern base of the Rocky mountains to the Pacific ocean. Every foot of this region is not auriferous, but it comes as near being so as does the territory of any other gold-producing country. It is a region of great and unknown possibilities. In it is room enough for all who may elect to come.

One coming to our mines has choice of a wide range of climate, scenery and soil. He may settle in one of the valleys of the mountain region lying between the Rockies and Sierras, may make his home beside an Alaska glacier or pitch his tent among the orchard and flower gardens of California. Everywhere there is an abundance of room; even in California, the oldest of the mining States, there are vast areas that lie as untouched and unknown as in the "days of '49."

A Miners' Association Headquarters.

A correspondent writes as follows to us in reference to Secretary Sonntag's communication as to what the Miners' Association has accomplished and its needs, which we published September 12th:

I have read with much interest the article in your paper on the value of the Miners' Association to the public and I am fully in accord with the suggestions therein expressed. Its services to the mining interests of the State are not properly appreciated by the public generally, and especially by many of the outlying counties which have been backward in contributions to its support. Its members have given their time, energies and money to the objects of the Association with unselfish zeal that deserves the recognition and highest praise of the public and of every miner in the State. Its efforts in the cause of mining interests have done much already to improve the condition of the miner, but there is a great deal more to do: to eliminate the unjust decisions and rulings of the departments at Washington against him, arising in a great measure from ignorance of the questions coming before them.

The demand for the appointment of a Mining Secretary in the Cabinet is one that should meet with the approval of every mining man on the coast, and should be made the subject of an appeal to the next Congress by a petition circulated and signed by the people of this State, as well as by the adjoining States and Territories. Let such a petition be started in every town and mining district in the interior. No doubt the editors of all the newspapers would aid in the cause, by opening such papers for signature at their offices.

I cannot quite agree with Secretary Sonntag of the Association as to the policy of opening a Bureau of Information, connected with the office of the Association under its present limited means, for to equip such a bureau and maintain it would cost no small amount of money. Again, what is the present Mining Bureau for except to supply information to the mining community and the public, which it is eminently fitted to do by reason of its facilities in the way of an extensive library and statistics gathered by experienced experts at an expense that would be ruinous to the Association, to say nothing of the cost of such a library as the Mining Bureau possesses, which it has taken years to collect and has cost many thousands of dollars. No one man could be found whose head would contain all the information required by the thousands that visit the Mining Bureau.

The most feasible plan and one that would cover the ground would be to move the Mining Bureau to a more central location down town, in connection with or adjoining the rooms of the Association, where easy access to all required information could be obtained at no expense to the Association. The present location of the Mining Bureau is very objectionable and unfitted for the convenience of the public and should be moved to a more central point anyhow, aside from the suggestions named. It has not been able to select a more convenient place for want of funds, as the appropriations have been too limited, and the most rigid economy has had to be practiced to enable it to carry out the objects of the Bureau in gathering the surprising amount of statistics and information it has been able to on such a limited appropriation. It is hoped the next Legislature will be more liberal in its appropriation to this valuable institution.

Note on a Shaft Fire and its Lesson.*

By ROBERT GILMAN BROWN, Bodie, Cal.

There are few disasters so difficult to deal with as an underground fire. It is inaccessible at best, and generally unapproachable; and it finds most material in the very places where it can do most harm, namely, in large stopes and in "heavy" ground where timbers are massed, and in shafts and level stations where there are inevitably strong drafts to make the burning yet more fierce.

The fire constituting the subject of this note occurred in the shaft of the Standard mine at Bodie, California, and originated after the departure of the night force at 3 A. M., being discovered by the men going to work at 6:30. At that time it had gained already considerable headway, and was throwing smoke plentifully from the collar of the shaft.

It must be premised, for understanding of the situation, that in this shaft all hoisting is done to the 320-foot level, where the material is dropped by chutes 30 feet to the tunnel level, through which it is run to the mill. Hoist and sheaves are all placed underground, the upper portion of the shaft being open, but unused. The tunnel is 1800 feet long, and attempts were made at once to reach the shaft through it, but increasing smoke and gas drove the men back a hundred feet and more.

The natural course in such a case is to bulkhead everything as tightly as possible, with the hope that the fire may be smothered in its own carbonic acid, but in this instance the element of uncertainty was too large. There was a nest of old timbers in ore chutes and shaft, above tunnel level, where fire would lurk for months; and, more than that, there were a dozen connections through caved stopes to neighboring mines that could not be bulkheaded as well as through openings that perhaps could. The shaft must, therefore, be approached at the ore chutes on the tunnel level, if possible; and this might be made possible by leaving the tunnel as the sole free intake. All other openings, to the surface direct and through other mines, were at once sealed, with the hoped-for result. In the course of two hours the chutes could be reached, and a hand-to-hand fight with the fire could be begun. In this struggle important aid was furnished, absurd as it may seem, by hand extinguishers, and the drug stores of the town were ransacked for bottles suitable to hold acid, while the assay office furnished the soda for numberless charges. At first water was brought in in barrels, and a hand force pump was used. Later, connections were made from the outside to the mine pipe which passed out of the tunnel, and water was pumped in, to be thrown upon the fire, through a 2-inch hose, by a small centrifugal pump driven by electricity. The latter arrangement was put into operation on the second day of the fire. By this time the chutes and shaft at tunnel level had caved down, and the fire in the half-buried timbers had to be fought for a day or two more, the fear being that it would work down the shaft.

Meanwhile water was being pumped from a neighboring mine through fire hose into the collar of the shaft, which, spattering and spraying down, finally saved the upper 200 feet of it.

The damage was ultimately found to extend upwards from tunnel level, where the cage had wedged, and to include the chutes and hoist station. This must be regarded, in view of the much greater disaster threatened, as a most fortunate and satisfactory result.

By way of deducing for general application the lessons taught by this experience, it may be well to classify the elements which combined to lessen the injury incurred under the two heads of existing conditions and active relief measures.

Existing Conditions.—These might well be called adventitious or accidental circumstances, since they can scarcely be said to have been provided deliberately with a view to the emergency in which they came into play. Apart from the conditions involved in the nature of the mine, the locality of the fire, etc., they comprise:

a. The wedging of the cage just above tunnel level.

b. The presence of a water pipe in the tunnel, with outside connections to adequate water supply.

c. The possession of a centrifugal pump and electric motor that could be put into operation almost immediately.

d. The supply of water from a neighboring mine, and sufficient hose to bring it to the collar of the shaft.

Relief Measures.—Under this head may be mentioned:

e. The bulkheading of all approaches save one.

f. Fighting the fire with hand extinguishers.

g. Hauling in water and using hand force pumps.

These two categories are not food for pleasant consideration, yet it is safe to say that the conditions of 80 per cent of the metal mines of the West are today no better.

It is clear that the first list, which really made the fight a winning one, deserves special consideration, with the view of converting its elements into relief measures for future application.

a. Some years ago a fire door, with automatic release, was devised for use in shafts, and actually employed in several instances. It was 8 inches thick and iron sheathed, and was designed to save a shaft from burning with the shaft-house. Some such device, placed between levels as well, would be invaluable in isolating various portions of the shaft.

b. Where adit tunnels exist, outside connection to water supply should be provided and fitted with couplings and hose, if the conditions are such that in a possible contingency this supply may be required.

c. If pressure is not ample for this purpose a small hand force pump (about 3-inch barrel), or, if there is electric power in the mine, a 3 K. W. motor with 12-inch centrifugal pump should be at hand.

d. For surface water supply a main should be laid, when practicable, from some neighboring mine, with such connections to pumps and hydrants that water can be furnished by either mine for the other's need. This seems to be a fair case for co-operation among several adjacent properties, lessening the expense and increasing the efficiency of protection against fire.

In the case under consideration relief measures would have been more effective if the means had been more promptly at hand, and hence the following observations:

e. Underground connections with other mines are to be avoided; but where they exist they should be fitted with heavy, air-tight bulkheads, with passage traps if necessary. Main airways should be supplied with tight doors. In stoping close to boundary lines it should be a first principle that a solid pillar of rock between mines is the best of protections, since ordinary filled ground will leak enough air to keep a fire alive for months.

f. A hand extinguisher should be kept at every dry station.

g. A tank car and a hand pump should be at hand for use in tunnels or levels.

A few hundred dollars invested in simple provisions of this kind would serve as a most efficient insurance premium.

Mr. Channing has written adequately of the advantages of close bulkheading, which will unquestionably remain the standard method of fighting underground fires; but there are cases, like the one here described, in which the complete exclusion of air is not practicable. In such cases the policy outlined above is worthy of consideration, namely, that of choosing the best point of attack and partially bulkheading, so that fire and gas may draw away therefrom, making approach possible from that quarter. At the time of this writing, exactly a month after the breaking out of the fire, the shaft, from 15 feet above tunnel level downwards, is open and is operated by a temporary hoist; the old hoist station, which had caved full, has been opened; the machinery has been removed and is now undergoing repairs, and for three weeks ore-mining has been recommenced in the upper levels, the product being handled through improvised chutes. With attempted bulkheading we should have been entirely excluded from the mine, and to-day but just beginning to be able to estimate our loss.

*Trans. Am. Inst. M. E., Colorado meeting, September, 1896.

Scientific Progress.

Transcontinental Arc.

A telegram comes from Washington to the effect that the Coast and Geodetic survey has just concluded its labors in the field upon the geodetic survey undertaken and known as the Transcontinental Arc, and lies along the thirty-ninth parallel of north latitude, extending from ocean to ocean. Its eastern end is at a point on the Atlantic ten miles south of Little Egg Island lighthouse, below Cape May, and its western end is six miles north of Punta Arena lighthouse, on the Pacific, above San Francisco. According to the radius of the thirty-ninth parallel, as given by Bessel, the astronomer of Germany, who first calculated the diameters of the earth, and measured the distance from the earth to 61 Cygni, the nearest fixed star, the length of the arc, as measured by the Coast and Geodetic Survey officials, is 111 feet in error, and according to the radius of the same parallel, as fixed by Sir Andrew Clarke of Glasgow University, the error is 98½ feet. But General Duffield, superintendent of the survey, declares that these variations from the heretofore established standards show error in them, and not in the calculation of his scientists.

The value and vastness of the work just accomplished cannot be intelligently appreciated by the unscientific mind. It was inaugurated by the survey officials nearly, if not quite, a century ago. Progress upon it has been spasmodic, but some work has been done every year since the beginning. It has cost the Government about $1,000,000, but the expenditure is said by the officials to be fully justified by the importance of the project. Russia and China are the only other countries on the globe where a base line of anything like equal magnitude is possible, and in neither one is it likely to be surveyed for many years. The longest base line heretofore surveyed was that in India, running north and south about a thousand miles in length. European scientists have been greatly interested in the progress of the American arc, and its completion will doubtless be the occasion for many congratulations from abroad.

Accuracy of Chemical Analysis.

F. P. Dewey of Washington, D. C., in a paper read at the September meeting of the American Institute of Mining Engineers on "The Actual Accuracy of Chemical Analysis," gives many illustrations of the different results obtained by different chemists from the same substance. In one case of examination of gold and silver in copper materials he says: "Summing up, we have twenty-six results by twenty chemists, working by two main methods, each by a single chemist, varying from 135.38 to 122.88, and averaging 127.94 ounces per ton; the extreme variation was 12.5 ounces per ton, or 9.77 per cent of the average determination.

In the case of the silver assay of the copper borings, nine chemists reported by the scorification method, with and without corrections. The averaged results varied from 164.35 to 154.40, and averaged 159.36 ounces per ton; the extreme variation was 9.95 ounces per ton, or 6.24 per cent of the average.

Fifteen chemists reported sixteen results by combined wet and scorification methods, with and without corrections. The averaged results varied from 161.40 to 148.50, and averaged 156.48 ounces per ton; the extreme variation was 13.9 ounces per ton, or 8.88 per cent of the average. A single chemist reported 161.35 ounces per ton by combined wet and crucible process, corrected for slag and cupel.

Summing up, we have twenty-six determinations by twenty chemists, working by three methods, ranging from 164.35 to 148.5, and averaging 157.67 ounces per ton; the extreme variation was 15.85 ounces per ton, or 10.05 per cent of the average determination.

Twenty chemists, working by the four methods, reported twenty-six results on the gold in the matte, varying from 2.41 to 1.85, and averaging 2.245 ounces per ton; the extreme variation was 0.56 ounce per ton, or 24.94 per cent of the average.

On the gold in the copper borings, twenty chemists, working by two main methods, each one variously modified, and the combined wet and crucible method by a single chemist, reported twenty-six results, varying from 0.501 to 0.205, and averaging 0.307 ounce per ton; the extreme variation was 0.296 ounce per ton, or 96.4 per cent of the average determination.

Mr. Dewey quotes some tables of results on soil analyses, published by the Association of Official Agricultural Chemists, one of which is as follows:

TABLE OF AVERAGES—SOIL SAMPLE NO. 2.

	PROVISIONAL METHOD.						HILGARD METHOD.					
	No. included		Average	Highest	Lowest	Difference in per cent of Average.	No. included		Average	Highest	Lowest	Difference in per cent of Average.

Impossibilities Made Possible.

"Impossibilities made possible by means of the modern inventions in the electrical field" furnished the theme of a lecture by Prof. G. Queroult in the Paris Academy of Sciences. During some of his experiments he hit upon the idea to turn around photographic records and also the series of pictures seen through the kinetoscope, respectively the kinematograph. Having photographed a plant at regular intervals and shown in the kinetoscope the growth, the development of the stem, leaves, buds, flowers and fruit, the same consequence of photographic pictures reversed was presented to the eye of the astonished academicians, who wondered at the fruit turning into flowers, flowers into buds, buds drawing back into themselves and disappearing, the leaves closing, getting smaller and disappearing, the stem getting shorter and shorter, until the earth closed over it. The most incredible things are developed before the eyes of a spectator, if a most ordinary series of pictures is reversed. A drinker takes up an empty glass and replaces it full upon the table; a smoker sees the stump of a cigar flying at him from the floor, takes it to his mouth and sees the smoke originate in the room, draws it up to his mouth and into his cigar, which is gradually lengthened and finally replaced in the pocket. A wrestler, who has probably thrown away his garments, is recovered with them by their, so to speak, walking up on him into their places, while he himself performs motions of

which we can understand nothing, because we never saw these most ordinary motions performed backward; a man, for instance, seated at a table before an empty plate, works hard taking bite after bite from his mouth, until the chicken is whole again on the dish before him, and the side dishes are also returned full to their respective places. In order to fully enjoy an exhibition of the kinetoscope such an exhibition should be arranged alongside each other, the same scenes in regular order in one machine and reversed in the other. It would be advisable, however, to inform the spectators previous to their looking at such a reversed series of pictures, for otherwise they might think themselves the victim of a dream, a hallucination, or something worse.—American Journal of Photography.

SOME six years ago M. Vallot erected on Mount Blanc, 1,400 feet from the summit, or 14,381 feet above sea level, the highest meteorological observatory in Europe. Having made twenty-one or more ascents of the mountain, and obtained observations during three successive summers, he now generally offers the use, not only of laboratory and instruments, but of kitchen and salon, to meteorologists of any nation who care to pursue their investigations amid such exalted surroundings. Intending visitors are advised to provide themselves with a somewhat substantial smelling bottle in the form of a steel tube filled with compressed oxygen, the approved remedy for mountain sickness being to inhale a few quarts of this enlivening element. Four Frenchmen, three Swiss, a German, an Italian, and an American have already availed themselves of M. Vallot's invitation, which is presumably for the summer months.

A SOLVENT for gold and silver which owes its efficiency to the presence of potassium cyanide is claimed by Johnes Atkins, and is produced by heating a dry mixture of one part of potassium ferrocyanide with about two parts of salt to incipient fusion. The product is poured into molds, and is quite stable in the air. For use it is dissolved in water.

THE British Admiralty authorities are still conducting experiments with a view to overcome the difficulties experienced in obtaining satisfactory results with ordinary gauge glasses, owing to the extremely high range of temperature with the new type of boilers. The coating of the inside of the tube with white of egg is stated to have produced the most satisfactory results, by simple means, up to the present.

Electrical Progress.

Manitou Tunnel Power Plant.

During the past few years over fifty companies have installed electric power plants in the Rocky mountains for mining and ore reducing purposes. One of those lately installed is a plant at Manitou for supplying the Strickler tunnel. The station, which is illustrated in the accompanying cut is above the Iron Springs Hotel at Manitou, Colorado, and consists of a 500 H. P. Pelton wheel direct connected to a General Electric Company generator. The wheel runs under a head of 600 feet and is speeded at 600 revolutions.

The power thus generated is carried a distance of eight miles and runs an air compressor for supplying the drills operating in what is known as the Strickler tunnel, which is being driven through a spur of the Pike's Peak range. This tunnel is 6400 feet long and forms a part of the new water works system of Colorado Springs. Operations on the tunnel are carried on from both ends, and light as well as power is supplied from the station for the power house, as well as all underground work.

This is believed to be the first instance in which the resources of water power and electricity have been brought to bear upon a project of this character. The facility it has afforded for the rapid and economical prosecution of the work has been a gratifying surprise to all interested in the enterprise.

The 13-inch main supplying Colorado Springs carries a pressure at the reservoir of 170 pounds, which it is now proposed to utilize, by means of Pelton wheels and electric generators, for lighting the city.

THE usual thing has happened with the French motor-car demonstration. More than two-thirds of the conveyances have already been disabled and have given up the contest. It will be remembered that the same result was the case in the races which took place in the United States, only, perhaps, still more accentuated. The truth seems that we have not yet been successful in evolving an even fairly satisfactory vehicle of this description. Of the three principal types, steam is cumbrous and troublesome; the carriage and storage of light oils is difficult and dangerous, while heavy oil vehicles add to their other disadvantages that of creating a nauseous smell. Add to the foregoing the fact that the vehicles are very expensive, and it will be recognized that the promised street revolution is not likely to create any great shock by the suddenness of its inauguration.—Industries and Iron.

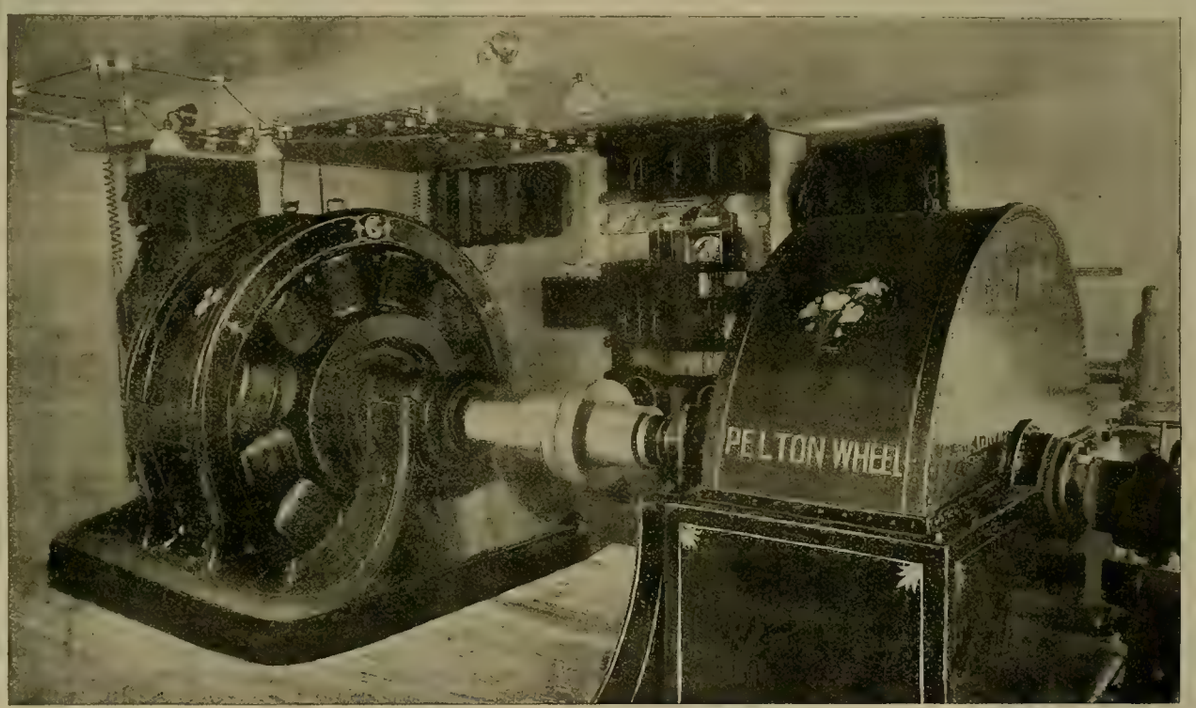
Mechanical Progress.

Hoisting Six Barrels a Minute.

In grist mills and grain elevators there are endless belts, running from a lower to an upper floor, and provided at short intervals with small metal buckets, which scoop up flour or wheat or some similar commodity. In this way transportation is automatically effected. In ore-crushing mills, too, we have horizontal belts, without buckets, to convey material from one machine to another or from a crusher to a bin. Still another form of conveyor is now coming into use. It is designed to handle barrels and grain sacks, and lift them from one floor to another. This device consists of a broad rubber endless belt, from whose outer face project pairs of arms or brackets, the two arms of each separate pair being nearly two feet apart. The barrels or sacks are laid or rolled, one at a time, on to these supports. It is possible to adjust the apparatus so that it will deliver its load at any floor above the starting point.

It is necessary to have an attendant remove the freight as fast as it comes, but the operation of placing the barrel or sack on the floor in front of the opening through which the conveyor comes through the floor is performed automatically. Inasmuch as the belt runs exactly up and down, and not slantwise, and as the brackets are shaped alike above and below, the device can be employed for sending merchandise down again from the storage lofts without reversing the direction in which the belt runs. In fact, both hoisting and lowering can be done at the same time. Eight of these elevators were recently put into a big sugar refinery in Philadelphia. They reach up through eight floors. Each one is capable of handling 375 barrels an hour, or about six to the minute, in either direction. In other words, it is nine or ten seconds from the time that one barrel of sugar rolls off from the belt to the arrival of the next one. These conveyors, of course, can be adapted to the carriage of all sorts of miscellaneous parcels and bundles.

THE utilization of waste slag is one of the great problems of technology. The German Association of Cement Workers has recently taken up the study of this important matter and some interesting progress has been made. In the valley of the Saar a slag of suitable composition is produced and can be properly granulated. Two factories are running on this product. The slag costs about $1.32 per barrel in fifty-ton lots. The slag cement is lighter than Portland cement, and runs about 330 pounds to a barrel. The official tests show that the slag cement gives excellent results in foundation work, but it does not do so well when freely exposed to the sun and atmospheric influences. A good deal of the slag cement is used in making paving tiles, bricks and blocks. These consist of a mixture of gravel, sand and slag cement in various proportions, moulded wet and hydraulicly pressed. The cost of these paving tiles is about 72 cents per square yard. The use of slag in road making is well worth careful attention in this country.



MANITOU TUNNEL POWER PLANT.

NICKEL-STEEL promises to be the building material of the future. For pieces of machinery which may suffer from a sudden fracture its elasticity makes it particularly adapted. It is being largely used in the machinery of locomotives and machine engines. It withstands salt water better than steel. A steel surfaced with nickel is giving excellent results in this direction. By coating nickel-steel with nickel the galvanic action caused by exposure to sea water is avoided. Nickel-steel wire is used for the nets which are hung about men-of-war as a protection against the attacks of torpedoes. The exterior of the rings of the 5000 H. P. dynamos of the Niagara Falls Power Company, which travel at an immense speed, are made of nickel-steel. In cannons it has proved a great success, and also in the heavy armor now used in men-of-war. Unfortunately, the high price of nickel-steel prevents its general use.—The Brooklyn Manufacturer.

A FEW months ago we drew attention to the creation of a large locomotive industry under American auspices and control, four miles from Nijni Novgorod. Now it is announced that an American company has been formed, with a capital of $2,500,000, to secure

control of valuable manganese mines at Nicopol, in south Russia. The one to be taken is close to Mariopal, on the Sea of Azov, where a large steel plant is about to be erected under the supervision of H. S. Lond, formerly of the Illinois Steel Company. The company has, it is stated, already secured an order for 144 miles of oil pipe, amounting to some 10,000 tons, for the Caucasus, and the machinery for the manufacture of this is being shipped from the United States.

Practical Information.

A French Decision on Subsidence.

The owner of some land at Ovion, near Lens, in the Pas-de-Calais, France, under which the Lens Colliery Company has worked several seams, proposed in 1892 to build a brewery; but the Lens Company, asserting that the surface was undermined by workings, served him with a notice to the effect that, in order to warn him of the possible damage by subsidence to his proposed building, for which the company would not be responsible, it offered to agree to an indemnity for the depreciation of his property through becoming unsuitable for building owing to the underground workings. As the owner protested against this attempt to restrict his free exercise of the right of surface ownership, the Lens Company entered an action before the Bethune Civil Tribunal with the object of obliging the owner to receive an indemnity for depreciation, or of disclaiming its liability in the event of his refusal; but this application was refused in February, 1893. On the company having recourse to the Douai Court of Appeal, that body decided, in November, 1893, that a mine owner has the right to free himself of all future responsibility by offering an indemnity for any depreciation caused to property. The Supreme Appeal Court of France, however, has reversed this decision on the ground that the surface owner must not suffer on account of underground workings, but preserves the right to employ and dispose of his property in the most absolute manner, and that it is not for the mine owner concessionnaire to fix the moment for establishing the indemnity for future and eventful damage.—American Manufacturer.

THERE are 70,000 postoffices in the United States, against 20,000 in Great Britain, 25,000 in Germany, 9000 in Austria-Hungary, 7000 in France and 6000 in Italy. The net loss on the postoffice business of the United States amounted last year to $10,000,000, the shortage being made up by appropriation by the Treasury, which has averaged in recent years about $6,000,000. The profit in the English Postoffice Department for the same period was $15,000,000, and other countries of Europe make a profit from the postoffice also. The net revenue in Austria-Hungary was $5,000,000, in Russia $1,000,000, and in France $7,500,000. The revenue of the English Postoffice, including in this amount the revenue from telegrams, which is a Government monopoly in England, was $70,000,000 last year, of which $15,000,000 was from telegrams. The receipts of the American telegraph companies are in excess of $25,000,000 a year, and, if added to the postal receipts, as is the case in England and Germany, would make the revenues of the Postoffice Department over $100,000,000 a year.

PROFESSOR HOGG, of Fort Worth, Texas, writes of the benefits railroads have conferred on the people, and claims that they have cheapened the necessaries of life to consumers. One day's wages will pay the cost of bringing a whole year's provisions from St. Louis to Baltimore. Retail dealers get more profit from handling flour, beef, ham, tea, shoes or clothing than do the railroads for hauling them 1000 miles. They protect us against scarcity prices and famine by supplying the deficiencies of one region from the superabundance of another. They increase the pleasure of life by facilitating travel at rates that suit the poorest purse. American railroads are operated, in fact, at rates that give little or no profit to their owners. Abroad rates are much higher. Freight rates are three times as high in England. Passenger rates show a like advantage to the American traveler. As respects military defense, railroads are immensely beneficial. They save the expense of maintaining a large standing army by the facilities they give for the concentration of troops. In time of war they do an indispensable work in the transportation of troops and provisions with speed and certainty. Professor Hogg, in stating that freight rates in England are three times as high as in this country, seems not to be aware that the charges in England include, not only actual freight, but also the cost of drayage at both ends. Each of the great railways of England maintains an immense number of drays, with the finest draft horses in the world. One who wishes to ship goods from his residence or a warehouse in any part of Liverpool to any given address in London, for example, needs only to give notice to the railway company. Their dray will call for the goods, which will be delivered in London by the company's drays there. The freight charges include all costs of drayage. One great advantage to the shipper is the saving of bother about having the goods taken to and from the depots at the shipping and delivery points, and another is the certainty that the goods will be more carefully handled by the railway company's drayman than they would be by others.

THE exports of British tinplate to the United States during three-quarters of the present year, compared with those for a corresponding period in 1895, show a decrease of more than 46 per cent. Following are shown the total exports of tinplate from Great Britain to the United States for the past five years up to and including September, 1896:

Month—	*1896.*	*1895.*	*1894.*	*1893.*	*1892.*
January.....	11,861	18,626	18,296	23,498	17,554

CONDITIONS point to an increased area and growth of woodlands throughout New England. The old practice of clearing forests and burning the wood for making settlements and homes has passed away. The many acres of rough and rocky sidehill land have already been cleared in generations now past. Thousands of what are called farms would have been doubly valuable had they been cultivated for timber instead of grass. Wood is not consumed for fuel to the extent it once was. Railway locomotives burn coal instead of wood. A vast proportion of the area of New England is natural forest land. Keep out the fires and we may have successive crops of wood and timber for all time. The ax properly handled is the friend instead of the enemy to the forest. Our forest products are only valuable as they may be utilized by civilized humanity.—Northeastern Lumberman.

CAPT. WILLIAM B. HILLER of New York states that on July 1 last he discovered, some 500 miles off the coast of Labrador, the celebrated Leary raft, which was lost some years ago. It was headed southwest, he says, but was not making much headway. The raft is larger than any ocean liner, and it would be an ugly customer to meet under the conditions of a twenty-knot gait and a dark night. Other mariners and the collector of New York laugh at him and declare the raft broken up long ago. James D. Leary of St. John dock fame, who first conceived the plan of transporting lumber at sea by means of a raft, was recently interviewed. "I think Capt. Hiller's story to be very probable. I was employed personally in the construction of this raft, and I know that it was constructed as strong as—if not stronger than—many ocean steamers. Its general compactness and solidity made it almost as inseparable as one great, massive log."—Northeast Lumberman.

IT is stated that the Greek Government has recently received several applications for the granting of mining concessions, and that an English company is negotiating more especially for the concession of an iron mine.

"HISTORY OF CRIPPLE CREEK."

We have just issued in book form the only authentic and reliable history of Cripple Creek gold camp, the marvel of the mining world. The book contains numerous full-page illustrations (with map) of gold mines true to life. With the sole object of introducing our big 8-page 56-column illustrated weekly paper (established 1890) we will send a copy of the above interesting book free to all who send us 25c (stamps or silver), for a 3 months' (13 weeks) trial subscription to our big weekly, which contains the latest mining news and illustrations of Rocky mountain scenery. Club of 5 and 5 books, $1. Mention THE PRESS and address, *Illustrated Weekly*, Denver, Colo.

WILL NEGOTIATE with owners or their duly authorized agents only.

WILL INVESTIGATE only thoroughly bona-fide properties, either Mines, Prospects or Mineral Lands, whose owners are willing to make reasonable terms. When sending reports on properties also send terms on which you are willing to sell or lease.

Coast Industrial Notes.

—The steamer Arago was wrecked at Coos Bay, Or., last Tuesday, while en route to this city, and is a total loss. Twelve lives were lost.

—Last week 500 tons of beans were shipped from San Francisco to Liverpool. This is said to be the first direct shipment of the kind from California.

—The San Francisco Chamber of Commerce is about to memorialize Congress asking a subsidy for American ships to carry mails across the Pacific ocean.

—A proposition to bond Tuolumne county for $100,000 for twenty years, to be used in building a road from Sonora to Knight's Ferry, is before the people of that county.

—The Pioneer Electric Power Company is about to build an electric railway to Salt Lake City, Utah, in connection with its electric transmission line, to be built from Ogden to the same city.

—The first carload of this season's crop of oranges was shipped last Monday night from Los Angeles to Chicago, four weeks earlier than ever before. The fruit is from the Cahuenga valley.

—Santa Barbara Consolidated Electric Company stockholders will hold a special meeting next Saturday on the question of bonding the company in the amount of $150,000 and of executing a deed of trust.

—Henry Hewitt, treasurer of the St. Paul & Tacoma Lumber Company of Tacoma, is going to the Orient to establish branches for his company in Hawaii, Australia, Japan, China, India and South Africa.

—The great rise in wheat culminated last Wednesday, December wheat selling at $1.50; other cereals are higher in sympathy. Flour has advanced from $3.65 to $4.90 per barrel. Shortage in India is the cause of the wheat advance.

—A line of steam schooners is to be put in to run between San Diego and Panama, stopping at way ports. San Diego will be the principal port of entry, and the trade of San Diego and Los Angeles counties will be catered to.

—The deed conveying the title to the Citizens' Railway and the Santa Barbara Street Railway to the Consolidated Electric Company has been filed for record and calls for $35,000, to be paid in bonds of the Consolidated Electric Company.

—Plans and specifications for water and electric works at Anaheim, Cal., are being prepared. As soon as bonds are sold, bids for both systems will be called for. Engineer C. S. Rogers, Anaheim, is preparing the specifications for the water works.

—The South Coast Paper Mills have placed in position the first installment of machinery necessary for the proposed manufacture of manilla fruit and rag wrapping paper. The entire plant for the new process will cost $3000. It will increase the daily output by two tons and give employment to increased hands.

—Eastern capitalists having signified a willingness to invest $300,000 in the proposed electric road between Sacramento city, Orangevale and the Fair Oaks colony, providing the citizens of Sacramento would take $50,000 of stock, that sum was raised with but little trouble. It is understood that if satisfactory arrangements are made, work will be commenced upon the new road immediately.

—The recent exposition at the Mechanics' Institute Pavilion was a financial as well as an industrial success. About 300,000 people visited the Exposition. The ticket office receipts were $35,250. The entire expenses were $27,000. To determine the six most popular exhibits 49,329 votes were cast. The winners were the Joshua Hendy Machine Works, Johnson-Locke Co., American Biscuit Co., Crown Flour Milling Co., Union Iron Works, and Fulton Engineering and Shipbuilding Works.

—In this city last Monday the case of the Oregon & California Railroad Company and others vs. the United States, known as the Overlap Land case, was decided adversely to the Government. Judge Ross rendered the opinion, concurred in by Judge Hawley, reversing the decision of Judge Gilbert of the Oregon Circuit, and remanding the case to the lower court with directions to dismiss. Judge McKenna rendered a dissenting opinion, holding, with Judge Gilbert, that the Oregon & California Railroad Company never had a legitimate claim to the land patented to it by the Government, under the Congressional act of 1866, but the rights of the Northern Pacific Company still existed, under the grant of 1864, because they had never either been exercised or abandoned. The land involved in the case is about 200,000 acres in the vicinity of Portland, Oregon. Because of the divided opinion of the four judges in the matter, the case will probably be carried to the U. S. Supreme Court for final hearing.

—The asphalt deposits in Santa Barbara county, this State, recently described and illustrated in these columns, have been sold by the Alcatraz Asphalt Co. of this city to English investors represented by Percy Tarbutt and Edmund Davis. The three asphalt mines, Las Conchas, La Patera and Sisquoc, contain large and pure deposits of valuable commercial asphalt, some of which has been used on street pavements in this city. The '95 product was 24,000 tons, worth $140,000. The supply is apparently inexhaustible.

Personal.

THOMAS WEIR is the new manager of the Highland Boy, at Bingham, Utah.

E. B. PRESTON of the State Mining Bureau is at Hayden Hill, Lassen county.

LOUIS JANIN, Jr., is expected to arrrive here from London in a few days on his way to Australia.

JOHN TREADWELL has been appointed superintendent of the Keystone mine, in Amador county.

E. J. MURRAY, who has been in Shasta for some time, left last week for Mexico to take charge of the Santa Rosalie mine.

D. B. HUNTLEY succeeds the late Captain John W. Plummer as manager of the De Lamar Mining Co., De Lamar, Idaho.

REAR ADMIRAL J. C. WALKER, representing the navy, A. F. Rogers, representing the Coast and Geodetic Survey, and W. H. Burr, G. S. Morrison, R. P. Morgan, appointed by the President, constitute the commission to determine the location of the harbor for Los Angeles, Cal.

HAMILTON SMITH of the Exploration Company of London, according to present arrangements will arrive here about the middle of next month. It is some six years since he was in California last. Mr. Smith and H. C. Perkins have formed a partnership as consulting mining engineers. Mr. Perkins will make his headquarters in Paris. He was for a time at the North Bloomfield mines, in Nevada county, with Mr. Smith, and has lately been in South Africa in charge of some of the largest mines there. He has made a fortune since he left here.

Recent California Mining Incorporations.

Kaolah G. M. Co., S. F.; C. W. Tyron, J. S. Drake, F. C. Gebricke, H. H. and W. B. Lee; capital stock, $2,500,000, all subscribed.

Golden Bell Mining Co., S. F.; E. L. Berry, C. F. Bunker, G. W. Osborn Jr., H. Nolt, A. G. Walsh; capital stock, $250,000--$25 subscribed.

Confidence G. M. & M. Co., S. F.; M. Schwitzer, A. Hamilton, S. Silverberg, K. J. Turner, F. Quisling; capital stock, $2,000,000, all subscribed.

Anglo-California Mining Company, S. F.; I. S. Cowles, W. McGill, D. B. Chase, J. Dankin, P. D. and C. G. Nagle; capital stock, $2,000,000—$1,300,000 subscribed.

Recently Declared Mining Dividends.

Alaska-Treadwell, 37½c per share, $75,000; payable October 28th.

Alaska-Mexican Co., 10c per share, $18,000; payable October 28th.

The Boston & Montana Mining Company, Montana, regular quarterly of $2 and an extra of $1 per share, a total of $450,000. This makes an aggregate of dividends to date of $4,925,000.

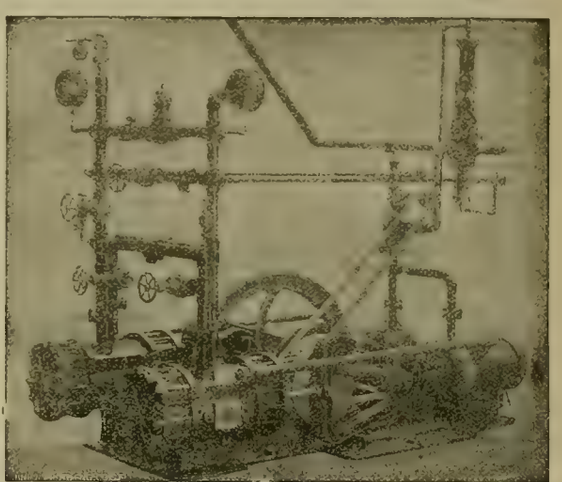
DOUBLE PIPE AIR COMPRESSOR.



This is a cut of the Double Pipe AirCompressor, the Compressor that is guaranteed to save 30% in power over any other make. It is cheapest to buy, cheapest to carry about and cheapest to run. If your fuel or water costs you anything, you want this Compressor. If you can get railroad freights free, and can carry machinery to your mine without cost, and your power costs you nothing, any make of Compressor will do you. You will be under no necessity to write to PNEUMATIC POWER CO., at 306 Pine St., San Francisco, Cal. We could save you money, though, in cost of foundations, as our Compressors are half the size of other makes.

Mining Summary.

CALIFORNIA.

Amador.

The Sunset Mining Co. is about ready to commence operations on the south fork of the Cosumnes river, Amador county. The prospects are flattering as to the yield of gold. The only drawback apparent is the immense number of huge granite boulders to be handled. An experienced superintendent claims that this can be remedied, and the Sunset will soon be reaping rich returns for their outlay.

Republican: Sinking has been resumed at the Alma mine, after a week's prospecting with the diamond drill. The drill was run in an easterly direction about 140 feet, over 20 feet of which was in quartz and ledge matter. A heavy flow of water was also encountered. The quartz is reported to have yielded flattering prospects. The situation was reported to the San Francisco office, and orders were telegraphed to suspend operations with the drill and renew work in sinking the shaft. It is the intention to sink to a depth of 1000 feet, and crosscut to the ledge at this depth. Indications all point to the development of a permanent mine at this point.

Republican: Some twenty to thirty more men have been employed at the large plant of the Blue Lakes Water Company's ground above Big Bar bridge, on the Mokelumne river, making near 100 men. They propose to push everything, in order to get the foundation laid before the rainy season sets in.

Record: C. A. Roberts, who has bonded the Loyal Lead, better known as the Black Hills mine, intends to begin operations right away and to sink a shaft 1000 feet. The contract has been let for timbers and other supplies.

Republican: The Pocohontas mine is down about 80 feet. They are at work sinking a new shaft. Hoisting works will soon be erected.

The White mine, above Big Bar, is running night and day sinking.

At Butte City a 10-stamp mill has been erected, and the mortars are in place, but the stamps are not yet in position. Zambral and Zeek from Cincinnati are at the head of this enterprise.

Ten or twelve men are employed by the Butte Basin Tunnel Company. The tunnel is in 600 feet in hard black slate. The company has built several houses for living and sleeping purposes near Big Bar bridge to accommodate the three shifts of men that are pushing this work. The tunnel is making headway at the rate of 8 to 10 feet per day.

At the Anita mine the east crosscut has been driven 60 feet, with no change in the character of the formation. It was expected to encounter the ledge between 40 and 50 feet, but the ore body is believed to run considerably flatter than was anticipated.

At the Alma they have commenced to crosscut for the ledge at the depth of 800 feet, using the diamond drill.

Quartz mining in the Clinton district is on the increase. The claim owned by the Mason Mining & Milling Co., the stockholders of which are mostly Woodbridge capitalists, was started last week under the management of H. W. Tangerman. Seven men were put to work cleaning out a tunnel 450 feet long.

The Madden and Ratto mines are likely to be started shortly.

The Union Consolidated has started ten stamps of their 30-stamp mill and are going to run day and night. They have commenced to cut stations at the 400-foot level, and will soon commence stoping east and west. The chlorination works are also being fitted up for immediate use, if necessary.

Butte.

Mercury: A 6-foot ledge has been struck at the Denver mine that is very rich. There are thirty men employed on this property.

The Rockford mine at Humbug is reported very rich, and the property will in a few weeks put in an extensive plant to handle the ore.

The rumor of a rich strike in the Golden Queen mine, which recently came into the hands of H. P. Stow, is confirmed. The ledge was struck on the 300-foot level. Mr. Stow, who has over one hundred men in his employ, is so elated over the strike that he has raised the wages of his men to $3 per day.

Fourteen men are employed at the Morning Star mine, above Yankee Hill. They are making extensive preparations for a big run on quartz as soon as sufficient machinery can be had.

Victor Pomerat has a small claim above Contolenc which he has been prospecting. A few days ago his labors were rewarded by an 18-inch ledge of white quartz that will assay very high.

Mercury: On the west side of the Feather river, in South Thermalito, there are three mines in active operation.

George Ditzer has ten men employed, W. P. Hammond twelve men and W. Treat fifty men. The latter are working day and night. The deep, fertile soil is removed in some places to a depth of 20 feet and then the pay gravel is reached below this. The earth is hauled off in wagons or run off in cars moved by steam power.

Calaveras.

Citizen: Hackett, Thompson & De Golyer have paid on the bond on the Don Allan mine $17,000. A 15-stamp mill has been erected, and other improvements made. There is a large body of low-grade ore available on the surface of the mine, and strong indications that it will concentrate and improve in depth. The formation is a blocky porphyry, radiated with quartz kidneys, veins and stringers, the whole mass carrying free gold at one place nearly 300 feet in width. It is reported the test made in the new mill averaged over $4 per ton.

Active operations on the Gum Boots mine, on Indian creek, were begun last week. John Nuner of Mokelumne Hill was awarded the contract to run a tunnel on the ledge for a distance of 150 feet.

Preparations are being made to begin work at the Mienecke gravel mine, near Vallecito, as soon as the winter rains begin. A reservoir is being built and thirteen men are preparing for hydraulicking.

Prospect: The old What Cheer blue gravel mine near Mokelumne Hill has been incorporated and work will soon be resumed. This property, which has been closed for a number of years, was worked more or less by many different companies who in no instance had the money with which to carry on the work properly.

It is reported that there is a 4-foot vein of rich quartz in the winze at the Lone Star mine at West Point.

Chronicle: At the Mitchell mine three shifts are driving the tunnel ahead and good ore is being encountered. A new boarding house and sleeping apartments have recently been built. It is expected to start the mill up on the first of December.

As soon as the machinery arrives, which will be in a few days, active operations will be resumed on the Petticoat mine.

El Dorado.

Nugget: George Clark is erecting a mill at the Saginaw mine. He has made a good prospect of the property and is satisfied that he has a good mine.

The new purchasers of the Amazon mine, near Kelsey, are preparing to work it.

The Lone Jack trouble having been settled, it is expected that the mine will be worked to full capacity in a short time.

Democrat: Beach & Co. have contracted with Greater, Cook and Elvidge to furnish lumber for a 10-stamp mill on a mine in Chili ravine bonded from John Pascoe.

Republican: E. C. Suman has purchased the Probert mine, near Latrobe. This piece of property is a ledge recently discovered there and which furnishes some fine prospects.

The contractors for the American River Co. are busy sending logs down the chute into the river, to fill their contract for supplying 10,000,000 feet. The force is so great that some of the logs checked by exposure to the sun explode and break into fragments on striking the water.

It is reported that the owners are to start the Blue Bird mine, near the Sciaroni.

They are still working the Baltic mine. Sixteen men are employed. The Baltic mill is nearly completed.

Mariposa.

(Special Correspondence).—On the Mariposa grant J. D. Ludwig continues to get matters in order for inspection at the Josephine mine. Some very promising new prospects are being opened up at Mt. Ophir. It is understood that Senator John P. Jones' political engagements will not admit of his accompanying Hamilton Smith on his visit of inspection until after the election.

Chas. T. Lindner, the general manager of the Mariposa Electric Power Company, is now in charge at the camp at Broadhead old dam. Men are at work on the aqueduct, and Mr. Lindner is securing contracts from mine-owners for the use of the power.

The Merced Gold Mining Company continues sinking in the various shafts—three eight-hour shifts in each. The company is testing ore in bulk samples, principally from the Mary Harrison. For this purpose ten head of stamps are kept running at the Potosi mill. Captain Thomas Couch is expected here shortly to resume charge of the company's operations.

Goodall, Perkins & Co. have bonded several more claims at the lower end of Hunter's valley, including the old Dulce mine. In all the claims they have bonded a covenant is made for continuous work, and the scope of their operations is already large. So far as they have gone, they are well satisfied with the prospects. Samples assayed show the rock to be exceptionally rich. What remains to be proved is its permanency.

Capt. A. H. Ward is again at Pinon Blanco. The tunnel driven from the west side of the mountain to intersect the main ledge is now in about 1000 feet with satisfactory results.

J. J. Dolan is back to the Story mine at Date's Flat. He has men at work sinking in the main shaft from the 100 to the 700-foot level. The tunnel which connects with the shaft at the 100-foot level has been finished. Hoisting machinery is expected from San Francisco in a few days.

The Tyro mill continues to run night and day on rock from the 500 and 700-foot levels from the drifts to the northwest side of the property towards the Merced Company's Malvina mine. Mr. Buttgenbach, the president of the Tyro Company, says that the rock now being crushed is equal to anything that ever came out of the mine.

Chas. Blagburn, M. E., is inspecting a group of claims near the Merced river on behalf of an English syndicate.

At the Tendron mine, in the Whitlocks district (Sierra Buttes Co., Limited, owners), the 20-stamp mill is running steadily. Recently the character and quantity of the rock has improved to an encouraging degree.

Work has been resumed in connection with the Washington, No. 9, Pool and Quartz Mountain mines. The work so far is of a preliminary nature, such as pumping out the No. 9, retimbering where necessary, and getting the machinery in order. On these properties there are thirty-eight head of stamps and all the usual appliances.

The Horseshoe mine, in Hunter's valley (Frank Thorne, superintendent), is sinking steadily, and more than paying its way with the 5-stamp mill that is kept constantly going.

The owners of the Louisiana mine are about to erect a 10-stamp mill on the North Fork of the Merced river, having, by sinking, proved the property to their satisfaction.

Coulterville, Oct. 21, '96.

Nevada.

The Old Home Consolidated mine, in the Blue Cut district, has been worked by the present owners for about a year, and they have made important developments. The fissure is 80 feet wide and contains six different ledges, all of which are coming together as greater depth is reached, and which it is believed will unite lower down and form one large, permanent ledge. The main tunnel has been run into the hill a distance of 700 feet and is still being driven ahead. In about ten days the 5-stamp mill will begin crushing again, and it is expected that it will be kept running steadily.

Transcript: During the flush times of high-grade ores little attention was paid to the great mother lode which runs through Washington district. There are now perhaps twenty claims located along the lode, and among the lucky prospectors who have something to show as a reward for their pluck and perseverance are W. L. Williamson and M. M. Cole, who own the Giant King, situated just above the town of Washington. The Giant King has a pay chute nearly 100 feet wide that will average $4 per ton, and has several tunnels running into it. The ledge can be worked and the ore milled nearly as cheaply as at the Spanish mine. John McCarthy and others own the Paris, San Francisco, St. Patrick and Eureka, all on the north side of the river. Practical mill tests show that with proper development and milling facilities unknown wealth may be extracted from the mines along the mother lode. The work done throughout the district has been of a permanent nature and good results can be looked for later on.

Transcript: At the Champion the two mills, with their seventy stamps, are kept running night and day, crushing quartz. There are now nearly 200 men on the company's pay roll, and the number of miners is being gradually increased as room is found for them. The old Merrifield shaft is being opened up, and when everything is ready for breasting out more men will be employed. In three or four months from now the Champion Company will probably have 250 men at work, enough persons, with their families and others that are dependent upon them, to make a small village of themselves.

Transcript: A mill has been erected at the Metropolitan mine at Orleans Flat which was purchased a short time ago from George Abraham by a San Francisco company.

Placer.

Colfax *Sentinel*: The mill at the Herman mine is running day and night. Twenty-seven men are employed. Work is being done in tunnels No. 1, No. 2 and No. 3. Tunnel No. 4 has been started 400 feet below No. 3 and will be driven in on the ledge 1200 feet.

At the Macedon quartz mine, Black Canyon, a tunnel is being run on the ledge that will give them 300 feet of backs for stoping. Ore has been taken out recently that shows free gold.

The Monte Rio river mine, which consists of about 3000 feet of the channel on Bear river immediately above the South Yuba dam about three miles from Colfax, has been sold to E. W. Chapman for a good sum. The mine was owned by the following Auburn citizens: T. B. Corey, Daniel Kirby, J. W. Morgan, J. L. Rollins, Thomas Morgan and Mr. Hazen.

The shaft at the Occidental mine 2½ miles east of Iowa Hill, at Grizzly Flat, is now down about 70 feet. They expect to strike gravel and bedrock in about a month. Wm. Cameron is superintendent.

About sixty-five men are engaged on the surface and development work at the Dam claim.

Plumas.

Independent: The Bunker Hill mine at the head of Hopkins is paying well and North America, with which it is consolidated, is yielding satisfactory returns. Captain Wm. Meikle is in charge of the consolidation which is now called the "Garnett."

At Gibsonville, gravel was struck in the Squiers shaft last week at the depth of 260 feet from the surface.

Work on the new tunnel at the Sunnyside mine in Butte Valley has been resumed. A force of men are also working in the old drain tunnel, and the superintendent is washing gravel with good results.

Shasta.

Free Press: The Shasta Dredging Company not long ago built a boat on which was placed machinery to hoist the sands of the river bottom by means of a suction pump. After a test the work was abandoned, as the machinery did not provide for the penetration and disturbance of the hard cement or gravel. Now another company has been organized to work the river gravel by a different method, using instead of a suction pump a scoop shovel holding a yard of dirt. To this shovel are attached three prongs, which are forced into the hard cement. The company is known as the Tortillata Gold Mining Company and is represented here by Major J. B. Shoenfelt of Wyoming, who expects to keep two crews at work, and estimates that he can move into the sluices 1000 yards of dirt in twenty-four hours.

The Sunny Hill tunnel is now in about 475 feet and is being driven night and day.

At French gulch the Sutter property will start crushing ore in the Washington mill soon.

Four prospectors have discovered the east extension of the Ellery mine, showing 2½ feet of ore that will mill $50 per ton.

The Gladstone is again having a streak of good luck. They let a contract on their long tunnel and have cut the old ore chute that was so phenomenally rich on the surface, at a depth of 900 feet. They have 3 feet of ore that mills $25 per ton. An effort is being made to settle the liens and claims against the mine and resume operations.

William Johns has endeavored without success to secure the consent of the directors of the Uncle Sam to sink from 200 to 500 feet upon the ledge. He still has faith in the mine, but the directors do not seem to be inclined to expend any money in the further exploration of the property which yielded them millions of dollars.

Sierra.

Enterprise: The old Hawkeye mine, of Howard Flat, owned by Chas. Overstreet and Thos. Todd, is paying well.

Siskiyou.

Yreka *Journal*: The old Madam Clark diggings, long since abandoned, has been reopened by Walker & Falkensteir. They have rigged up the mine with pipe and a giant.

Chamberlain & Timmons started their new mill October 4th. They have about 200 tons of quartz on the dump, which is expected to yield over $20 per ton.

At the Gum Boot mine, owned by Simon Bros. and Schuler, they now have a ledge 10 inches wide and it is gradually widening as they go down.

At the Garrett & Co. mine, at Hamburg Bar, they are working night and day with a force of twenty-five men.

The Columbia mill is crushing quartz from their mine every day.

The Bennett mine, which is located back of Scott Bar, is paying handsomely again.

At the Maplesden Bros. claim, near Hamburg Bar, they are working a large force of men night and day, but as yet have not gotten to bedrock. This mine has always yielded splendidly and no doubt it will do the same this year.

The Grider mine at Seiad has proved a bonanza to its owners this year.

The new mining company at Nolton, on Thompson creek, which recently purchased the old Shiner mine, have a force of fifty-five men at work on their ditch.

The Seattle Placer Mining Company, of Thompson creek, are busy rigging up, to be ready for the fall rains, when work will be commenced and continued all winter.

The Classic Hill mine, owned by Matthews & Vogan, is being rigged so as to be worked on a more extensive scale.

The quartz mine owned by A. Erno, in Quartz valley, to where the 5-stamp mill was removed a few weeks ago, is doing well. The ore which it is producing is rich.

Reporter: It is reported that work on the old Quartz Hill mine will soon be resumed under new management. M. F. Campbell of San Francisco has been negotiating a sale of this property to a New York company, and he will have some development work done while the sale is pending.

Journal: The big French creek ledge has been closed down for some time, as the result was discouraging.

L. A. Moxley, J. Custer and S. Fitzsimmons have discovered a rich ledge in Quartz valley. It is from 6 to 10 inches in width, with free gold.

Trinity.

Journal: Since the litigation for the ownership of the Altoona has ceased the place has been built up from the decay into which it was falling and presents a prosperous appearance. There are about 125 names on the roll of the boarding house at this time, which does not include the men engaged in chopping and hauling. The shaft at the hoisting works is now down 370 feet and men are working night and day.

At the Integral there are twenty men employed. The owners are running a long tunnel in the hope of striking the lode at a good depth. Meantime the hoisting works and furnaces are idle.

Tuolumne.

Independent: The Jumper mine, with its 20-stamp mill, is still showing up magnificently. Recently a chunk of pure gold as big as a man's hand was taken out, and the output this month will be near $200,000.

The Excelsior and Mt. Vernon mines, in the Sugar Pine district, have been bonded to Mr. Epsensperger for his Salt Lake and Denver associates.

The contract let some time since for a crosscut tunnel in the Arbona mine by the Equitable Mining & Milling Company has been completed and has revealed on the hanging wall side a body of exceptionally good ore more than 3 feet wide in addition to a much larger quantity of low-grade rock.

Union-Democrat: The Belleview mine has been shut down for two weeks to place in position boilers for additional power and a large new pump. Just as soon as the new machinery is set up stoping will be commenced and the mill start crushing. The company have levied an assessment of 25 cents per share, and have, during the past twelve months, made a clear profit of $3000 per month, but owing to two estates that own three-fourths of the stock of the corporation being in the Probate Court, all moneys derived from the operation of the mine must be paid into Court and cannot be used for improvements.

On the Whiskey Hill a double-compartment shaft is being sunk. About fourteen men are working now and more will be added as fast as possible. The intention of the operators, as given out, is to go 1000 feet deep before putting up a mill. The power to operate the hoisting machinery will be brought from the company's power plant at the Santa Ysabel group. The men who paid $150,000 for the Whiskey Hill group will push development work on the property.

At the Arbona the crosscut tunnel has cut the ledge and they are now drifting on it. Last Saturday Superintendent Allen stated he had struck an exceptionally rich chute of ore, the best so far found. There are only a dozen men working at present, but more will be put on in a short time.

The boilers for the new 5-stamp mill to be built on the Marconi mine at Groveland were shipped up a few days ago.

The upraise on the Alameda is nearly timbered. This coming week an incline shaft will be started. It will be a continuance of the upraise and will be sent down 400 feet below the tunnel level this winter.

The Mammoth continues to work about the same number of men on the shaft that is be-

ing sunk at the end of the main working tunnel. They are making good progress and will soon be down 600 feet.

The Bella Union, which was under bond to Rosenfeld and Hulsey, has been shut down.

The owners of the Hull mine, near Tuttletown, are building a 6-stamp mill on the property. It was worked formerly and then abandoned.

The outlook at the Groveland property is so encouraging that the talk of building a 10-stamp mill this fall is being again revived.

John Whitney has suspended operations on the Punter for the present.

N. W. Moody of the Mt. Zion Company is about ready to start the mill on the Kanaka mine. His company has a bond on it from L. Cassarretto.

F. Sutton, owner of the Street and Gross mine at Tuttletown, upon which there is a 6-stamp mill, is going to commence work on it immediately. It has a good record as a former producer and is expected to pay handsomely now.

The Goodwin Mining Company are going to start work on the Pennsylvania and Rhode Island claims.

NEVADA.

At the annual meeting of the Con. Cal.-Virginia Mining Company last Monday in San Francisco, the following board of directors was unanimously elected: C. H. Fish, N. T. Messer, H. Zadig, T. F. Fish, and Charles Hirshfield, vice John T. Twiggs, resigned. A revised edition of the by-laws was then adopted, in conformity with recent legal decisions in regard to transfer of stock pending an assessment.

The report of Superintendent Lyman for the year shows there have been extracted from 1600, 1650 and 1750 levels of the mine in the twelve months ended September 30, 1896, 7059¼ tons of ore, providing bullion valued at $211,333.49, showing an average yield of $29.93 per ton. This bullion carried $108,306.45 in gold and $103,027.04 in silver. The coin value of this bullion amounted to $160,686.72. Speaking of the fire which caused more or less trouble in the latter part of last year, Mr. Lyman says that his efforts to extinguish the flames have been successful, and no trouble has been experienced from gas since June and July. The origin of the fire is not known, but the superintendent ascribes it to ground pressure continually crushing and splintering the stope timbers, creating an intense heat, which caused the dry timbers to ignite. The two shafts continue to be in good working condition. The water has risen 10½ feet in the C. & C. shaft during the past year, and is now up to a point 9½ feet below the shaft station floor of 1750 level. The Sutro tunnel connection with the Con. Virginia shaft is 10½ feet above the 1750 level sill floor. The board of directors reorganized after the adjournment of the stockholders' meeting as follows: C. H. Fish, president; N. T. Messer, vice president; A. W. Havens, secretary, and D. B. Lyman, superintendent.

The promoters of the Gold creek mines, Maj. J. L. Robertson and son of New York, H. J. Mayham and W. B. Duval of Denver, have returned from another trip of inspection near Elko. They have decided to inaugurate extensive development work at once. They have contracted for a large reservoir and dam. The reservoir will have a capacity when finished of 3,000,000 gallons of water. This will put the property in shape for the immediate production of gold as soon as the weather permits in the spring.

Pioche *Record*: In his claim south of the Deer Lodge camp, on the Nevada side of the line, J. Delmue is reported to have cut in his tunnel a 4-foot vein of high grade silver-bearing ore.

De Lamar *Lode*: It was reported on the streets during the week that the De Lamar property is being placed on the London and Paris markets. The system under which the stock is to be floated is known as the Barnato system, named after a Transvaal mining operator, and in this manner all of the stock will be worked off privately.

Reno *Gazette*: H. Miller has come in from Pyramid with two tons of ore from his mine. He expects to get good returns from it and thinks he has a very rich mine. He is down on the ledge about 10 feet and now has a ledge 2 feet wide in the bottom of his shaft, and it is growing wider every foot he sinks.

J. Raser is in from Grant creek with a sample of colmanite or borax in the form of a ledge. He found it about forty miles east of Grant creek and the ledge is about 2 feet wide.

Winnemucca *Silver State*: Two promising gold prospects have recently been discovered in the northern part of this county. One of them is situated on Big Wilder creek in Denio district. A 2-foot vein of rich free milling ore has been uncovered. L. L. Rickard and a prospector named Ward recently struck a gold ledge near Disaster Park which is the best prospect yet found in the district.

OREGON.

Baker City *Bedrock Democrat*: At the White Swan the owners are elated over the recent strike on the 400-foot level. A force of miners will be set to work at once drifting on the ledge both east and west, and another force will continue sinking until a depth of 500 feet is attained.

Democratic Times: Crow & Co. of Lost Flat, Josephine county, are taking out considerable rich ore, which it is estimated will yield $100 to the ton.

Twenty-seven tons of ore from the Oregon Bonanza mine, in Williams Creek district, crushed last week, yielded 215 ounces of gold, valued at $3000.

Capitalists and miners have been quite numerous in Grant's Pass lately, and the outlook is good for a season of exceptional activity in mining circles.

The Eccentric Mining Company, of Williams Creek district, last week had fifteen tons of ore milled, which yielded 39.36 ounces of gold, valued at $13.50 per ounce.

Several men are steadily employed at Beekman & Huffer's mine, near Jacksonville, and considerable good ore is being taken out.

Democratic News: The Mattern mine, in Ashland district, is being steadily developed, with flattering prospects.

A contract has been let for sinking a shaft on the west side of the Ashland mine.

The owners of the Black Republican mine, near Dodson's butte, Douglas county, have struck a large vein of ore, which is said to assay well in copper and gold.

F. Mattison and W. T. Nelson of Idaho have purchased a group of placer mines containing 100 acres in Kerbyville district.

BRITISH COLUMBIA.

Mail Creek *News*: Portland capitalists have purchased the Portland Oregonian, Exchequer and Multnomah mineral claims on Bear creek, and have incorporated them for $500,000.

Rossland *Miner*: The work of the past week on the Josie shows steady improvement in two places where development is being done. The drift from the main shaft has now broken squarely into the ore chute from which the principal shipments were made from the main tunnel. The drift has now a full face of solid ore.

The Montreal and British Columbia Prospecting and Promoting Company has taken up the bond on Gold Drop, in Greenwood camp. As soon as matters can be arranged a systematic development of the property will be commenced.

A strike is reported from Downie creek, forty miles from Revelstoke, of a ledge of iron oxide and galena. The ore assays in gold, silver and lead.

A Vancouver syndicate, represented by J. H. Hoar, has bonded the Ole Bull, Roseberry and C O D for $35,000, and is now working these claims. The same syndicate has secured a number of other properties on Barrett creek.

In Okanogan district the Anglo-American Mining & Milling Company of Rossland has taken a six months' bond on the Rainbow group of mines on Palmer mountain. The group consists of the Rainbow, Coyote and one or two others. A mill will be built at once, and the development will go on all winter. The ore is free-milling gold.

A Pittsburg, Pa., company has a bond on one of the iron cap properties near Loomiston, and will expend $10,000 or $15,000 in its development.

Spokesman-Review: F. P. Buck and others of Sherbrooke, P. Q., have purchased the Knob Hill mineral claim in the Greenwood camp, of the Boundary creek district. The consideration, it is understood, was $30,000. The claim is crown granted and adjoins the Old Ironsides.

Letters received from Rossland state that the bottom of the shaft of the Deer Park is in solid ore.

August Heinze has purchased an alternating dynamo capable of furnishing 100 lights of 16-candle power each, and an arc machine that will supply twenty-five lights. These arc lights will be used at the smelter to the number of eight or ten, and at the docks the railroad will have the use of three or four, while the remainder will be for the use of the city of Trail.

UTAH.

Salt Lake *Tribune*: A new strike of rich ore is reported in the Mercury.

The Old Fred, near the Sunshine, now lying idle, is to be worked again. There are bodies of low-grade ore developed.

W. G. Adamson and partners will resume the development of the Pacific group.

The Geyser in the next thirty days will be putting through 100 tons daily at its plant. There is a belief that it will begin the payment of dividends in December.

That the ore zone of the Tintic mines is as well defined at Silver City as at other points in the district is revealed in workings on the Shoebridge bonanza, where rich ore has been uncovered. The seam is not a big one, but it is rich and carries ore identical with that which was found in the Centennial-Eureka, the Mammoth and others.

From the Blue Bird, which is in the same diggings, comes a report that an ore body has been encountered at a depth of 225 feet, where there is found a high-grade silver-bearing rock that also shows some copper.

The Homestake has also discovered an ore body. Ore is now being hoisted for shipment.

At Tintic another new strike of high-grade ore is reported in the Sunbeam on the 250-foot level.

The Autumnal, at Park City, has begun shipping ore.

A conveyance from the Societe Anonyme des Mines de Lexington to the Conglomerate Mining Company, covering fifty acres of mining ground in West Jordan, has been placed on file. The consideration is 200,000 shares of stock of the Conglomerate Company. The conveyance also includes the Montana, third westerly extension of the Telegraph, No You Don't, Roman Empire, Nez Perces Chief, Mineral Zone and Key Note No. 2, together with an undivided half interest in a canal from the Jordan river.

Bingham *Bulletin*: Manager Wier of the new Henry M. outfit is in consultation with the owner, Mr. Newhouse, at Denver, and it is expected that plans will be adopted for the beginning of extensive operations in the near future.

The strike in the 300 level of the Winnamuck is reported to be opening up well.

IDAHO.

Avalanche: At the Trade Dollar the production continues steady. Over 125 men are upon the payroll.

At the Pauper connections have been made with the old shaft. Something like 200 feet of backs are now available.

At the Boonville the new mill is now almost complete.

Spokesman-Review: Every great mineral-bearing ledge in the Cœur d'Alenes has been traced and located for many miles in either direction from the places where mines have been opened up, with the single exception of the one on which the Bunker Hill and Sullivan is located. For years prospectors have hunted for that in the country between Wallace and the St. Joe river, some of them spending considerable money in their search. So many have hunted for it, and so extensive have been some of the endeavors, that it is estimated that no less than $50,000 in time and money has been vainly spent in trying to find where it crosses through the St. Joe mountains. It is claimed that S. D. Cole has made the discovery in a rich ledge on Slate creek.

Some rich placer ground has been discovered along one of the small tributary streams of the Clearwater, about fifteen miles from Kendrick. The gulch through which the stream runs has escaped the notice of prospectors.

Miners are leaving Kendrick every day for the Pierce camp to work on the numerous quartz claims that are being developed.

MONTANA.

Inter-Mountain: A 5-foot body of copper ore has been struck at the Iduna mine, in the Ground Squirrel district, upon which work was recently resumed.

The placer mines on Gold creek have all done well during the past summer, notwithstanding an unusually small supply of water.

The Lookout Mountain Company is doing extensive work on the mountain of that name. This company has thirteen locations.

The Gagnon is now producing about 350 tons of copper per day. The adjoining property, the Original, is producing about 50 tons. At the Original a new shaft house is being constructed and other improvements being made. When completed the electric line will be continued to the Original.

At the Keystone mine, in the Yakh district, a railroad has been constructed from Troy to the mine, a 10-stamp mill is now being erected and arrangements have been made to put in ten additional stamps at an early date.

At the Golden Scepter mill the machinery is all in place and, with the electric apparatus in operation, will be put in motion not later than Nov. 20. There is enough ore mined and in sight now to keep the mill in operation for eight months. The plant as it stands represents an outlay of about $750,000.

The news comes from Philipsburg that the Bimetallic properties at Granite will start up Nov. 5.

The great ore bodies of the Diamond Hill mine will be opened by tunnels at a depth of 500 feet and 3000 feet in length. The vein or zone is from 100 to 200 feet in width. The main or lower tunnel, which is directly behind the new plant, is being driven in on the vein and near the center of the ore body. Galleries will be run at every 200 feet, where ore chutes and stopes will be opened, from which the ore above will be drawn into cars and delivered direct to the ore bins in the mill.

SOUTH DAKOTA.

Black Hills *Times*: Supt. J. S. Grable, of the Union Hill Mining Company, has returned from New York, where he attended a meeting of the company's directors, at which the matter of erecting a stamp mill of large capacity was discussed and practically decided in favor of its erection on the Union Hill group of mines. The smelter and 10-stamp mill in Galena camp are running steadily on ores from the company's properties with satisfactory and profitable results.

The McKibbon tunnel, on Yellow creek, is now in 170 feet and has encountered the wall of the vertical ledge. It is estimated that in five or six feet more the ore will be struck.

The Gold Hill Development & Mining Company have commenced work on their group of claims situated in Garden City camp.

Development work on the old Silver Ridge group of claims situated east of the Ragged Top has been resumed by the owners, A. J. Smith and associates.

The National Mining Company have decided to resume work on their property situated on Sugar Loaf hill, southeast of the Ruby Bell. The shaft, now 203 feet deep, will be carried down to the ore contact, estimated to be 50 or 60 feet deeper.

A depth of 250 feet has been reached in the Snowstorm shaft on the Hawgood property. The bottom of the shaft is now in a soft mud shale, which indicates the close proximity of the ore contact.

The stamp mill of the Hawkeye Mill & Mining Company, at Pluma, has been started up again and will be kept in continuous operation day and night on ores from the company's mines.

The owners of the Kicking Horse group of claims, situated on the Blacktail divide, have encountered a fine shoot of ore in the west drift from the bottom of their 165-foot shaft. The shoot is four feet thick, and extends beyond both sides of the drift.

COLORADO.

Denver *Republican*: The Gold Coin strike has been the incentive for much active work in the Victor townsite. The discovery of a pay vein in the granite, unassociated with an eruptive dike, has been a great gain to this end of the district in giving mining men a new formation to exploit. A number of veins similar to, and running parallel with, the Gold Coin are known to course the camp site, and these are now coming into prominence. The Gold Coin shipped 20 carloads last week and is getting out from three to four cars a day. In the new working on the north ore chute, at 40 feet north from the 80-foot prospecting shaft, the ore is showing 42 inches wide and is not of the average quality.

Stoping has begun in the rich ore chute of the Bonanza King opened in the 300-foot drift from the Midget shaft. The chute has been developed for 100 feet in length, and carries a wide body of high-grade ore for the full distance.

The money has arrived from Baltimore to guarantee the success of the Cripple Creek and Gold Hill tunnel, negotiations for which have been under way for several months. Machinery ordered in advance will be put on at once and work pushed. The tunnel starts below the track of the Midland Terminal railroad on Gold Hill, and runs toward the Anchoria-Leland, which it cuts at 600 feet depth, in about 3000 feet length.

The Ross-Hurd tunnel into Gibbon hill has reached a length of 440 feet and is being driven steadily with air drills.

Production from the Tutt and Penrose lease on the Abe Lincoln in Poverty gulch for the past month was 200 tons, the ore averaging $75, and being shipped without sorting.

The Elkton is now shipping twelve cars a week of its several grades, ranging from $200 smelting to about $30 milling ore, and is holding the production at $40,000 a month. Arrangements are under way for putting in new pumps, which will allow sinking to be resumed and the level started at 400 feet to be run into the ore.

The New York syndicate, represented in camp by E. H. De Vore, has secured an extension for two months on its bond on the Katinka on Guyot hill, for which they are to pay J. S. Jones and others $46,500 when the option is taken up.

At Aspen nearly 100 miners have been laid off within the last few days. There are two causes. One is the low price of lead and silver and the other that a low grade of ore is being encountered in some of the properties, which, with the price of silver at anywhere near its proper figure, would yield handsome returns.

The story of gold having been discovered in the Independence Pass section last summer is now confirmed. Nothing will be done on the properties before next season.

Word comes from Chicago to Alma conveying the authentic information that the Troy Mining Company, owning the group of Mosquito district mines, comprising the Union, Brown, Orphan Boy Extension, Emma C., Little Nell, Alice, Union Placer claims, has sold a controlling interest to Chicago capitalists for $100,000.

In San Juan county the ore shipments from Silverton station average from twelve to fifteen cars daily, many of the cars carrying twenty tons.

E. C. Kelly has returned from Denver with the money necessary to run the first 500 feet of his tunnel and work is to commence at once.

The North Star is shipping eighty tons of ore per day, requiring the services of a team of 300 pack mules.

At Central City in the Corydon mine on Academy hill the east and west 700 levels are being extended with a 2½ and a 5 foot crevice in each. Daily shipments of ore taken from each of these levels average from twenty to twenty-five tons.

The shaft at the Gettysburg mine in Russell district is now down 400 feet, and stations are being cut, preparatory to commencing levels. There is about 6½ feet of crevice matter in the bottom of the shaft and shipments have been already made to the mills.

During September there were shipped from the Black Hawk depot 302 cars of mineral, representing the smelting ore and tailings shipped to smelters and elsewhere for the entire month. This is an increase of 102 cars or 1,656 tons over the shipments for the corresponding month of last year, also an increase of ninety cars over the previous month of August this year.

ARIZONA.

Journal-Miner: Another dividend of ten per cent has been declared by the receiver of the Little Jessie mine. This property is paying a large profit now, and new ore bodies are said to have been opened up recently.

The mining future of Jerome has a very bright look at present to those who take an interest in it. During the past four weeks three of the best companies in America have taken bonds on properties here, all of which call for development work to commence within sixty days.

The Lottie mine, on Big Bug, is developed to a depth of 500 feet and there is about 3 feet of ore at its deepest workings. The mill continues to run steadily.

Silver Belt: At the Black Copper group of claims development work has been temporarily suspended, to permit of the underground works being timbered. The mine has been sufficiently exploited to demonstrate its value. A one-fourth interest in the mines was recently sold to New York parties, who are refiners and dealers in copper, and Dr. J. M. Ford and Jas. A. Fleming of Phœnix, who bonded the property, are now in New York negotiating for the transfer of the other three-fourths to the same parties. Hoisting works will be purchased immediately, and shipped from the East, and the work of development will be vigorously pushed, and reduction works erected at an early date.

Prescott *Courier*: Word comes from Hassayampa district that a large body of ore has been struck in the Addie mine, which has been worked for several months past by Prof. Comstock, under bond. The ore carries copper gold and silver. About 700 feet of development work has already been done, mostly tunnel.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING OCTOBER 13, 1896.

569,397.—COOKING STOVE—J. E. Armstrong, Santa Cruz, Cal.
569,272.—ORE CRUSHER—S. M. Briggs, S. F.
569,378.—WELL CASING SPEAR—E. M. Hoagland, Oakland, Cal.
569,458.—WINDMILL GEAR—W. C. Heffner, Prospect Park, Cal.
569,460.—CARBURETER—C. W. Ingraham, Heppner, Or.
569,284.—PRUNING TOOL—R. Jacks, Quincy, Cal.
569,207.—BOILER FURNACE—E. W. Jones, Portland, Or.
569,346.—CRANK HANDLE—J. D. McFarland, Jr., Prosper, Or.
569,509.—MUSIC CHART—F. Mueller, Spokane, Wash.
569,238.—WIRE ROPE CLIP—A. Painter, S. F.
569,303.—REAMER—J. Singer, Los Angeles, Cal.
569,361.—ORE FURNACE—C. E. Stockford, Sulphur Creek, Cal.
569,437.—HAY FORKS—J. F. Tuttle, Springdale, Or.
569,311.—CAR BRAKE—R. G. Woodward, Alameda, Cal.
569,312.—CAR BRAKE—R. G. Woodward, Alameda, Cal.
26,171.—DESIGN FOR BADGE—Whiting & Cather, Lebanon, Or.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

COOKING STOVE.—John E. Armstrong, Santa Cruz, Cal. No. 569,397. Dated October 13, 1896. The general object of this invention is to improve the cooking stove by improving the application of the heat to the oven and by providing for the equal application of the heat of the oven to the materials therein. The application of the heat to the oven is obtained by a peculiar construction of the firebox and the oven, the front wall of the latter forming the back of the former, and said wall having upon its firebox side a series of parallel projecting ribs or flanges forming passages which communicate with a passage below the oven, said passage passing under the oven and thence to the stovepipe. There is an ashpan under the firebox having a wall or partition which forms the front of the passage under the oven where said passage communicates with the spaces between the flanges or ribs. The equal application of the heat of the oven to the materials is obtained by the combination of a rotable plate within the oven, said plate being rotated automatically by means of a fanwheel in the stovepipe operated, as desired, by the escaping products of combustion. The materials to be cooked are placed upon this rotating plate and are thus subjected to an equal heat.

WELL-CASING SPEAR.—Ellery M. Hoagland, East Oakland, Cal. No. 569,378. Dated October 13, 1896. This invention belongs to the general class of well-boring tools, and especially the casing spears. The object of these spears is to take hold of and withdraw the casing. They consist of a stock which is let down within the casing by a suspending device, said stock being provided with gripping wedges or slips which by a wedging action when the stock is pulled up, engage or grip the interior of the surface of the casing and hold tighter the harder they are pulled upon so that the casing may be withdrawn. The object of the present invention is to provide a casing spear, the wedges of which may be readily initially adjusted to suit any sized casing, and which may be as easily released when it is necessary to take the spear out. This spear consists of a stock with inclined plane seats and slidable wedges or slips mounted thereon having elongated slots, a means tending to hold and force the wedges or slips upwardly, slidable locking pins engaging said wedges or slips and on which the latter have an independent vertical movement and devices in the stock for engaging the locking pins to hold and to release them.

CAR BRAKES.—R. G. Woodward, Alameda, Cal. Nos. 569,311 and 569,312. Dated October 13, 1896. This invention relates to improvements in car brakes which are especially adapted for use upon street railways and other cars of all descriptions. They consist essentially in the combination of brakes which are adapted to be applied to the wheels of the car, the shoe or shoes suspended above the rails, with suitable connections by which the shoe may be depressed and by frictional contact drawn backward in either direction, so that by this movement the shoe will act to apply the brakes to all the wheels. The vertically movable shoe is suspended above the track between the wheels of the car or truck, and a rocking shaft journaled across the truck frame is so connected with the shoe that the latter is depressed into contact with the track by the rocking of the bar; connections between the shoe and the brake beams act to move the latter and force the brakes against the wheels when the track brake is in operation.

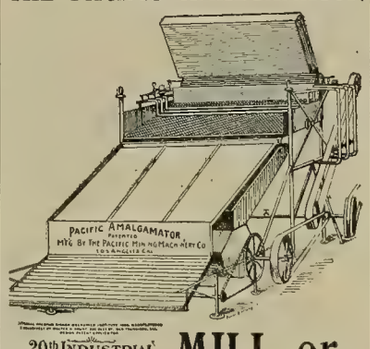
ORE ROASTING FURNACE.—Charles E. Stockford, Sulphur Creek, Cal. No. 569,361. Dated October 13, 1896. This invention relates to a furnace for roasting ores, and is particularly designed for roasting quicksilver and similar ores. It consists of a shell or casing having central ore passages which are oppositely inclined and have vertically connecting throats between the bottom of each floor, and the upper end of the succeeding one, fireplaces in the casing, one upon each side of the ore passage having arches or openings leading inward, a passage or flue back of and beneath each floor, following the inclination thereof and of its vertical throat having a channel opening into the ore passage at the top of one floor and just above the lower end of the floor next above so that the heat acts directly on the ore passing alternately on to one floor and then over the ore and floor above. In conjunction with this is a means for charging the furnace, and a means for conveying away the hot air and fumes both from above and below the ore.

Commercial Paragraphs.

THE Risdon Iron Works have issued the tenth edition of their catalogue (No. 8) on the Bryan roller quartz mill. The Bryan mills have been in use on this coast for ten years and have gone far to show that old principles of milling are hard to excel. The new catalogue is an attractively arranged volume of fifty pages containing illustrations and data of considerable value.

THE Detroit Copper Company recently bought from the E. R. Allis Company at Denver, Col., one of the largest sized copper furnaces—42x60 inches—which is to be erected upon the company's property at Morenci, Ariz. This is the fourth large furnace that has been erected on the Detroit company's property. William Church of Denver is president of the company.

THE PACIFIC AMALGAMATOR



MILL or PLACER.

A Guarantee with Each Machine.

This machine is the finest gold saver for both placer mines and quartz mills. No other plate necessary in mills where the Pacific Amalgamator is used. It is constructed almost entirely of metal; it can be transported on pack train. Possesses a large amount of silvered amalgamating plate surface. No scouring of amalgam. Any ordinary amalgamator can operate the machine with good success. Send for catalogue.

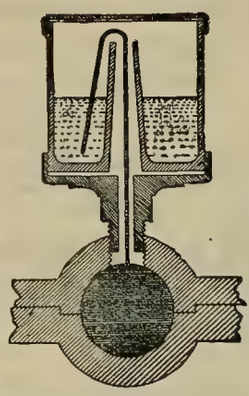
Positively Reduces Oil Bills 75 Per Cent.


THE FINCH OIL CUP.
Frictional vibration by the motion of the shaft against the point of the wire causes the oil to flow, and that this flow is not produced simply by syphonic or capillary action but by frictional vibration is proven by the fact that if the wire does not rest on the shaft then the oil will not flow. When the machinery stops the feed stops, therefore **the Finch Cup is Absolutely Automatic, Feeds Enough Oil and No More, Prevents All Waste, Needs Very Little Attention.**
Read One of the Many Testimonials:
UNION GAS ENGINE CO. SAN FRANCISCO, July 19, 1894.
During the past three years we have used your Cups for the crank shaft bearings of our engines, and also on all bearings of shaftings and tools in the shop. Our engines now *require no attention* except to fill the Cups occasionally, and therefore we can cheerfully recommend the Finch Cups to any one as *being the best in the market.*
K. J. McHUGH, 51 Fremont St., San Francisco, Cal.
General Agent for Pacific Coast. Send for Circular.

HORACE F. BROWN, CONSULTING ENGINEER.

Special attention given to preparing plans for the Chlorination and Bromine Processes of Treating Gold Ores.
PATENTEE { Brown's Complete Automatic Mill Process. Brown's System of Mechanically Stirred Roasting, Cooling and Conveying Furnaces, Etc.
1607-8 Manhattan Building, Chicago, Illinois.

KENDALL GOLD AND SILVER EXTRACTION CO.
THE KENDALL PROCESS is the most efficient method of using cyanide for the extraction of precious metals from their ores. Wherever this process has been adopted the result has been increased percentages of values recovered and saving of time. Material reduction in consumption of chemical has also been demonstrated with respect to several classes of ores.
All ores, without exception, amenable to cyanide treatment can be treated to better advantage by the Kendall Process. This can be accepted as an axiom.
The Kendall system of gold and silver milling comprises (1) the Extraction Process, in which the chemical solution extracts the values from ores; (2) the Recovery Process, by which the gold and silver are obtained from the solution, and (3) a modified form of plant, not indispensable, but permitting the use of unskilled labor.
Owners of mines and reduction works can obtain full information on application to
KENDALL GOLD AND SILVER EXTRACTION CO.....47 Broadway, New York City.

The General Gold Extracting Co., Ltd.,
PELATAN-CLERICI PROCESS.
Patented in U. S. and Other Countries. Capital, £100,000.
London Head Office.....8 Drapers Gardens.
Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.
This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.
Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.
F. CLERICI, Manager for U. S.

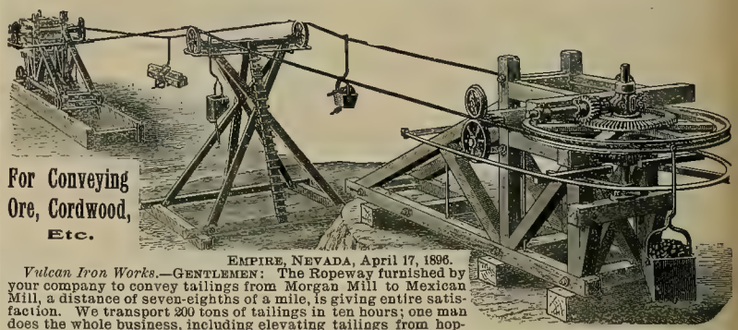
VULCAN ROPEWAY

— WITH —

AUTOMATIC ORE LOADER AND AUTOMATIC DUMPING DEVICE.



For Conveying Ore, Cordwood, Etc.

EMPIRE, NEVADA, April 17, 1896.

Vulcan Iron Works.—GENTLEMEN: The Ropeway furnished by your company to convey tailings from Morgan Mill to Mexican Mill, a distance of seven-eighths of a mile, is giving entire satisfaction. We transport 200 tons of tailings in ten hours; one man does the whole business, including elevating tailings from hopper in the ground, operating Vulcan self-loader, and attending to the Ropeway generally. The self dumper requires no attention whatever. The Vulcan loader I consider the best feature in the whole Ropeway, making it possible for one man to load 200 tons in ten hours.

Yours very truly, J. P. WOODBURY, Supt.

Market Reports.

The Markets.

SAN FRANCISCO, Oct. 22, 1896.

Business is reported fairly active considering the exciting election. It is generally conceded that after the current month there will be a larger demand for goods than has ruled for many years. It is also the belief grounded on experience that the coming year will be exceptionally prosperous. This opinion is grounded on the fact that all farm products are bringing good prices, particularly grain, and when this occurs the purchasing power of the masses is increased. Besides this the hoarded gold will come out for investment the same as it did in 1880, which made that year unusually prosperous. The advance in our exportable products will swell the export values and enlarge, still more, the balance of trade in this country's favor which will draw increased quantities of gold to us. The Agricultural Department furnishes the following: "The value of our agricultural exports in 1892 was $799,328,000 and the value of exports of manufactures in that year was $158,510,000. The value of our agricultural exports in 1896 was $569,841,000 and the value of the exports of manufactures in that year was $228,480,000. Therefore, while the manufacturing exports increased $69,970,000 between 1892 and 1896, we lost $229,487,000 in agricultural exports." This current fiscal year will show a very large gain in the export value of farm products owing to the advance in market prices.

The local money market is practically unchanged. The withdrawal of gold from banks for hoarding is about over, leaving our banks in good financial condition. All legitimate wants from regular customers are freely met. It is quite generally conceded that after election several millions of dollars will come out for investment which will lower the rate of interest. In banking circles it is stated that a Swiss-Italian bank is to be established in this city. The Eastern money markets are again working easier with more gold coming from Europe. The call for funds to move crops has been exceptionally large, fully twice as much as had been estimated. In well-informed circles at the East it is stated that fully $200,000,000 in gold is being hoarded in this country. This will begin to come out for investment soon after election, which will make very active and prosperous times. The premium on gold was, at last advices, quite strong. In Europe the money markets are firm, with the rates of discount and premium on gold slightly higher, but notwithstanding this business is reported better than at this time in 1895.

New York Silver Prices.

NEW YORK, Oct. 22.—Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.
Friday	30 1-16	65⅛
Saturday	30 1-16	65⅛
Monday	30⅛	65⅛
Tuesday	30⅛	65¼
Wednesday	30⅛	65⅛
Thursday	30 1-16	65⅛

	Copper.	Lead.	Iron.	Tin.
Friday	10 75	2 75	10 25@12 00	12 90
Saturday	10 75	2 75	10 25@12 00	12 85
Monday	10 70	2 75	10 25@12 00	12 80
Tuesday	10 70	2 75	10 25@12 00	12 75
Wednesday	10 70	2 70	10 25@12 00	12 75

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	7@8
Commercial Loans, prime	6@8
Call Loans, gilt edged	6@7
Call Loans, mixed securities	7@8
Mortgages, prime, taxes paid by lender	6@8
New York Sight Draft	Par
New York Telegraphic Transfer	05½
London Bankers' 60 days	$4.82½
London Merchants	$4.81½
London Sight Bankers	$4.85
Refined Silver, per oz., 1000 fine	64⅜
Mexican Dollars	50⅛@51½

SILVER.—The market has strengthened slightly at the East under a limited demand, which is indicative of stocks being well concentrated. It is the opinion in well-informed circles that there is liable to start in quite a bull movement at home and abroad, which may advance prices quite rapidly, owing to there being a large short interest. The production in this country is said to be less than in 1895, but then the legitimate demand has fallen away to a large extent. The steamer Belgic for the Orient took out $31,700 in bullion for Hongkong and $125,782 for Hiogo.

MEXICAN DOLLARS.—The market seems to be steadying up, with a slightly better demand ruling. The steamer Belgic took out 218,386 dollars for Hongkong.

COPPER.—The market is steady. Eastern mail advices state that there is a good export movement and an improving home demand. James Lewis & Son, Liverpool, report as follows on copper in their circular of October 1st: "The market has lacked animation during the past month, though it has remained firm, with moderate fluctuations in the value of good merchantable copper, which closes 13s 9d higher for cash and 17s 6d for three months' prompt, the advance on the latter having widened 3s 9d with the increased dearness of money. For refined copper there has lately been more inquiry, and manufacturers have taken a considerable quantity of American electrolytic at the low prices at which it was offered—this being the cheapest quality of copper obtainable—resulting in an advance of 10s per ton during the last few days. Much less copper is now offered for sale from the United States than was the case some time ago."

The market is quoted as follows:

Ingot, jobbing	—@14
Ingot, wholesale	—@13
Sheet copper	—@16½

QUICKSILVER.—A good export and home demand is reported. The last steamer for Mexican ports took out 100 flasks.

The market is quoted as follows:

Domestic trade, per flask	36 50

For export, quotations are nominal but less than for home.

LEAD.—The markets at the East and on this coast are barely steady. Consumers do not appear to anticipate wants.

Our market is quoted as follows:

Pig	—	@	3 60
Bar	—	@	3 95
Sheet	—	@	5 25
Pipe	—	@	4 50

SHOT.—There is nothing new to report.

Drop, sizes smaller than B, per bag of 25 lbs	$1 20
Drop, B and larger sizes, " "	1 45
Buck, Balls and Chilled, do, " "	1 45

ANTIMONY.—The demand is fair, with the market steady at 7¾@8½c in a jobbing way. New York mail advices quote 7¼ for Cookson's, 6½c for Hallett's and 6⅝c for Japanese, from store.

BORAX.—The shipping demand is reported fairly active.

The market is quoted as follows:

Refined, in car lots	6⅛
Refined, in sacks	5⅞
Powdered, in car lots	5¼
Concentrated, "	5⅝

TIN.—For both pig and plate the demand is quiet. The market for the former is steadier owing to the better prices for silver.

Pig, per lb			13½
Plate, I C coke, heavy, per box	—	@	$4 05
" " " light, "	—	@	3 95

POWDER.—There is a continued free demand.

The market is quoted as follows:

Hercules, No. 1*, per pound	11½c
" No. 2, " "	8½c

IRON.—The market is quiet but firm. An increasing consumption is looked for. Eastern markets are reported as follows by *Iron Age*: There is more animation in trade. Confidence is growing and has been stimulated by the advance in grain. This is checking the export movement in the cruder forms of iron and steel on account of the advance in freight rates. It is reported that German steel makers, alarmed by the inroads of American sellers of steel, have agreed to make a heavy reduction on competitive business. Chicago reports a heavy volume of business in local coke iron. Reports from Louisville indicate a large demand at the stove factories. Demand for Southern iron has fallen off at Cincinnati and there begins to be a feeling that the advance was not wholly warranted. Sales at Birmingham have been about sufficient to absorb the daily output.

Our market is quoted as follows:

AMERICAN.

	To Arrive.	Spot.
Sloss	$21 00	$23 50
Thomas	22 00	23 50
Salisbury	30 00	33 00

ENGLISH.

Barrow	$21 00	$23 0
Gartsherrie	21 50	23 0
Bolt	½ & 5-16, 20c; ⅜ and larger, 17c	
Lake Superior Sheathing		20

COAL.—There is nothing new to report in spot or cargoes in various positions. The consumptive demand is fair, with no stocking up. We quote as follows:

SPOT FROM YARD—PER TON.

Wellington	$7 50	@	8 00
Greta	6 00	@	6 50
Nanaimo	6 50	@	7 00
Gilman	5 50	@	6 00
Seattle	5 00	@	5 50
Coos Bay	—	@	4 50
Cannel	—	@	8 00
Egg, hard	—	@	11 50

TO ARRIVE—CARGO LOTS.

Australian	5 50
Liverpool Steam	6 25
Scotch Splint	— —
Cardiff	6 25
Lehigh Lump	9 00
Cumberland	13 00
Egg, hard	10 00
West Hartley	6 50

COKE.—The market is quoted as follows:

Gas Companies'	—		—
English, to load	8 00	@	— —
" spot, in bulk	8 00	@	9 00
" in sacks	8 50	@	— —
Cumberland	— —	@	— —

LUMBER.—The export movement continues large—fully 150 per cent more than at this time in 1895.

Redwood, Fluming	17 00	@	— —
Pine	14 00	@	19 00
Spruce	26 00	@	31 00

NAILS.—The market is unchanged. The demand is good.

The market is quoted as follows:

Wire, carloads, basis per keg	$3 20
" jobbing, " "	3 30
Cut, carloads, " "	2 95
" jobbing, " "	3 05

Mining Share Market.

SAN FRANCISCO, Oct. 22, 1896.

In last week's review of the mining share market mention was made of a sudden jump in prices for shares in the middle mines under the lead of Savage, Hale & Norcross and Challar. Friday morning the bears, having recovered from their fright, commenced a strong raid, sending prices down to nearly as low figures as ruled before the jump. It seems that the upmove was based on information which proved not to be entirely reliable; but it evidently served a good purpose, for many short sellers were forced to fill at a loss. The decline in the Pacific Exchange was so rapid they did not get out a large line of shorts, while in the San Francisco Board the market opened at very near the lowest prices of the day. Saturday, Monday and Tuesday the market was quiet and generally easy, but at the close of Tuesday a firmer tone developed which was more pronounced yesterday morning, with Con. Virginia showing the most strength, yet trading was light. In the afternoon the market was fairly steady, but still dull. The strength of Con. Virginia is said to be due to a continued improvement in the formation encountered in the work on the 1000-foot level near the Ophir line. Savage and Gould & Curry have shown some strength the past week on reports that the work on the Brunswick lode is of a more favorable character. There are miners who expect an ore strike in one, if not both, before long. The material encountered in the north drift on the Hale & Norcross 400-foot level has been quite favorable for a week or two past, but it may take some crosscutting before it can be determined as to ore. In Gould & Curry considerable work is being done. After all, nothing of more value may be found than has been discovered elsewhere, and, if so, end in disappointment to shareholders who look for big prices. So far as surface indications go, the writer does not feel warranted in saying that there are large moneyed men in the market ready for a good-sized deal, and until they come in it cannot be expected to go to high figures. Moneyed men will only come in when there is a genuine large ore development, for the days of big gambling on prospects, small strikes, etc., have gone by, for the moneyed public will not come in at high prices to help the game along except on dividend propositions, and these are not in evidence now but assessments are. While saying this it must be conceded that two or more small pools can at almost any time combine and promote a small upmove on reported strikes, and it is quite probable they will soon.

The news from the Comstock mines, which is essentially unchanged since last weeks' advices, reports active work in several with indications more favorable. At the north end the work in Utah is not of such a character as to attract attention. In both Union and Sierra Nevada it looks very much as if the aim is to do as much work as possible for the money expended without striking ore or anything else calculated to inspire confidence in outside operators. In Mexican the west crossdrift has entered better formation and it looks as if something more than assessments, if so desired, can be struck. Experienced miners are quite hopeful of good results, but for several years experienced miners, opinions have not "filled" only shorts have been compelled to do so after which then the usual low prices and bad reports. This does not apply to that mine alone for there are several to which the remarks are applicable. In Ophir they are still fooling in and around the central tunnel and also extending the west crossdrift on the 1000-foot level. How long it will take to get to the west lode seems, as yet, a conundrum. Perhaps this level when the work gets to be interesting and important may be abandoned until a more opportune time, as the 1450-foot level has been. In Con. Virginia, on the 1000-foot level, 50 feet south of the Ophir line, the formation and material encountered are said to be steadily improving. On the 1650-foot level another east crossdrift is being run. Ore continues to be raised from the 1750-foot level. The mill is running on ore. The joint Best & Belcher and Gould & Curry east crossdrift from the Bonner shaft is being pushed slowly ahead. In Savage active work is under way and, it is said, a good showing could be made if desired. In Hale & Norcross the work is essentially unchanged. In Challar a slight improvement is reported, but not of sufficient movement to attract attention. A few tons of ore is raised by Potosi as work in that mine is prosecuted. In Bullion and Alpha nothing new is reported. It seems as if they are as far off as ever from striking the ore found four or five years ago on an upper level. In Con. Imperial, Challenge and Confidence there is nothing new reported in official letters. From Yellow Jacket nothing is allowed to be made public. Some think the work in the mine is quite important. Belcher is raising ore sufficient to pay running expenses. The work in Crown Point is on several levels. It ought to attract attention before long. Instead of milling the ore taken out of Seg. Belcher the directors levied an assessment. From Overman and Alta there is nothing new to report in the official letters, not even the ore said to have been found in one of them some time ago.

On the Brunswick lode work is actively pushed in Gould & Curry, Savage, Hale & Norcross, Challar and Occidental. In none of these has anything been found which would attract attention if found on the Comstock lode, but it is the uncertainties and possibilities that make any mining proposition, and therefore the Brunswick lode mines are a decided gamble until more work has been done in them. Mining men of good judgment are quite hopeful that something of importance will be discovered yet. In Occidental work is continued on several levels. The advices are practically unchanged. In Challar they are at work on three levels—having taken up the Hale & Norcross 400-foot level south drift. If this drift is run to strike the downward continuation of the ore found above, more activity is looked for. A crossdrift is to be, or has been, started by Hale & Norcross on the 400-foot level. It is to be run for the downward continuation of the ore found above. The winze is still being sunk and when it reaches the 500-foot level work will be commenced to develop that level. In Savage and Gould & Curry the work is said to grow in interest. The shaft being sunk by Best & Belcher and Con. Virginia ought to be deep enough to open two levels in these mines.

From the Bodie mines, and also the Silver King, nothing of importance came to hand the past week. In Mono the Fortuna vein ore ought to be struck soon.

The following illustrates the changes of the week:

Mines.	Oct. 15.	Oct. 22.
Alpha	$ 13	$ 15

Frank H. Pettingell of Colorado Springs in his weekly letter says: "Regardless of numerous apologetic effusions to the contrary, the entire mining stock market is suffering intensely from many unforeseen influences of an exceedingly depressing character. This occasional passing of dividends has a very bad effect on everything relating to mining stock speculations. Of course, any one can say now they began to pay before the properties warranted it, which most companies ordinarily do. It would seem that money in the treasury of

Orders executed in large or small amounts for cash or on *reasonable* margins. Out-of-town orders by mail, telephone or telegraph will receive prompt attention. Daily market circular mailed free on application.

a mining company was like a redhot coal, and that the ordinary board of directors are always devising some plan whereby they can get rid of it. It is better to disburse it in dividends than to dissipate it in handsome salaries for services never rendered, as some mining companies have frequently done. It is true, I have in mind the Isabella Company, one of the most flattering mining propositions in the entire Cripple Creek district, possibly somewhat highly capitalized; but still, taken as a whole, the possibilities of the Isabella Company are beyond comprehension.

"Taking things altogether, the market has the appearance of remaining stationary for several weeks to come. There may be occasionally an exception to this prediction, but there are few evidences of anything that will help matters. High-priced stocks seem to share as much in the general decline as the cheaper ones, and the close corporations not generally offered on the market are those which are showing the greatest intrinsic improvement. It is not a selling period, and those who will gradually study the situation and be guided by the physical condition of the property will make no mistake, but will make nice profits. There is too much of inclination to be swept along by some fictitious report emanating from an unscrupulous source, or to be carried away in some exciting manipulation which only suggests that something good has happened, when invariably nothing has occurred except in the imaginary mind of some stock exchange enthusiast."

THE OVERLAND LIMITED, VIA UNION PACIFIC.

Only 3 1-2 Days to Chicago-----3 1-2.
Only 4 1-2 Days to New York---4 1-2.

The Union Pacific is the only line running Pullman double Drawing-Room sleepers and Dining Cars San Francisco to Chicago daily without change. Only one change to New York; dining car service entire distance. Vestibuled composite buffet smoking and library cars between Odgen and Chicago.

The only line running upholstered Pullman Tourist sleepers San Francisco to Chicago daily without change, and personally conducted excursions to St. Paul and Chicago without change, leaving San Francisco every Friday.

Tickets and sleeping-car reservations at No. 1 Montgomery St. Steamship tickets on sale to and from all points in Europe. D. W. HITCHCOCK, General Agent, San Francisco.

DELINQUENT SALE NOTICE.

GOLD BAR CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, near La Porte, Plumas county, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 4) levied on the Thirteenth (13th) day of July, 1896, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Cert.	No. Shares.	Amt.
E. C. Cain	170	2,500	50 00
E. C. Cain	171	2,500	50 00
C. L. Dingley, Jr	72	800	16 00

And in accordance with law, and an order from the Board of Directors, made on the 13th day of July, 1896, so many shares of each parcel of such stock as may be necessary will be sold at public auction at the office of the Company, Room 38, Crocker Building, San Francisco, California, on MONDAY, the 21st day of September, 1896, at the hour of 2 o'clock P. M. of said day, to pay said Delinquent Assessment thereon, together with costs of advertising and expenses of sale.

E. C. GODFREY, Secretary.

Office, Room 38, Crocker Building, San Francisco, California.

POSTPONEMENT.

Upon resolution of the Board of Directors of the Gold Bar Consolidated Mining Company, the day of sale for the above delinquent stock was postponed until WEDNESDAY, October 21st, 1896, at the hour of 2 P. M., at the office of the company, Room 38, Crocker Building, San Francisco, California. E. C. GODFREY, Secretary.

POSTPONEMENT.

Upon resolution of the Board of Directors of the Gold Bar Consolidated Mining Company, the day of sale for the above delinquent stock was postponed until MONDAY, November 16th, 1896, at the hour of 2 P. M., at the office of the company, Room 38, Crocker Building, San Francisco, California. E. C. GODFREY, Secretary.

IMPROVED MINERS' LANTERN.

A light, simple, cheap and efficient Lantern, which will remain lighted in the strongest drafts. County or State rights for sale on royalty. MRS. HATTIE DELZELL, Jackson, Cal.

Assessment Notices.

CHALLENGE CONSOLIDATED MINING COMPANY. Location of principal place of business, San Francisco, California. location of works, Gold Hill, Nevada.

Notice is hereby given that at a meeting of the Board of Directors held on the 16th day of October, 1896, an assessment (No. 22) of Ten (10c) Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 35, third floor Mills building, corner Bush and Montgomery streets, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 17th day of November, 1896, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on TUESDAY, the 8th day of December, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

C. L. McCOY, Secretary.

Office Room 35, third floor Mills building, corner Bush and Montgomery streets, San Francisco, California.

THORPE MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Calaveras County, California.

Notice is hereby given that at a meeting of the Board of Directors held on the 14th day of October, 1896, an assessment (No. 4) of five (5c) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, No. 507 Market street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 12th day of December, 1896, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on SATURDAY, the 9th day of January, 1897, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

A. F. FREY, Secretary.

Office—No. 507 Market street, San Francisco, California.

GREENWOOD GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Greenwood, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 16th day of October, 1896, an assessment (No. 1) of two (2c) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 79, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 23rd day of November, 1896, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 14th day of December, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHAS. E. ELLIOT, Secretary.

Office—Room No. 79, Nevada Block, No. 309 Montgomery street, San Francisco, California.

GOLD RIDGE CONSOLIDATED MINING AND MILLING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Nevada and Sierra Counties, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 20th day of October, 1896, an assessment (No. 9) of two and one-half (2½c) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Rooms 12 and 13, No. 43 Sixth street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 21st day of November, 1896, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 14th day of December, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

WM. F. McLAUGHLIN, Secretary.

Office—Rooms 12 and 13, No. 43 Sixth street, San Francisco, California.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from W. H. Allbright, in his mine near Placerville, El Dorado Co., to deposit tailings in a ravine below the mine; from W. P. Miller, in the Wild Cat Mine, near Montezuma Hill, Nevada Co., to deposit tailings in Blind Shady Creek; from John Freeman, in the Burlington Mine, near Logansville, Sierra Co., to deposit tailings in Nigger Creek; from Isaac Blomquist, in the Little Boulder Creek Mine, near Sierraville, Sierra Co., to deposit tailings in a ravine below the mine; from Hall & French, in their mine near French Corral, Nevada Co., to deposit tailings in an old pit; from Moulton & Eckman, in their mine near French Corral, Nevada Co., to deposit tailings in an old pit; from David Corbett, in the Linda Placer Mine, near Gibsonville, Sierra Co., to deposit tailings on a flat; and from James E. Roelke, in the Divide mine, near Kelsey, El Dorado Co., to deposit tailings in a ravine below the mine—gives notice that a meeting will be held at Room 59, Flood Building, San Francisco, Cal., on November 2, 1896, at 1:30 P. M.

FOR SALE.

Gold Mining Property,

Situated in the Silver Peak and Red Mountain Mining District, Esmeralda County, Nevada, the property of James O'Hale, deceased, comprising three claims well developed, mill site and spring, 2-stamp mill, engine (6 H. P.) and boiler, complete set of tanks and all requisites for cyanide process, mining tools, horse and wagon, two sets of harness, comfortable house—all to be sold as a going concern. Offers will be received by STAFFORD O'NEILL, postoffice address Silver Peak, Esmeralda County, Nevada.

A Position Wanted

By a Practical Mining and Mill Man, a party having had sixteen years of experience on the Comstock and fifteen years in California gold mining and milling and understands the practical mining and milling in every branch and detail. He is also a first-class accountant. The best of references given. No objection to going into foreign country, as the party speaks English, German, French, Spanish and Dutch.

Address "Practical Miner,"

Care of Mining and Scientific Press, S. F.

WANTED,

A position as Superintendent or Assistant Superintendent in copper-silver or silver-lead smelting works.

Understands mining, sampling, assaying, furnace management, handling men.

Prefer Mexico or Spanish South America. Speaks Spanish. Best references.

Address METALLURGIST, this office

GOLD MINE FOR SALE.

Covering Over 6000 Feet of the Mother Lode with Extensive Developments and Improvements.

Working Bond on Liberal Terms will be Given. Address O. H., Mining and Scientific Press Office.

Stamp Mills, Ore Feeders

DETACHABLE BUCKET WIRE-ROPE TRAMWAYS,

Roller Grinding Pans, Desulphurizing Furnaces, Etc.

Improved Self-Contained Cushion-Frame Five-Stamp Mill.

Patented in the United States and Foreign Countries.

The Improved, Iron-Frame, Self-Contained, Cushion-Frame, Five-Stamp Mill Saves Bills for Heavy Timbers, Millwright and Mechanics' Labor, and a Large Amount of Space. The term "Setf-Contained" Means a Great Deal to the Mine Owner, and Can Be Readily Recognized and Appreciated in Making an Estimate For an Ordinary Five-Stamp Plant, When the Comparative Cost is Considered Over a Wood-Frame Mill.

FIRST: There is Saved by the Use of This Mill a Large Bill for Heavy Timbers, in Many Instances Obtained at Great Expense and Loss Of Time.

SECOND: The Saving in Mill-Wright and Mechanics' Labor in Framing and Erecting.

THIRD: The Large Amount of Space Saved.

Late improvements in the amalgamation and concentration of ores enable us to offer to the mining public, in connection with our Self-Contained Mills, an apparatus which amalgamates and concentrates at the same operation and provides a perfect trap for escaping quicksilver. Write to us for information.

CORRESPONDENCE SOLICITED.

DEWEY & CO., Patent Solicitors,

220 MARKET ST., SAN FRANCISCO.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will have inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address **DEWEY & CO., Patent Agents, 220 Market St., S. F.**

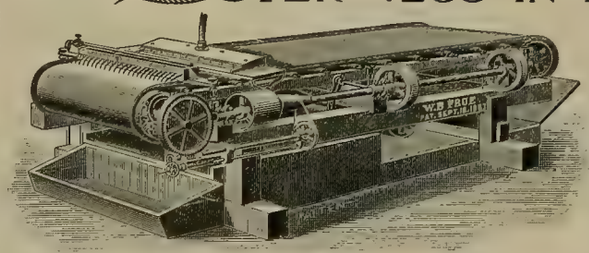
FRUE ORE CONCENTRATOR.

OVER 4200 IN ACTUAL USE.

Manufactured under Patents of

April 27, 1880;
September 18, 1883;
July 24, 1888;
March 31, 1891.
July 18, 1893.



It can be safely stated, without going into a description of several new and untried concentrators that have lately come into the market, that where sulphurets are of such value as to make close saving necessary, the Frue Vanner is always used. It is the only endless belt concentrator in the market that can be relied on to handle all classes of ores, and give universal satisfaction. (In all competition of concentrators the Frue Vanner is taken as the standard machine of the world and all comparisons made by it. There have been over 4200 of these machines sold, 1700 having been sold on the Pacific coast alone.) They are in use in every part of the world where mining is carried on and in all cases they are giving perfect satisfaction. From time to time valuable and important improvements have been made in this machine to increase its capacity and durability, and particular attention is called to the Patent Lip Flange for the rubber belt, which does away with nearly all the strain and cracking, as in the old style of flange, making the life of belt more than double that of other style belts in the market. The lip of flange bends outward in going over the large end rolls, thereby distributing the strain in the solid rubber, and bringing virtually no strain either at the edge or at the base of flange, as is the case in all belts with a raised edge.

For any information, pamphlets, circulars or testimonials, call on or address

Price of 4-foot wide Plain Frue Vanner ..... $500, f. o. b.

Transmission of Niagara Power to Buffalo.

The progress that has been made in the construction of the Niagara-Buffalo power transmission line is noticeable. Though not as long as some of our California electrical transmission projects, as for instance at Sacramento or Fresno, in this State, yet the commercial importance of the Eastern line is so great as to entitle it to notice. For nearly twenty-six miles this link of copper stretches across the country, and as there are three cables, or one three-phase system, the total length is nearly seventy-eight miles. The pole line ends about 300 feet north of Brace street, in the city of Buffalo, at which point the conduit work commences, and for the last 4200 feet the cables will be laid under ground. Work was begun August 14, 1896, and nearly 200 men started setting poles. In length the poles vary from 35 to 65 feet. They are of white cedar, shaved.

The illustration portrays the manner in which the conduit was constructed along the Bank of the Erie canal in Buffalo. The conduit is formed by twelve vitrified tile ducts, each 3 inches in diameter in the clear. They are laid in concrete, with 4 inches as the minimum protection on all sides. The depth of the conduit trench is about 40 inches. The average depth of the soil covering over the conduit is about 18 inches. In no place does the conduit approach the edge of the canal bank nearer than 14 feet, its inside line holding close to the 16-foot mark. There are sixteen manholes along the line of the conduit, their location being governed by the condition of the locality. These manholes are octagonal in form, with an interior of 5 feet. They have a brick wall of 12 inches, the bottom being formed by 6 inches of concrete and one layer of brick. In the construction of the conduit the surplus earth was loaded on to scows and carried out in the river and dumped. The terminal house will be of brick, with an interior of 16x9 feet and a height of 22 feet. From the last manhole of the conduit to the terminal house there will be a short tunnel about 4 feet long. The anchorages of the cables will be on the poles outside. The cable to be laid in the conduit will be lead-covered, guaranteed to stand a pressure of 20,000 volts. The first transmission, however, is to be at 10,000 volts. This lead cable will be carried upon a trestle inside the terminal house, where the ends will be sealed, and a rubber insulated wire without lead will be carried out as far as the first pole, the distance probably being about 20 feet, and there it will be connected with the bare copper cable of the pole line. The cable of the line is of 350,000 C. M. It is shipped on reels weighing about 2800 pounds and containing about half a mile of cable. In connecting the ends the inner core is removed and a half-connection made, which is soldered. In stringing the cables the reels are loaded on a cart having wheels 5 feet 4 inches and a tread of 3 inches. In this way the cable is run out, and the simple movement of a lever brings it up taut on the poles, which are set from 60 to 75 feet apart, the distance being varied to overcome the deflections of the spans. Complete transposition is effected every five miles, and at these five points on the line two poles, which are 5 feet higher than the adjacent poles, are placed.

In turning corners six poles and double crossarms are used in order to distribute the strain of the cable on six, instead of three, pins. The pinholes have a depth of 4 inches and all have drainage holes in them. The pins are boiled in linseed oil and their butts are painted. They are not nailed in position until after the double-petticoated insulators are screwed on. The upper crossarms are prepared for pins on which galvanized iron barbed wire will be strung at a height of about 18 inches to afford protection from lightning. These wires will be grounded at frequent intervals.

TRANSMISSION OF NIAGARA POWER TO BUFFALO.—A SECTION OF THE CONDUIT IN BUFFALO.

The expectation is that Niagara power will be sent to Buffalo before the close of this month, but it is evident that the power company will not have any great amount of power to send to that city before the wheel-pit extension is finished.

For the past six months the newspapers published in the mining districts have been devoting less and less attention to mining as the election approached. In the meantime there has been a greater increase in the interest of the people in that industry than ever before. This has been going on, too, in spite of the fact that in all other industries capital has been "waiting until the election is over."

The Geological Survey and Mining.

The United States Geological Survey has, under the present regime, shown a commendable interest in the mining industry. This is only fair, for it is to mining more than anything else done by the hand of man that the geologist owes his knowledge of nature's secrets. For centuries, the world over, the deep mines have furnished him with the best data that he has obtained.

More than that, the necessity on the part of the miner for a knowledge of geology has more than anything else led to the present great interest taken in the subject by the public at large. But for the mining industry there would now be little need, from a practical point of view, for the United States Geological Survey; and but for the mining industry, it would not now receive at the hands of the Federal Government the liberal support it now has. But for the mining industry the great State Geological Surveys that have done, and are doing, much for science would not have been inaugurated.

It seems but fair, then, that some return should be made and that the work of the surveys should be so regulated, where practicable, as to be of use to the mining industry.

Director Walcott seems to appreciate this fact. Timely reports upon newly discovered mining districts were unknown a few years ago. Now it is to these places that he is sending his best men. Cripple Creek, Colorado, Mercur, Utah, the new districts in the Black Hills, the gold fields of Alaska and other districts have been visited. On some of them reports that are of value to the mining engineer, the investor and others have been published in time to be available. It has too often been the custom to send the geologists to old or worked out districts, and the reports, while valuable from a scientific point of view, have been of no practical use.

The intelligent conception of the value of the Survey's work to the mining industry on the part of Director Walcott gives promise that he would lend careful consideration to recommendations from representative bodies of mining men. There is work that can be done in this State that would be of value, and it seems to us that it is the province of the coming Miners' Convention to bring the matter to the attention of the director.

We publish in this issue an article written by Mark B. Kerr, in which he advocates that a good topographic and geologic map be made of the mother lode. There has never been any system or plan about the work that has been done in California, either by the State or by the United States Geological Survey. Now that the State Mineralogist proposes that a systematic survey be undertaken by the State, it is very important that the Federal Government should be asked to carry out its plan of a topographical survey and to base it upon such lines as would make it of value to the State survey. A thorough survey of the mining belts of California would be of great value at the present time, and for years to come, while so much prospecting is to be done.

The Miners' Convention.

The California Miners' Convention will meet in this city on Tuesday next. No calling can bring together a better body of men than that of mining, and in no part of the world is the industry represented by larger-minded and more public-spirited citizens than in this State. They meet, not to ask something from the public, but simply to consider what they may best do themselves for their common good. To mining this State owes much, and the deliberations of the coming convention will be looked forward to with interest by all classes, for upon the welfare of the industry represented much depends to all.

Eminent Domain in Mining.

In addition to the proposed mining laws published in last week's issue, and which we republish in this issue because of the large demand for copies of them, we present a proposed amendment to the State Constitution declaring mining a "public use," to the end that the owner of a mining claim may maintain proceedings in condemnation in order to run tunnels and secure other necessary rights of way. The State Legislature has endeavored to give to the miner this right, but has been prevented by the Supreme Court, holding that mining is not a "public use."

In explanation of the proposed amendment, we have been furnished with the following data, which covers the ground very fully, by Mr. A. H. Ricketts of this city:

In the State of Nevada mining is declared to be a "public use" by legislative enactment and the decisions of the Supreme Court (Mining Co. v. Seawell, 11 Nev., 394; Mining Co. v. Corcoran, 15 Nev., 147), and the owner of one mining claim may maintain proceedings to condemn another mining claim, or a part thereof, if necessary to the working of the claim. In Douglass v. Byrnes (59 Fed. Rep., 29), it appears that the owner of a patented mining claim located a tunnel right, under the Federal mining laws, between the mouth of which and the said patented mining claim lay five different mining claims, of which three were patented and the other two held under a possessory title. It being necessary for the tunnel to pass through these five claims, the tunnel locator commenced condemnatory proceedings, and Judge Hawley, before whom the case was tried, held that as it appeared that the appropriation of the right of way through the said mining claims would be of great benefit and advantage to the mining district in which the claims were situated, and that it was necessary to condemn the lands asked for in the petition, which was the right of way for a tunnel 7½ feet wide by 7½ feet high, through said intervening claims, for the protection and advancement of said interests, and that the benefits arising therefrom were of paramount importance as compared with the individual loss, damage or inconvenience to the owners of such claims.

In the course of the opinion Judge Hawley says "a tunnel properly constructed through a mining claim cannot, as a general rule, be said to seriously interfere with the rights of the owner. Ordinarily, the running of such a tunnel would prove to be of great advantage and a benefit to the several mining claims through which it passes; and especially would this be so if proper provision could be made for the owners of such claims to have the use and occupancy thereof, in common with others, for the purpose of working their respective mines. But in any event it is difficult to see what particular objection can be urged to the running of the tunnel, if proper damages are assessed for the injury that may be caused to the mining claims through which it passes."

See, also, Bliss. v. Kingdom, 46 Cal., 652; Correa v. Frietas, 42 Cal., 339; compare Amador Q. M. Co. v. De Witt, 73 Cal., 482.

The Supreme Court of California construes the words "public use" to mean a use which concerns the whole community as distinguished from a particular individual or a particular number of individuals. Gilmer v. Lime Point, 18 Cal., 229.

In the case of Dower v. Richards (73 Cal., 477,) the Supreme Court held that no man can tunnel under part of a lot held under a townsite patent issued before the passage of the act of 1872, except by contract with the owner, as the use attempted to be obtained in tunneling the defendant's land was not a public use, and no valid State law authorizes it. But in the course of the opinion the court further said: "There was no valid law of State or United States existent which at the time of the issuance of the townsite patent prescribed any method of working a "gold mine" so situated. Therefore the title to the gold mine and its *locus* remained in the United States government, but that government not having legislated so as to impose any method of working said mine as a condition or restriction upon the fee simple holding of the part of the lot where there was no gold mine, owner of the lot held it absolutely, subject only to the right which might be given by a constitution or State law to condemn it for a public use."

Section 2328 of the Revised Statutes of the United States provides that "as a condition of sale, in the absence of necessary legislation by Congress, the local Legislature of any State or Territory may provide rules for working mines, involving easements, drainage, and other necessary means to their complete development, and those conditions shall be fully expressed in the patent."

On March 31, 1891, an act of the Legislature of California relating to the working, right of way, easement and drainage of mines in that State was approved. Section 2 of that act is as follows:

"All mining locations and mining claims shall be subject to a reservation of the right of way through or over any mining claims, ditches, roads, canals, cuts, tunnels and other easements for the purpose of working other mines: *Provided*, That any damage occasioned thereby shall be assessed and paid for in the manner provided by law for land taken for public use under the right of eminent domain."

With reference to a somewhat similar statute (act of April 1, 1870, Stats. 1869-70, 569), the Supreme Court of California in Bliss vs. Kingdom (46 Cal. 652) did not discuss the constitutionality of the act, but held that the "act of 1870 providing for the condemnation of the right of way over or through a mining claim for ditches, flumes, etc., necessary for the convenient working of another mining claim, is merely cumulative, and does not have the effect of excluding a party from the enforcement in court of the right to construct such tunnels, ditches, flumes, etc., when that right exists independent of the statute, as by local customs." See, also, Titcomb vs. Kirk, 51 Cal. 288; Correa vs. Frietas, 42 Cal. 339.

But in the more recent case of Amador Q. M. Co. vs. De Witt (73 Cal. 482) it appears that the defendant obtained a patent from the United States for his mining claim in May, 1882, which contained, among other things, the following condition of sale inserted in pursuance of Section 2338 Rev. Stats.: "That in the absence of necessary legislation by Congress, the Legislature of California may provide rules for working the mining claim or premises hereby granted, involving easements, drainage and other necessary means of its complete development." The plaintiff sought to condemn a right of way through a tunnel under defendant's mining claim. The court said there was and is no legislation by Congress providing for working mines, and none by the State except Section 1238 of the Code of Civil Procedure, and that its language could not be construed to be such a reservation as would justify an action to condemn a right of way through a tunnel under defendant's mining claim; that the mine of defendant is his private property, and it is clear that the plaintiff asks for the condemnation in order that it may appropriate a way through that property for its private use. This cannot be done. It was held in Con. Channel Co. vs. C. P. R. R. Co., 51 Cal. 269, that mining like the plaintiff's is a private industry and that private property cannot be condemned for such a use.

Therefore it would seem to follow that although Sec. 1238, Subdivision 5, C. C. P. (amended March 6, 1896, Stats. 1895, p. 66) is a legislative declaration that the construction of roads, tunnels, ditches, flumes, pipes and dumping places for working mines; also outlets, natural or otherwise, for the flow, deposit or conduct of tailings or refuse from their several mines are public uses in which the right of eminent domain may be exercised, still the doctrine that the judgment of the Legislature upon such questions is held not to be conclusive in California, and is open to review by the judicial department of the Government. In other words, it devolves upon the courts to determine whether or not the case is a public use. Santa Ana vs. Harlan, 99 Cal., 538.

And the Supreme Court has held that a right of way through a mining claim for the public use of another mine owner in working his mine cannot be the subject of the exercise of the right of eminent domain. Amador Q. M. Co. vs. Dewitt, 73 Cal., 482.

Neither can it be exercised so as to enable a person to build a flume on the land of another to carry off the tailings from his mine or to enable him to deposit tailings on such land. Con. Channel Co. vs. C. P. R. R. Co., 51 Cal., 269. Nor in favor of the owners of mining claims to enable them to obtain water for their own use in working such claims, though the intention may also be to supply water to others for mining purposes. Lorenz vs. Jacobs, 63 Cal., 71.

And where a railway was constructed and was operated exclusively in carrying coal from the mines belonging to the railroad company, no passenger or other cars being provided for the use of the public, it was held that the proceedings in condemnation of sufficient land for the purposes of the railway amounted to an imposition upon the court before which they were had, as the lands were sought to be taken for private use. People vs. Pittsburgh R. R. Co., 53 Cal., 694.

In Jacobs v. Day (111 Cal. 571) the court held that the use of water for the purpose of carrying off the tailings, and the construction of a ditch to aid therein, are essential to the successful conduct of hydraulic mining, and that the title to an adjoining mine passes under a patent from the United States, subject to the easement of this right of way for a ditch used in accordance with local mining customs, as a tail race from a hydraulic mine across the patented ground. But that decision, while it assumes certain rights in the hydraulic miner, did not involve the right of eminent domain but the question of the acquirement of a right of way by prescription and a construction of the Federal mining law.

It would therefore seem that in this State its Legislature gives to the miner a right which is denied him by the courts, because mining is not in their opinion a public use, and resort must therefore be had to a constitutional amendment to give effect to the legislative intent. And, to quote the apposite language of Judge Hawley: "The importance of encouraging the mining industry of this State must be kept in view. This was the object, intent and purpose of the Legislature in passing the act (Sec. 1238, C. C. P.), and its wisdom, policy and expediency were thereby determined."

Robbery of Ore From Mine and Reduction Works.

At the suggestion of several of the leading members of the California Miners' Association who have read the proposed mining laws published in the PRESS last Saturday a further bill is submitted, entitled "An act relating to the purchase of ores." The bill is intended to provide a means for the ascertainment of the robbery of ores from mines and reduction works by compelling the purchasers of ores to keep a record thereof, under a penalty therein provided, and is as follows:

The people of the State of California, represented in Senate and Assembly, do enact as follows:

SECTION 1. That every person, association or corporation that shall be engaged in the business of milling, sampling, concentrating, reducing, shipping, or purchasing ores in the State of California shall keep and preserve a book in which shall be entered at the time of the delivery of each lot of ore:

First.—The name of the party on whose behalf such ore is delivered, as stated.

Second.—The name of the teamster, packer, or other persons actually delivering such ore, and the name of the owner of the team or pack train delivering such ore.

Third.—The weight or amount of every such lot of ore.

Fourth.—The name and location of the mine or claim from which it shall be stated that the same has been mined or procured.

Fifth.—The date of delivery of any and all lots or parcels of ore.

SEC. 2. Whenever affidavit shall have been made before any police judge of any town in this State, or any justice of the peace of any county, by any person, that ore has been stolen from him, stating as near as may be the amount and value of the ore stolen, such person upon presentation of a certified copy of such affidavit, shall have access to such book, and may examine the entries which may have been made therein during a period of fifteen days next preceding the filing of such affidavit: *Provided*, That the person making such affidavit shall, at the time of making the same, have a present interest in the product of the mine or claim from which said ore has been stolen, or in the ore alleged to have been stolen.

SEC. 3.—Every person, association, or corporation that shall fail or refuse to keep the book required by the terms of the first section of this act, or shall fail or refuse to make any proper entry therein, or who shall make any false entry therein, or who shall refuse to any person who may be entitled to the same, as provided by section two (2) of this act, the right of inspection thereof, shall forfeit and pay for each and every violation of the provisions of said section a penalty of not less than fifty (50) nor more than three hundred (300) dollars, to be collected at the suit of any person who may sue for the same. In addition to such penalty, any person, association or corporation violating the provisions of said first section, shall be liable at the suit of the party or persons aggrieved, in the proper form of action, for all damages which may accrue to any party or person by reason of such violation. And in all actions the fact that a false entry has been made shall be *prima facie* evidence that the same was made wilfully and knowingly.

SEC. 4. If any person, association, or corporation shall fail or neglect to make the inquiries necessary to the making of the proper entries in said book, as provided in section one (1) of this act, or shall so negligently make entries therein that any lot of ore cannot be particularly identified, or so negligently that it cannot be perceived therefrom what person delivered any lot of ore or received the proceeds of the same when purchased, or shall fail to keep such book, or shall wilfully suffer the same to be lost, or mislaid, so that the same cannot be produced for inspection, such failure or neglect shall not excuse any party defendant in any suit brought under the preceding section from judgment for any penalty prescribed by said section.

Concentrates.

ARIZONA'S mineral output in '95 was a little over $14,000,000.

THERE are about 500 people in the Mogollon district in New Mexico.

IT is proposed to erect a cyanide plant in the Randsburg district in Kern county.

OVER 600,000 ounces of gold were obtained by the cyanide process in the Rand in 1895.

OVER $15,000 in gold dust was shipped from Grant's Pass, Oregon, last month by one house.

A CONTRACT has been let for the erection of a 40-stamp mill in the Allen mine, in Amador county.

THE railroad company is attempting to patent land in Trinity county which is beyond question mineral.

SNOW in the Sierras already reaches as far down in the foothills as Shady Run, Placer county, Cal.

SAN FRANCISCO Mint coinage for the first nine months of '96 was $26,361,461; '95, $21,024,713; '94, $20,656,452.

WAGES in the Randsburg mining district in Kern county are $2.50 to $3 per day, but there is no want of men.

IN the recent political campaign Colorado and Montana each contributed $200,000 to the silver campaign fund, and Utah $100,000.

THERE are in the Butte, Montana, mining district 4000 patented claims, 3000 of which are silver and 1000 copper.

THE recent fall in silver was largely occasioned by the inability of speculators to carry what they had purchased with borrowed money.

THE next meeting of the California Debris Commission will be held at room 59, Flood Building, this city, at 1:30 P. M., on the 16th inst.

THE A. O. & M. C ny of onsville, Idaho, have received mint certificates for $225,000 worth of gold since last January.

ON a trip to the mines at Randsburg a visitor recently counted sixty-eight teams on the road from Mojave, all bound for the mines.

TO DO even a day's work in mining for gold or silver in British Columbia a man must pay a tax of $5, but there is no such charge for coal mining.

IT IS understood in Rossland, B. C., that a hitch has occurred in connection with the sale of the War Eagle. It is stated that the payment now almost due will not be made.

IN another week the newspapers will get through with their present task of explaining how it all happened and resume publication of news affecting interior development.

THE Union Gold Mining Company, of which Judge Williams is president and A. Harpending manager, has commenced the construction of a 20-stamp mill on its mine near El Dorado.

WELL, the nation has decided! Majorities rule, and now 'tis best for all to "get together" and work for the common good. We've had politics enough for a while; now for business.

THE manager of the Jackson Exploration and Development Company, in Amador county, has received cable instructions to sink the shaft in the Amador Queen to a depth of 1000 feet.

MANY of the items on this page every week are condensed answers to questions received at the office by mail, which are deemed of sufficient public interest to merit a concentrated reply.

THE Consolidated Deep Levels, Limited, of South Africa is a case of a mine that is not over-capitalized. It has lately declared a dividend of £60,000, or 30 per cent, which is the fourth paid.

THERE has been considerable increased excitement in Vancouver and Victoria, B. C., over mining, particularly over the reports from the Cayuse creek discoveries and those on Tascado island.

IT is claimed that in the new Deep Creek district in Utah, in which Standard Oil Co. people have lately made investments, there is ore enough blocked out to keep up a production of 200 to 300 tons a day.

THE last quarterly report of the Argentum-Juniata of Colorado, ending October 1, '96, shows a shipment of 105,971 ozs. of silver, with a value of $68,212.12, that left a net profit, after deducting all expenses, of $20,556.91.

THE suit brought by the Virtue Mining Company against George W. Grayson to obtain possession of the now rich Virtue mine in northeastern Oregon, has been decided in favor of the defendant by the Supreme Court of Oregon.

THE Government has let a contract for carrying the mail between Juneau and Circle City, Alaska. The distance is 898 miles and the contractors are to make four trips between November 1, 1896, and May 31, 1897, and will receive $1,700 for each.

ON Nov. 17th, 1859, snow began falling on the Comstock, Virginia City, Nevada, and continued for five days, attaining a depth of nearly five feet. It lay on the ground ninety days. That is the severest winter western Nevada residents remember.

SECRETARY OF THE INTERIOR FRANCIS has decided that California is entitled to indemnity selections for school lands returned as mineral by the surveyors, and that their field notes shall be taken as conclusive evidence that the land is mineral.

RICH coal deposits are reported to have been discovered in western Ontario, Canada, in the district of Algoma. Some Lehigh valley people have made an offer of $1,000,000 to the present owners if they will sell all their holdings in the whole district.

HUGH MCDONNELL AND JAMES SALEE, who were interested in the Iron Mountain mines of Shasta county until they were sold to the English company, have purchased for $50,000 the Compromise mine, near Tehachapi, and will begin to operate it immediately.

FROM the way unsolicited new subscriptions are coming in, it looks as though this would be the banner year for the increase in circulation of this paper. Nearly every old subscriber, in renewing for another year, takes occasion to write a kindly word for the paper, which is duly valued and appreciated.

THE Black Warrior Copper Company, recently organized in New York by James A. Flemming and J. M. Ford of Phoenix, Arizona, and W. H. Nichols and Mr. Langetrouth of New York, to erect reduction works on the Black Copper group at Globe, will commence work at once upon two large reverberatory furnaces.

A LARGE proportion of the mines of the Kootenay country are owned by corporations formed under the laws of Washington. But the other day a company was formed with its head office in Rossland, under the laws of British Columbia, which is registered in Washington, for the purpose of operating mines on this side of the line.

SOME of the leading mine operators at Leadville say that they have been approached by delegations representing the striking miners offering to declare the strike off, provided that no discrimination shall be made in hiring men, but have refused. As soon as the down-town companies shall have resumed, nearly all the mines closed by the strike will be again in operation.

REPORTS come from Ottawa, Canada, that William Ogilvey, who is in the Yukon district in connection with the delimitation of the Alaska boundary, has made a report to the Minister of the Interior, stating a great gold find has been made on the Bonanza creek, which flows into Deer river about forty miles from Fort Cudahy. Mr. Ogilvey said that 200 claims had been taken up and there is room for 1000 more. The department will send an officer to see that the claims are laid out properly, so as to avoid disputes.

THOSE who have not as yet done the required $100 worth of work or improvements on the unpatented claims held by them, for the twelve months ending midnight, Dec. 31, 1896, should bear in mind that but fifty-five days remain in which such work must be done, and that the law is mandatory on that point. It is also necessary that proof of such work be filed with the recorder.

THE term "lode" is in general preferable to the term "vein." A lode is more general than a vein, and there may be a number of veins in a lode, while a "vein" cannot contain a "lode." A lode includes everything between the hanging and foot walls, and, if even outside, there may be an impregnation of country rock of equal value to that in the fissure, that also is a part of the "lode."

AN engineer of the Mountain Mines Company of Shasta county has been over the ground to Humboldt Bay to gather data as to the feasibility of building a railroad from the company's mines. Numerous preliminary surveys for both rail and wagon roads have been made from this bay to the Trinity, Shasta and Tehama boundary lines, and the report has always been that entirely feasible routes offered in each instance.

THE report of the Alaska Treadwell Company for the month ending September 15, '96, shows a total yield of $59,391.27; expenditures, $27,127.40; profit, $32,263.80. From the mill in free gold $40,157 was obtained from 22,250 tons of ore, an average of $1.8048 per ton, and from the chlorination works $19,234.27, an average yield of $0.8645. The total average yield was $2.6693 per ton, the cost per ton $1.2192, and the profit per ton $1.4501.

MINING is attracting considerable attention to Lower California and the capital, Ensenada, is taking on the appearance of a mining center. Last week an expedition gotten up by Lacy Brothers of Los Angeles, consisting of twenty-five men and forty animals, left on the yacht Penelope, bound for San Francisquita, 350 miles south of Ensenada, near the silver mines of Cranz Brothers, where it is claimed rich discoveries have been made.

THE badge of the California Miners' Association for '96 represents Marshall at the moment of his discovery of gold in California. His right hand is outstretched and in the hand is held a golden nugget. The other hand rests on the pick that has brought to light the little piece of precious metal. The body of the badge is in white metal, while the nugget is of the golden hue. Below the figure of Marshall are the letters "C. M. A."—California Miners' Association.

THE 110 stamps at the Drum Lummon mine at Marysville, Montana, were all hung up last Saturday. A force of seventy-five men will be retained to prospect the mines and try to discover paying ore bodies. From the 600 to the 1600 level a barren zone was passed through, and now, in order that the ore body, if it exists at all, should not escape, they are driving a long level at the 1600 in that southerly direction in which the Montana ore bodies are known to dip.

PROSPECTING in British Columbia, Washington and Idaho is about over for the season and prospectors are coming into Spokane and other places, looking for winter quarters. The past season has witnessed great progress in the mining camps around Spokane. The principal work has been done in the north, although all around to the east, south and west the hills and mountains have been tramped over by the hardy prospectors and many promising prospects located.

THE oil well that was being sunk in the San Timotee hills in Riverside county, reached a depth of 475 feet, when the apparatus got stuck and the enterprise was abandoned. It has not been demonstrated that there is any great quantity of oil in the hills, but it has shown conclusively that there is a great amount of water—far more than any person expected would be developed—and that discovery may prove more valuable than would have been a moderate development of petroleum.

THE mill upon the old San Jose property in Egan Canyon, White Pine district, Nevada, has again been started up. Under former owners this property produced a great amount of bullion, but was closed down about fifteen years ago. Not long since the stock was purchased by John Heimrich and others of the Mercur Mining Company for $30,000, and a new corporation—the North Mountain Mining Company—was formed. It is claimed that there are large quantities of ore that will, with improved methods of working, pay well. This is an old story that is being happily retold in many a mining camp all over the Pacific Coast.

A CORRESPONDENT writing from Mercur, Utah, to the Salt Lake *Tribune* says: "To those who have never visited the district it is almost impossible to form an idea of the vast wealth contained in the hills. It has been demonstrated that the ore underlies the whole country from the Northern Light to Sunshine, a distance of eight miles, and from the East Golden Gate to the western foothills, a distance of about four miles. Putting the average depth of the vein at 10 feet—a very low estimate, by the way—and you have thirty-two square miles of gold ore, 10 feet deep. Estimate the value of this mineral body at an average value of $5, and you will have some idea of the extent of the mineral body in Camp Floyd district."

IN South Africa the native laborer has little to say as to what his wages shall be, and he is not allowed to strike or form unions. When the supply runs short more natives are brought in from the wilds, and the rate of wages is kept down to that fixed by the mine owners. Not long since the association of mine owners agreed upon a reduction of wages all round. Then with the assistance of the Government a demonstration of armed police and volunteers along the mines was made to overawe any natives who made the reduction of wages an excuse for disturbance. The official reason for these military preparations was the need for precaution against a native riot. The Chamber of Mines drew the attention of the Government to such a possibility.

THE Presidential election of the 3d inst. called out all the political forces of the country. Nearly 13,000,000 votes were cast in the nation. Out of the electoral vote of 447, Wm. McKinley, of Ohio, has 280; W. J. Bryan, of Nebraska, 167. The popular vote also included Congressmen from the various States, which results in the election of a Republican majority. In California three Democratic and four Republican Congressmen are elected. In the Second Congressional district Grove L. Johnson, who is charged with having helped beat the Mineral Land bill in Congress last winter, was badly beaten by his Democratic opponent. California's electoral vote is in the victorious McKinley column. It is thought that the successful Republican candidate will have nearly one million plurality in the general total. Elsewhere will be found a portrait and brief biography of the man who will be the 25th President of the United States.

Needed Mining Laws.

The demand for last week's issue of this paper containing the following matter was so great that it has been deemed advisable to republish it for the use and convenience of the visiting delegates to the Miners' Convention.

We have in this State most inadequate and unsatisfactory laws in regard to the location and manner of recording mining claims and other matters affecting the mining interest. This is shown by the constant litigation over points that should long ago have been settled by a simple code. There has been very little legislation to supplement the Federal mining law, and we have had nothing to depend upon but the court decisions, which have been unsatisfactory, inadequate and often conflicting. Recognizing that with the growing importance of the mining industry there is an increasing need for good laws to make more certain the rights of the locator, the mine owner, and the working miner, the MINING AND SCIENTIFIC PRESS has had prepared by the well-known mining attorney of this city, Mr. A. H. Ricketts, drafts of proposed bills to be submitted to the coming Miners' Convention for appropriate action.

These bills seem to us to cover the ground well, but we shall be very glad to receive criticisms and suggestions from miners and others interested in order that a good beginning may be made toward obtaining as perfect a code of mining law as possible. The bills as presented are made up from the mining laws of all the States and Territories.

We would refer our readers to an editorial in the issue of Oct. 31, where the essential points were more fully discussed.

Duties and Rights of Locators.

This bill as to how mines shall be located, the manner of recording mining claims, mill sites, tunnel rights, and as to annual assessment work and the rights of co-owners, is made up from the best provisions of the mining laws of different States and Territories, with new and additional provisions not found in any other laws as to mill site and tunnel right locations:

AN ACT RELATING TO THE LOCATION, RELOCATION, MANNER OF RECORDING LODE AND PLACER CLAIMS, MILL SITES, TUNNEL RIGHTS, AMOUNT OF WORK NECESSARY TO HOLD POSSESSION OF MINING CLAIMS AND THE RIGHTS OF CO-OWNERS THEREIN.

The People of the State of California, represented in Senate and Assembly, do enact as follows:

SECTION 1. Any person, a citizen of the United States, or one who has declared his intention to become such, who discovers a vein or lode may locate a claim upon such vein or lode by defining the boundaries of the claim in the manner hereinafter described, and by posting a notice of such location at the point of discovery, which notice must contain: (1) the name of the lode or claim; (2) the name of the locator or locators; (3) the date of the location; (4) the number of linear feet claimed in length along the course of the vein, each way from the point of discovery, with the width on each side of the center of the vein, and the general course of the vein or lode as near as may be.

SEC. 2. Before the expiration of ninety days from the posting of such notice upon the claim the locator must sink a discovery shaft upon the claim located to the depth of at least 10 feet from the lowest part of the rim of such shaft at the surface, or deeper if necessary to show by such work a lode deposit of mineral in place. A cut, or crosscut, or tunnel which cuts the lode at a depth of 10 feet, or an open cut of at least 10 feet in length along the lode from the point where the lode may be in any manner discovered, is equivalent to a discovery shaft. The locator must define the boundaries of his claim by marking a tree or rock in place, or by setting a post or stone, one at each corner and one at the center of each side line. When a post is used it must be at least 4 inches square, by 4 feet 6 inches in length, set 1 foot in the ground, with a mound of stone or earth 4 feet in diameter by 2 feet in height around the post. When it is practically impossible on account of bedrock or precipitous ground to sink such posts, they may be placed in a pile of stones; or where the proper placing of such posts or monuments of stone is impracticable or dangerous to life or limb, it shall be lawful to place such post or monument of stone at the nearest point, properly marked to designate its right place. When a stone is used, not a rock in place, it must be at least 6 inches square and 18 inches in length, set two-thirds of its length in the ground, which trees, stakes or monuments must be so marked as to designate the corners of the claim located.

SEC. 3. Within ninety days of the date of posting the location notice upon the claim the locator shall record his claim in the office of the recorder of the county in which such claim is situated by a location certificate which must contain: (1) the name of the lode or vein; (2) the name of the locator or locators; (3) the date of location and such description of the location of said claim, with reference to some natural object or permanent monument, as will identify the claim; (4) the number of linear feet claimed in length along the course of the vein each way from the point of discovery, with a width on each side of the center of the vein, and the general course of the lode or vein as near as may be; (5) the dimensions and location of the discovery shaft, or its equivalent, sunk upon the claim; (6) the location and description of each corner, with the markings thereon. Any record of the location of a lode mining claim which shall not contain all the requirements named in this section shall be void. All records of lode or placer mining claims, mill sites or tunnel rights heretofore made by any recorder of any mining district or any county recorder are hereby declared to be valid and to have the same force and effect as records made in pursuance of the provisions of this act. And any such record, or a copy thereof, duly verified by a mining recorder or duly certified by a county recorder shall be *prima facie* evidence of the facts therein stated.

SEC. 4. The location or record of any vein or lode claim shall be construed to include all surface ground within the surface lines thereof, and all lodes and ledges throughout their entire depth, the top or apex of which lies inside of such lines extended downward, vertically, with all parts of such lodes or veins as continue to dip beyond the side lines of the claim, but shall not include any portion of such lodes, veins, or ledges beyond the end lines of the claim, or the end lines continued, whether by dip or otherwise, or beyond the side lines in any other manner than by the dip of the lode.

SEC. 5. If the top or apex of the lode in its longitudinal course extends beyond the exterior lines of the claim at any point on the surface, or as extended vertically downward, such lode may not be followed in its longitudinal course where it is intersected by the exterior lines.

SEC. 6. If at any time the locator of any mining claim heretofore or hereafter located, or his assigns, shall apprehend that his original certificate was defective, erroneous, or that the requirements of the law had not been complied with before filing; or shall be desirous of changing his surface boundaries or of taking in any part of an overlapping claim which has been abandoned; or in case the original certificate was made prior to the passage of this law, and he shall be desirous of securing the benefits of this act, such locator or his assigns may file an additional certificate, subject to the provisions of this act: *Provided*, That such relocation does not interfere with the existing rights of others at the time of such relocation, and no such relocation or the record thereof shall preclude the claimant or claimants from proving any such titles as he or they may have held under previous location.

SEC. 7. The relocation of abandoned lode claims shall be by sinking a new discovery shaft and fixing new boundaries in the same manner as if it were the location of a new claim; or the relocator may sink the original discovery shaft 10 feet deeper than it was at the time of abandonment, in which case the record must give the depth and dimensions of the original discovery shaft at the date of such relocation, and erect new or adopt the old boundaries, renewing the posts or monuments if removed or destroyed. In either case a new location stake shall be erected. In any case, whether the whole or part of an abandoned claim is taken the record may state that the whole or any part of the new location is located as abandoned property. If it is not known to the relocator that his location is on an abandoned claim, then the provisions of this section do not apply.

SEC. 8. Where a locator, or his assigns, has the boundaries and corners of his claim established by a United States deputy mineral surveyor, or a licensed surveyor of this State, and his claim connected with a corner of the public or minor surveys of an established initial point, and incorporates into the record of the claim the field notes of such survey, and attaches to and files with such location certificate a certificate of the surveyor, setting forth: (1) that said survey was actually made by him, giving the date thereof; (2) the name of the claim surveyed and the location thereof; (3) that the description incorporated in the declaratory statement is sufficient to identify. Such survey and certificate becomes a part of the record, and such record is *prima facie* evidence of the facts therein contained.

SEC. 9. The amount of work done or improvements made during each year to hold possession of a mining claim shall be that prescribed by the laws of the United States, to-wit: $100 annually. In estimating the worth of labor required to be performed upon any mining claim, to hold the same under the laws of the United States, the value of a day's labor is hereby fixed at the sum of $3: *Provided, however*, That in the sense of this statute eight hours of labor actually performed upon the mining claim shall constitute a day's labor. Where one person or company owns several contiguous claims capable of being advantageously worked together, one general system may be adopted to work such claims; and work done according to such system for the purpose of prospecting or working all such contiguous claims, although done on only one of such claims, or outside of all of them, shall be available to hold all such contiguous claims intended to be worked or prospected by such general system: *Provided*, That the expenditure of money or labor shall equal in value that which would be required on all the claims if they were separate or independent.

SEC. 10. Within sixty days after the performance of labor or making of improvements, required by law to be annually performed or made upon any mining claim, the person in whose behalf such labor was performed, or improvements made, or some one in his behalf shall make and record in the office of the county recorder in which such mining claim is situated, an affidavit setting forth the amount of money expended, or value of labor or improvements made, or both, the character of expenditures or labor or improvements, a description of the claim or part of the claim affected by such expenditures, or labor or improvements, for what year, and the name of the owner or claimant of said claim at whose expense the same was made or performed. Such affidavit, or a copy thereof, duly certified by the county recorder, shall be *prima facie* evidence of the performance of such labor or the making of such improvements, or both.

SEC. 11. Whenever a co-owner or co-owners shall give to a delinquent co-owner or co-owners the notice in writing or notice by publication provided for in Section 2324 Revised Statutes of the United States, an affidavit of the person giving such notice, stating the time, place, manner of service, and by whom and upon whom such service was made, shall be attached to a true copy of such notice, and such notice and affidavit must be recorded in the office of the county recorder of the county in which the mining claim is situated; within ninety days after the giving of such notice, or if such notice is given by publication in a newspaper, there shall be attached to a printed copy of such notice an affidavit of the printer or his foreman or principal clerk of such paper, stating the date of the first, last and each insertion of such notice therein, and when and where the newspaper was published during that time, and the name of such newspaper. Such affidavit and notice shall be recorded as aforesaid within one hundred and eighty days after the first publication thereof. The original of such notice and affidavits, or a duly certified copy of the record thereof, shall be evidence that the delinquent mentioned in said Section 2324 has failed or refused to contribute his proportion of the expenditure required by that section and of the service or publication of said notice: *Provided*, The writing or affidavit hereinafter provided for is not of record. If such delinquent shall, within the ninety days required by Section 2324 aforesaid, contribute to his co-owner or co-owners his proportion of such expenditures, such co-owner or co-owners shall sign and deliver to the delinquent or delinquents a writing, stating that the delinquent or delinquents by name, has within the time required by Section 2324 of the Revised Statutes of the United States contributed his share for the year....., upon the..... mine, and further stating therein the district, county and State where the same is situate and the book and page where the location notice is recorded; such writing shall be recorded in the office of the county recorder of said county. If such co-owner or co-owners shall fail to sign and deliver such writing to the delinquent or delinquents within twenty days after such contribution, the co-owner or co-owners so failing as aforesaid shall be liable to a penalty of one hundred dollars, to be recovered by any person for the use of the delinquent or delinquents in any court of competent jurisdiction. If such co-owner or co-owners fail to deliver such writing within said twenty days, then the delinquent, with two disinterested persons having personal knowledge of such contribution, may make affidavit, setting forth in what manner, the amount of, to whom and upon what mine, such contribution was made. Such affidavit, or a record thereof in the office of the county recorder of the county in which said mine is situate, shall be *prima facie* evidence of such contribution.

SEC. 12. No notice of location of a lode claim shall claim more than one location, whether the location be made by one or several persons. And if such notice purport to claim more than one location it shall be absolutely void, except as to the first location therein described. And if they are described together, or so that it cannot be told which location is first described, the notice of location shall be void as to all.

SEC. 13. The locator of a placer claim shall locate his claim in the following manner: 1. By posting a notice of location thereon containing the name of the claim, the name of the locator or locators, the date of location and the number of feet or acres claimed. 2. By marking the boundaries of his claim with a post, tree or rock in place, or by setting a post or stone, one at each angle of the claim located. When a post is used it must be at least 4 inches square by 4 feet 6 inches in length, set 1 foot in the ground, with a mound of stone or earth 4 feet in

diameter, by 2 feet in height around the post. Where it is practically impossible on account of bedrock or precipitous ground to sink such posts, they may be placed in a pile of stones. When a stone is used, not rock in place, it must be at least 6 inches square and 18 inches in length, set two-thirds of its length in the ground, which tree, stake or monument must be so marked as to designate the corner of the claim located: *Provided*, That if the United States survey has been extended over said land then the claim may be taken by legal subdivision, and no other monument, except that upon which the location notice is posted, shall be required than the United States corners.

SEC. 14. The locator of any placer claim shall, within sixty days from the date of the location of a placer claim, record such claim in the office of the recorder of the county in which such claim is situated, which record must contain: (1) the name of the claim, designating it as a placer claim; (2) the name of the locator or locators; (3) the date of such location; (4) the number of feet or acres thus claimed; (5) a description of the claim, with reference to some natural object or permanent monument as will identify the claim. Any record of the location of a placer mining claim which shall not contain all the requirements named in this section shall be void.

SEC. 15. The proprietor of a vein or lode claim or mine, or the owner of a quartz mill or reduction works not owning a mine in connection therewith, may locate non-mineral land not contiguous to a vein or lode, but no locations hereafter made of such non-adjacent land shall exceed five acres.

SEC. 16. The locator of a mill site location shall locate his claim by posting a notice of location thereon, which must contain: (1) the name of the locator or locators; (2) the name of the vein or lode claim, or mine, of which he is the proprietor, or the name of the quartz mill or reduction works of which he is the owner; (3) the date of the location; (4) the number of feet or acres claimed; (5) a description of the claim by such reference to a natural object or permanent monument as shall identify the claim or mill site. And by marking the boundaries of his claim in the same manner as provided in this act for the marking of the boundaries of a placer mining claim, so far as the same may be applicable thereto.

SEC. 16. The locator of a mill site claim or location shall within thirty days from the date of his location record his location in the office of the county recorder of the county in which such location is situated, by a location certificate which must be similar in all respects to the one posted on the location.

SEC. 18. Any record of a mill site location which shall not contain the name of the locator or locators, the name of the vein or lode claim or mine of which the locator is the proprietor, or the name of the quartz mill or reduction works of which the locator is the owner, the number of feet or acres claimed, and such description as shall identify the claim with reasonable certainty, shall be void.

SEC. 19. The locator of a tunnel right or location shall locate his tunnel right or location by posting a notice of location at the face or point of commencement of the tunnel which must contain: 1. The name of the locator or locators. 2. The date of the location. 3. The proposed course or direction of the tunnel. 4. The height and width thereof. 5. The position and character of the boundary monuments. 6. A description of the tunnel by such reference to a natural object or permanent monument as shall identify the claim or tunnel right.

SEC. 20. The boundary lines of the tunnel shall be established by stakes or monuments placed along such lines at an interval of not less than 300 feet from the face or point of commencent of the tunnel to the terminus of 3000 feet therefrom. The stakes or monuments shall be of the same size and character as those provided for lode or placer claims in this act.

SEC. 21. The locator of a tunnel right or location shall within sixty days from the date of the location record his location in the office of the county recorder of the county in which such location is situated, which must be similar in all respects to the one posted on the location. Any record of a tunnel right or location which shall not contain all the requirements named in this section shall be void.

SEC. 22. All blind lodes, or veins or lodes not previously known to exist, discovered in a tunnel run for the development of a vein or lode, or for the discovery of mines, and within 3000 feet from the face of such tunnel, shall be located upon the surface and held in like manner as other lode claims under the provisions of this act.

SEC. 23. The provisions of this act shall be construed as equally applicable to all classes of locations except where the requirement as to any one class is manifestly inapplicable to any other class or classes.

SEC. 24. All acts or parts of acts in conflict with this act are hereby repealed.

Punishment for Removing Mining Monuments.

This bill is one more particulariy intended to protect the location stakes and monuments of a mining claim. It is an amendment to Section 605 of the Penal Code of this State and the changes are indicated by the words printed in italics:

AN ACT TO AMEND SECTION SIX HUNDRED AND FIVE OF THE PENAL CODE OF THE STATE OF CALIFORNIA RELATING TO THE REMOVING, DEFACING OR ALTERING LANDMARKS:

The people of the State of California, represented in Senate and Assembly, do enact as follows:

SECTION 1. Section six hundred and five of the penal code is hereby amended to read as follows:

Sec. 605. Every person who either:

(1) Maliciously removes any monument erected for the purpose of designating any point in the boundary of any lot or tract of land, *or defaces, removes, pulls down, injures or destroys any location stake, side post, corner post, landmark or monument or any other legal land boundary monument in this State, designating or intending to designate the location, boundary or name of any mining claim, lode or vein of mineral, mill site or tunnel right or location, or the name of the discoverer or locator or date of discovery or location thereof*, or a place where a subaqueous telegraph cable lies; or

(2) Maliciously defaces or alters the marks upon any such monument, *post or stake*; or

(3) Maliciously cuts down or removes, *injures or destroys* any tree upon which any such marks have been made for such purpose with intent to destroy such marks—

Is guilty of a misdemeanor.

Mine Robberies.

This bill is intended to amend an act concerning stealing from mines or mills. The changes are indicated by the words printed in italics:

AN ACT TO AMEND AN ACT ENTITLED "AN ACT SUPPLEMENTARY TO AN ACT ENTITLED 'AN ACT CONCERNING CRIMES AND PUNISHMENTS,'" PASSED APRIL 16, 1850, APPROVED MARCH 20, 1872.

The People of the State of California, represented in Senate and Assembly, do enact as follows:

SECTION 1. An act entitled "An act supplementary to an act entitled 'An act concerning crimes and punishments,'" passed April 16, 1850, approved March 20, 1872, is hereby amended to read as follows:

SECTION 1. Every person who shall feloniously steal, take, conceal, remove, or carry away from any *mine or* mining claim, tunnel, sluice, undercurrent, riffle box, sulphuret machine, *quartz mill, arrastra mill, chlorination or reduction works*, any gold dust, amalgam, quicksilver, or concentrates, *or the ore or mineral from any mine, ledge, lode, vein, or deposit*, the property of another, shall be deemed guilty of grand larceny, and upon conviction thereof shall be punished by imprisonment in the State Prison for any term of not less than one year nor more than fourteen years.

Mechanics' Lien Applied to Mines.

This bill is intended to amend the Mechanics' Lien law of this State in the interest of the working miner and to overcome the disadvantages he labors under through the Supreme Court's interpretation of the present law. The proposed changes are indicated by the words printed in italics:

AN ACT TO AMEND SECTION ONE THOUSAND ONE HUNDRED AND EIGHTY-THREE OF THE CODE OF CIVIL PROCEDURE OF THE STATE OF CALIFORNIA RELATING TO LIENS OF MECHANICS AND OTHERS UPON REAL PROPERTY.

The People of the State of California, represented in Senate and Assembly, do enact as follows:

SECTION 1. Section one thousand one hundred and eighty-three of the Code of Civil Procedure is hereby amended to read as follows:

SEC. 1183. Mechanics, material men, contractors, sub-contractors, artisans, architects, machinists, builders, miners, and all persons and laborers of every class performing labor upon or furnishing materials to be used in the construction, alteration, addition to, or repair, either in whole or in part, of any building, wharf, bridge, ditch, flume, aqueduct, reservoir site, canal, tunnel, fence, machinery, railroad, wagon road, or other structure, shall have a lien upon the property upon which they have bestowed labor or furnished materials, for the value of such labor done and materials furnished, whether at the instance of the owner or of any other person acting by his authority, or under him, as contractor or otherwise; *and any person who shall do work or furnish materials for the working or development of any mine, lode, mining claim, or deposit, or tunnel location yielding metals or minerals of any kind, or for the working or development of any such mine, lode, mining claim or deposit or tunnel location, in search of such metals or minerals; and all persons who shall do work or furnish materials upon any shaft, tunnel, incline, adit, drift or other excavation designed or used for the purpose of draining or working or developing any such mine, lode, mining claim or deposit, has a lien upon the same and the works owned and used by the owners for reducing the ore from any such mine, lode, mining claim or deposit; and all persons who shall do any work or furnish materials on or around or about any oil well or spring or petroleum field, either in building derricks, buildings, pipe line or any kind of machinery, or in boring or drilling, shall have a lien upon oil territory or petroleum field, whether designated as a placer claim or otherwise, upon which he labored or for which he furnished supplies, or the improvements thereon, whether the labor done or materials furnished were done or furnished at the instance of the owner of the building or other improvement, mine, lode, mining claim, deposit, or oil territory, or petroleum field, or his agent. And any person who shall do any work or furnish materials in or upon any mill site or structure thereon shall have a lien upon the same. And this chapter shall be so construed as to include in its provisions bridges, ditches, flumes, aqueducts to create hydraulic power works, reservoir sites, canals, lines or works or buildings for the generating, manufacturing or distributing of electric power for mining purposes, quartz mills, arrastra mills, concentrating or chlorination works, and all improvements in, on or about mines, lodes, mining claims, or deposits, or oil territory, or petroleum fields, or any mineral land whatever, whether or not such mines, lodes, mining claims, or deposits, or tunnel rights, or location, or oil territory or petroleum fields, be situated upon land classed or designated as mineral land or as non-mineral or agricultural land, or be held under an agricultural patent, or whether the title to such land is derived from the Mexican or Spanish Government;* and every contractor, sub-contractor, architect, builder, or other person having charge of any mining work of any character, or of the construction, alteration, addition to, or repair, either in whole or in part, of any building or other improvement, as aforesaid, shall be held to be the agent of the owner, for purposes of this chapter. In case of a contract for the work, between the reputed owner and his contractor, the lien shall extend to the entire contract price, and such contract shall operate as a lien in favor of all persons, except the contractor, to the extent of the whole contract price; and after all such liens are satisfied, then as a lien for any balance of the contract price in favor of the contractor. All such contracts shall be in writing when the amount agreed to be paid thereunder exceeds one thousand dollars and shall be subscribed by the parties thereto, and the said contract, or a memorandum thereof, setting forth the names of all the parties to the contract, a description of the property to be effected thereby, together with a statement of the general character of the work to be done, the total amount to be paid thereunder, and the amounts of all the partial payments, together with the times when such payments shall be due and payable, shall, before the work is commenced, be filed in the office of the county recorder of the county, or city and county, where the property is situated, who shall receive one dollar for such filing; otherwise they shall be wholly void, and no recovery shall be had thereon by either party thereto; and in such case, the labor done and materials furnished by all persons aforesaid, except the contractor, shall be deemed to have been done and furnished at the personal instance of the owner, and they shall have a lien for the value thereof.

What May Be Located as "Placers."

This bill is proposed for presentation to Congress to overcome the late ruling of the General Land Office in the case of Aldritt vs. N. P. R. R. Co., wherein it is held that only lands containing metalliferous ores not in place are subject to placer entry:

AN ACT TO AMEND SECTION TWO THOUSAND THREE HUNDRED AND TWENTY-NINE OF THE REVISED STATUTES RELATING TO PLACER CLAIMS.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled: That section two thousand three hundred and twenty-nine of the revised statutes be and the same is hereby amended as follows:

2329. Claims usually called "placers," including all forms of deposit of *metalliferous ores or earth*, excepting veins of quartz or other rock in place, *and including deposits of chalk, kaolin or fireclay, gypsum, petroleum oil, borax, carbonates and nitrates of soda, sulphur, alum, asphalt, limestone, mica, diamonds, or iron when not found in rock in place*, shall be subject to entry and patent under like circumstances and conditions, and upon similar proceedings, as are provided for vein or lode claims; but where the lands have been previously surveyed by the United States the entry in its exterior limits shall conform to the legal subdivision of the public lands.

Proposed Amendment to the Constitution as to Right of Eminent Domain.

The proposed amendment of Section 14 of Article I of the Constitution is taken bodily from the act of March 26, 1895, and is made necessary by the decisions of the Supreme Court of this State, that the Legislative declaration of public uses in which the right of eminent domain may be exercised is not conclusive in California and is open to review by the judicial department of the Government. The proposed amendment to the Constitution, if adopted, will insure the right to the miner and to others which the Legislature intends they shall have and

which, so far as the miner is concerned, is denied him by the Courts. The proposed amendment is contained in the sections numbered 1 to 13.

SENATE CONSTITUTIONAL AMENDMENT NO.—— TO PROPOSE TO THE PEOPLE OF THE STATE OF CALIFORNIA AN AMENDMENT TO THE CONSTITUTION OF THE STATE, AMENDING SECTION FOURTEEN OF ARTICLE ONE OF THE CONSTITUTION IN RELATION TO EMINENT DOMAIN.

Resolved by the Senate, the Assembly concurring:

That the Legislature of the State of California, at its regular session commencing on the 4th day of January, eighteen hundred and ninety-seven, two-thirds of all the members elected to each of the two houses voting in favor thereof, hereby propose that Section fourteen of Article one of the Constitution of the State of California be amended to read as follows:

SECTION 14. Private property shall not be taken or damaged for public use without just compensation having been first made to or paid unto the Court for the owner, and no right of way shall be appropriated for the use of any corporation other than municipal until full compensation therefor be first made in money or ascertained and paid into Court for the owner, irrespective of any benefit from any improvement proposed by such corporation, which compensation shall be ascertained by a jury, unless a jury be waived, as in other civil cases in a Court of record as shall be prescribed by law. This section shall be so construed as to include the following as public uses:

1. Fortifications, magazines, arsenals, navy yards, navy and army stations, lighthouses, range and beacon lights, coast surveys, and all other public uses authorized by the Government of the United States.

2. Public buildings and grounds for the use of the State.

3. Public buildings and grounds for the use of any county, incorporated city, or city and county, village, town or school districts; canals, aqueducts, reservoirs, tunnels, flumes, ditches or pipes for conducting or storing water for the use of the inhabitants of any county, incorporated city, or city and county, village, or town, or for draining any county, incorporated city, or city and county, village, or town; raising the banks of streams, removing obstructions therefrom and widening and deepening or straightening their channels; roads, streets and alleys, and all other public uses for the benefit of any county, incorporated city, or city and county, village, or town, or the inhabitants thereof, which may be authorized by the Legislature; but the mode of apportioning and collecting the costs of such improvements shall be such as may be provided in the statutes by which the same may be authorized.

4. Wharves, docks, piers, chutes, booms, ferries, bridges, toll-roads, by-roads, plank and turnpike roads; steam, electric and horse railroads; canals, ditches, dams, pondings, flumes, aqueducts and pipes for irrigation, public transportation, supplying mines and farming neighborhoods with water, and draining and reclaiming lands, and for floating logs and lumber on streams not navigable.

5. Roads, tunnels, ditches, flumes, pipes and dumping places for working mines; also outlets, natural or otherwise, for the flow, deposit or conduct of tailings or refuse matter from mines; also an occupancy in common by the owners or possessors of different mines of any place for the flow, deposit or conduct of tailings or refuse matter from their several mines.

6. By-roads leading from highways to residences, farms, mines, mills, factories, and buildings for operating machinery, or necessary to reach any property used for public purposes.

7. Telegraph lines.

8. Sewerage of any incorporated city, or city and county, or of any village or town, whether incorporated or unincorporated, or of any settlement consisting of not less than ten families, or of any public buildings belonging to the State, or to any college or university.

9. Roads for transportation by traction engines or locomotives.

10. Oil pipe-lines.

11. Roads for logging or lumbering purposes.

12. Canals, reservoirs, dams, ditches, flumes, aqueducts and pipes for supplying and storing water for the operation of machinery for the purpose of generating and transmitting electricity for the supplying of mines, quarries, railroads, tramways, mills, and factories with electrical power, and also for the supplying of electricity to light or heat mines, quarries, mills, factories, incorporated cities, cities and counties, villages, or towns, together with lands, buildings and all other improvements in or upon which to erect, install, place, use, or operate machinery for the purpose of generating and transmitting electricity for any of the purposes or uses above set forth.

13. Electric light lines.

A SUN DIAL made for London would be useless for either Paris or Edinburgh. The altitude of the pole star varies with the latitude, and hence is greater at Edinburgh, and less at Paris than at the polar star, the angle it makes with the dialplate must vary with the latitude.

Geologic Surveys of the Gold Belt of California.

Written for the MINING AND SCIENTIFIC PRESS by MARK B. KERR.

Every day and from many sources this inquiry is heard: "Why cannot detailed and reliable maps of the gold producing counties of California be obtained?" The folios recently published by the United States Geological Survey are very useful and valuable and are sold at a very reasonable rate to the general public.* But even these, although a great improvement over anything of the kind heretofore published, are not drawn on a scale sufficiently large to be of great economic value to the practical mining engineer when engaged in exploring and developing new areas and prospecting for gold-bearing veins.

The gold mining industry of California originally built up the prosperity of the State and stands today well in the lead of its resources. Prospecting in all the mining counties, and particularly in the "mother lode belt," is being vigorously and systematically pushed.

In thus opening up and prospecting new areas, a matter of primal importance is to obtain a good general topographic and geologic map. The county maps supply some information, the Geological Survey sheets a great deal more; but these are not sufficient for the growing needs of the progressive mining man.

If the Geological Survey would make their folios more detailed, the majority of those interested in mines would be willing, without doubt, to pay such a sum for the right kind of information as to warrant the cost to the Government of preparing them; and the sales made in this way could be credited upon the original appropriation in a much more important manner than the trifling sums at which the present maps are quoted at headquarters.

A thorough study of the "mother lode" would be of immense advantage at the present time, when so much prospecting is being done along its whole length. One area should not be preferred to another, but a good beginning must be made, and this lode today is decidedly more in evidence and is certainly of larger extent than most of the gold-bearing veins of the country.

A special and detailed map of this area, county by county, should be begun at once, and the delegates from Calaveras county have been instructed to bring the matter earnestly before the Mining Convention soon to assemble at San Francisco. When once this work is started, other parts of the gold belt can be taken up and material obtained of value to the miner.

The low-grade veins of the mother lode do not all come, by any means, to the surface. Shoots of ore are a mile and over apart, leaving valleys with no gold bearing veins between near the surface, but deep down. It is not unreasonable to suppose that as these shoots increase in width and length, in time they will join beneath the so-called barren valleys and eventually make continuous and profitable deep-level mines.

In the unexplored areas of Calaveras county, the largest portion of the lode is traversed by the Calaveras slates, forming approximately the hanging wall of the lode. The Mariposa or true black slates pertain to the upper Jurassic or lowest Cretaceous, and in this county form the foot-wall slates of the lode.

These slates once occupied the bottom of a vast and comparatively shallow sea, which extended to the base of the Plutonic mountains (now the Sierras). Gold was deposited in the quartz seams formed by evaporation in the fissures in these slates before and after upheaval. The plain or level of the top of these slate areas approximates at the present time the height of Jackson butte in Amador and Golden Gate hill in Calaveras, and can be stated at about 2000 feet above the sea. Gold also was deposited in the gravel channels flowing down from the old Plutonic mountains. A lava flow subsequently covered these gravel channels, extending to the edges and over the upraised slates. Erosion gradually lowered these ridges to their present position and height.

From this theory can be deduced an hypothesis that gold may be found in the mother lode veins as long as the black slates continue to go down. This has already been proved and exploited to be beyond 2000 feet. Assuming, therefore, the average past probable depth of the clays at the bottom of the old sea, and before upheaval to be about 2000 feet, a total depth of 4000 feet is reached, which may be roughly stated as the probable depth of the slates and gold-bearing quartz veins.

A geologic detailed study of this region, applied to practical mining development already done, would throw new light on these and many other important points, and its economic value is readily apparent.

A detailed topographic map on a large scale to accompany the geologic one in itself would be worth more than the cost of producing the whole work.

The Government in its economic work should not wait until a mining region is exhausted before making its definite reports, but should take up the new and undeveloped regions, and assist in exploring and making their value known to the outside public.

This matter, urged through proper representation at Washington, would go far towards obtaining sufficient appropriation for the work.

The Geological Survey from past experience, particularly in its report on the quicksilver deposits of the Pacific Slope, as well as work now actually being performed within the gold belt, is well equipped for such a study. If care is also taken to publish results with rapidity, the success of many prospects would be more safely assured, and a larger yearly output of gold would follow.

*Jackson folio and Smartsville folio sold by the U. S. G. S. at Washington for 25 cents.

Stamp Battery Development.

Is the stamp battery capable of further development? Apart from modifications of detail, there would seem only two directions in which development may be expected. The one is the better adaptation of the battery to dry crushing. The other is the introduction of variable adjustment, enabling one and the same battery to stamp any class of ore. In dry crushing by stamps one of the difficulties is that the discharge does not keep pace with the crushing. Unless there is instantaneous and thorough screening, the output is reduced; and, as the fines are ground still finer, while the larger pieces are in process of reduction, a perfectly uniform product is not obtained. Screening is sometimes accelerated by means of an exhaust, but attempts are now being made to supply intermittent blasts of compressed air, low down in the mortar, so as to get rid of the fines as quickly as they are formed. Unfortunately, none of these improvements can be effected without discounting a valuable advantage of the stamp battery—its simplicity.

As regards variable adjustment, or the capacity of altering at will the speed, drop and force of the blow, nothing, to the knowledge of the writer, has so far been done. No one set of stamps can at present deal in an equally efficient way with every class of ore. Batteries, therefore, range between the extreme slow stroke, long drop, light weight stamps, and those with heavy shoes, short drop, and rapid stroke. These variations are not arbitrary notions of manufacturers, but devices called into existence by actual requirements. For, though the object of crushing is one—namely, stripping the worthless gangue from the mineral, and, in most cases, the amalgamation of the latter, yet the method is necessarily manifold. One ore differs from another in its lithological, mineralogical, chemical and physical characteristics, and in consequence the most perfect separation and amalgamation demands battery work that may vary from slow crushing to rapid percussion. It is obvious that a friable, honey-combed quartz requires a different blow from a hard, tenacious rock. It will naturally be said that, when the ore at the mine is known, the stamp details can be suited to it, and no further adjustment is needed. But this does not apply to custom mills; nor does it strictly hold true of private mills. For the ore on any one mine is seldom constant; lodes change as the depth increases, fresh reefs are struck, etc., and the alteration in the mineral makes some change in the battery advisable, if perfect crushing is desired. The reply, of course, is that milling has to be not a theoretically but a commercially perfect process; and, if the speed drop, and blows are fairly well adapted to the ore, the acme of perfection is not worth the additional complication in the battery. This is a very reasonable and conclusive answer, so long as the inventor does not bring a satisfactory and practical retort in the form of a simple adjustable battery. Truly, it is not easy to see how this can be done. For practical reasons it is advisable to retain a division of the stamping units, as in the present gravity batteries. But the use of steam, pneumatic or hydraulic cylinders, with their accompanying valves, etc., for every stamp, would convert the battery into a complicated engine. Electricity furnishes apparently the easiest solution of the problem, as its application to the percussive rock drill is well understood, and could doubtless be utilized in an electric stamping battery, in which stroke, speed and impact would be easily capable of multiple adjustment. But, considering the rough conditions under which most batteries have to work, is the gain worth the complication introduced? Possibly not. Yet there is room for a crusher that shall have wider limitations than either stamps or rolls in the present form.—Capt. C. C. Longridge in the London Mining World.

Steal Other People's Inventions.

Just why inventive genius and gullibility should go together it is hard to say. Certain it is that inventors are the most guileless individuals in their dealings with others on business matters, and fall easy victims to the spiders who lie and wait for such flies. The list of clever men who walk to-day, while those who ride owe their luxury to the other man's genius and their own shrewdness, is an interesting

one. Here are a few cases picked haphazard from the chronicle of inventions that failed to benefit the inventor, or, at least, produced for him only a little of what was his due.

It is not necessary to be very old to remember when hooks were first put in men's shoes in place of holes, in order to save time in lacing the shoe at the top. This was the brilliant idea of an inventor to whom it should have brought a fortune. It would have done so had he been a shrewd business man. Being merely an inventor, he hadn't sense enough to keep his idea to himself until the patent office padlock had secured it against theft. In the innocence of his nature the inventor confided the idea to a friend while crossing the North river ferryboat, and the friend hardly waited for the boat to tie up in Jersey City before he excused himself, started back to New York, and went on a dead run for a patent lawyer in order to have the idea secured for his own especial benefit. Another man is known to-day as the inventor of the lace hooks. He owns a splendid house and is wealthy. The confiding inventor got nothing.

The inventor of a patent stopper for beer bottles, something that had long been wanted by the trade, sold the invention for $10,000 to a man who recognized its great money-making value. The purchaser is now worth $5,000,000, all of which he made from the sales of the patent stopper. Out of the goodness of his heart he presented the original owner of the patent with $30,000, so that the man got $40,000 in all for his $5,000,000 idea. To give some notion of the value of patent rights on this bottle stopper the price came down from $1 to 6 and 7 cents a gross, and even at this enormous reduction a good profit could be made.

The last inventor was treated with princely generosity, however, in comparison with a genius who devised a pocketbook clasp in the shape of interlocking horns, with balls at the end, which snapped shut with a single pressure. The idea was afterward applied to gloves and became very much in favor The inventor relinquished his prize for the magnificent reward of a kidney stew dinner and 50 cents, the latter having been advanced by the purchaser to pay the inventor's expenses from Newark to New York. The man who secured the idea and patented it, after treating the inventor in the royal manner mentioned, made a big fortune by his shrewdness. What became of the inventor is not known.

WILLIAM McKINLEY, PRESIDENT-ELECT OF THE UNITED STATES.

At a recent meeting of the Engineers' Club in Philadelphia, Mr. H. M. Chance described the application of electricity to the extraction of gold from the ores or materials with which it is associated. The processes described differ widely, both in method and principle, and were described as consisting of six classes, each involving a different principle or method of application. These classes are: (1) Electro-magnetic; (2) electro-solvent; (3) electro-amalgamating; (4) electro-precipitating; (5) electro-inductional; (6) electro-smelting. The first class employs electro-magnets to remove magnetic material from the gold with which it is associated or mixed. In the second class the current is used to assist in dissolving the gold from ores by means of chemical solvents of gold. In the third class the current is passed through the amalgamating plates or mercury to facilitate amalgamation. The processes of the fourth class are electrolytic, the gold being electrically deposited from its chemical solutions. These processes are extensively used in South Africa and to some extent in this country. The fifth method aims to remove gold particles from other materials by the inductive action of high-frequency alternating currents. The sixth method, that of electric smelting, promises well, provided the cost can be reduced to that of ordinary smelting processes.

The President-Elect.

William McKinley, President-elect of the United States, is a native citizen of Ohio, and is in his fifty-fourth year. His ancestry settled in America in 1724. Mr. McKinley's parents were plain folk, industrious and devout, and, while never in poverty, were so circumstanced that William—sixth in a family of nine sons and daughters—had to win his education by working out-of-hours and through vacation time. At seventeen he enlisted as a private soldier in the Twenty-third Ohio Volunteers, rising to second lieutenant and major. His war service was considerable and creditable. After the war he studied law, and in 1867 was admitted to the bar. He took an active part in local politics, and was chosen prosecuting attorney for the Canton, Ohio, district. In 1876 McKinley was elected to Congress, taking his seat in 1877. His recent political history as a Congressional leader, as chairman of the National Republican Convention of 1892, and as Governor of Ohio, is well known.

In 1871 Mr. McKinley was married to Miss Ida Sexton, daughter of a pioneer Ohio editor. Mrs. McKinley, who has for many years been an invalid, is said to be a woman of beautiful character and commands the absolute devotion of her husband. They have no children, a daughter born twenty years ago having died in early childhood.

Mr. McKinley has for many years been comparatively a poor man, having no income except his official salary and some small returns from legal practice. His savings from these sources, amounting to a few thousand dollars, were lost four years ago in a local bank failure. His style of living has always been of a modest kind. His home at Canton is a roomy but unpretentious cottage, and at Washington he has always lived at a hotel.

Laboratory Tests in Connection with the Extraction of Gold from Ores by the Cyanide Process.*

By H. Van F. Furman, Denver, Colo.

As the cyanide method for the extraction of gold from ores is extensively used in the United States and elsewhere, and appears destined to prove a factor of increasing importance in the metallurgy of gold, a description of the latest laboratory methods may prove of interest.

The history of the development of the process in the United States has been analogous to that of all new processes. Many failures are to be recorded and a few successes. It is the opinion of the writer that, had the following simple tests been better understood, many of the failures would not have occurred, and we should probably have a larger number of successful plants in operation. While the process is not simple, but requires a high degree of chemical and engineering skill, the determination of the adaptability of an ore to the method is generally not difficult. While the laboratory results will not always coincide with the actual results obtained in the mill, they will serve as a guide and control on the working of the mill, and will generally suffice to determine if the ore can be economically treated by the process. Objection may reasonably be made that in small tests conditions different from those which occur on a larger scale are introduced. However, tests made on from 25 to 100 pounds of ore should be closely duplicated in the mill. Tests on a smaller scale will serve to show what may be expected in the mill.

In determining the adaptability of an ore to this method of treatment, and the percentage of extraction which may be expected in the mill, the following must receive consideration:

The percentage of extraction will generally be somewhat higher in the laboratory than in the mill, but the consumption of cyanide will also be higher in the laboratory.

A most important point is the character of the ore, particularly the manner in which the gold is contained in it; whether it is in the free state; coarse or fine; intimately associated with pyrites or other sulphides; the character of the sulphides with which it is associated; whether it is combined or alloyed with bismuth, tellurium or other elements. An examination by the eye, with or without the aid of a magnifying glass, will frequently settle these points. Should the sample be in a finely pulverized condition, careful vanning may be resorted to with advantage.

The size to which it is advantageous to crush the ore will depend largely upon the character of the ore and its gangue. Should the gold be unevenly disseminated throughout the material, and the gangue be hard and non-porous, fine crushing is essential to a good extraction. The Cripple Creek ores are examples of such material, crushing to 40-mesh, or finer, being necessary to insure a good extraction of the gold. Some ores, however, being very porous, readily permit the solutions to percolate, and consequently can be successfully leached in a coarse condition. The Mercur ores are examples of such material, pieces one-half inch or more in diameter being successfully leached.

*Transactions Am. Inst. M. E., September, 1896.

(To Be Continued.)

Cripple Creek, Col., is said to have 9000 mining claims, just one-half of which are patented. This would represent nearly $500,000 of required assessment work in that one camp this year.

Mechanical Progress.

Interior Contour of Blast Furnaces.

The following is of practical value. Like the preceding article, "Hot Blast System for Copper-Matting and Silver-Lead Furnaces," which appeared on page 318 of the issue of Oct. 17th, it is from advance sheets of a catalogue of copper-matting and silver-lead smelting equipments to be published by the Colorado Iron Works Company, and now in press. It is written by Mr. John W. Nesmith, president of the company:

The diagram shown on this page is a graphic illustration of general interior contour of the silver-lead blast furnace now in general use, adaptable, by varying the proportions to suit the varying conditions involved, to all that general class of water jacketed rectangular furnaces for smelting ores for the recovery of their gold, silver, lead, copper, etc.

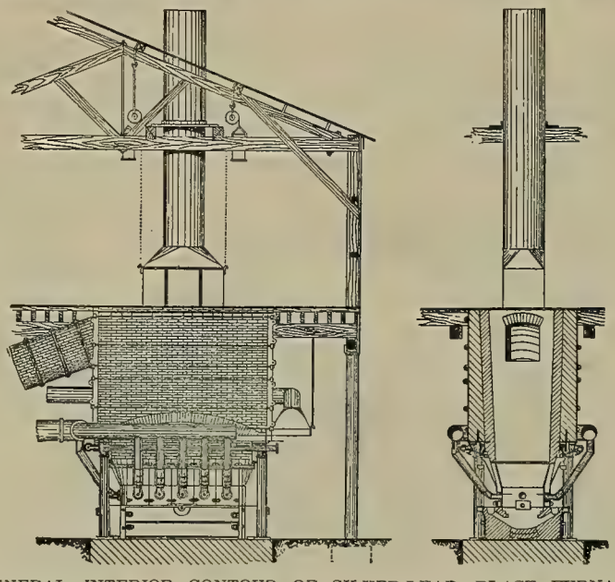
Much has been written and said about the adaptation of general interior contour to the conditions necessary for producing the end results desired, dividing the reactions in the material being smelted into the two general classes, oxidation and reduction. As a matter of fact, the general interior contour of a furnace adapted to produce these reactions is the same for both. It may vary in general proportions; it certainly does as to height, but as to the general trend of interior and wall lines the conditions are identical.

The reactions, whether reducing or oxidizing with carbon monoxide as the principal agent in the former, and oxygen in the latter case, take place to best advantage under similar conditions of temperature and exposure, and the boshed zone affords the best facilities for accomplishing either. With large proportional quantity of carbonaceous fuel burning in the melting zone and little or no free air passing through unconsumed, the atmosphere of the furnace becomes at once reducing as to certain conditions of the charge other than fuel, while with much excess of air blown into the melting zone and a proportionally small amount of CO being evolved, the characteristic of furnace reactions becomes more distinctively oxidizing as to the ore.

A straight furnace is simply a melting furnace, as a foundry cupola, and is adapted to melting pig iron or other product where a simple melting down of material without change in the groupings of its constituents is the object, while the duty of a smelting furnace is to produce such reactions as are necessary to change the grouping of the constituents of ore or other material operated upon, forming new combinations whereby the worthless is slagged away and the valuable concentrated; and as the evolved gases and oxygen are important factors in the smelting process, their distinctive reactions taking place to best advantage at temperatures ranging from dull red heat up to the final melting point of the material acted upon, and as time is a factor in the operation, more thorough exposure and time for their action than are afforded within straight walls are necessary to best results. Suitable proportions and characteristics of ore and fuel assumed in the charge, and volume and intensity of air blast into the hearth or tuyere zone determine the preponderance of the one or the other of these reactions, and it does not in the least interfere with or modify either the one or the other of them other than favorably if the furnace walls should be boshed outward at some point immediately above the melting zone; that is, at the incandescent zone where the preponderance of desired reaction of oxidation or reduction take place rapidly. Those reactions take place as well in a boshed zone as in a straight one, and by far better, in fact, for a given quantity of work done in a given time; that is, for a furnace of given duty, because boshing the furnace at the zone of incandescence next above the melting zone admits a proportionately greater quantity of ore in a given depth, or conversely a given quantity of ore for a greater length of time for exposure to the evolved gases or free air, or both, from the melting zone.

A copper furnace is a roaster to its top, and hence its efficiency in that regard, for all that part above the bosh is as the cross section area of that part to cross section area of hearth. For example: A hearth with cross section 10 feet by 3 = 30 square feet, and with 12-inch bosh of jacket section sides and ends area at top of bosh = 60 square feet. Thus double the amount of ore is constantly exposed to roasting action in all that part of the shaft between the top of bosh and top of shaft as would be exposed in a furnace with vertical walls, and has but to be supplied with the necessary oxygen to insure its proportionally increased efficiency, for in copper smelting the heat necessary to admit of the reaction is always there and escaping in the air. Boshing a furnace does not involve contraction of hearth. Proportion properly the hearth or tuyere zone section in its depth or height, its width, volume and pressure of air blast for the desired results, and they will be realized whether or not the walls are boshed above the melting zone, but more effectually if they are so boshed. At a melting temperature of say 2100° F. the air and evolved gases in the furnace have expanded to more than five times the original volume of the air supplied to the furnace by the blower. This with the blower pressure behind it, in a furnace with straight walls, causes a tremendous current upward to meet the ore in its rapid passage downward within the constricted limits of walls carried straight up from the hearth, allowing little time to any given piece or particle for exposure to the evolved gases or supplied air for their action upon it in their violent upward rush toward the top, which they quickly reach with small opportunity to have performed their appropriate functions in the reactions desired.

Of these intensely heated gases CO_2 is in considerable proportion where carbonaceous fuel is used, and so long as it carries sufficient heat to admit of the reaction is instant to give off an atom of its oxygen to glowing coke with which it comes in contact, evolving CO, which is ready again to burn on its first contact with oxygen in the presence of sufficient heat to admit of that reaction, and thus there is constant tendency to extension upward of the smelting zone. In a boshed furnace there is the opportunity for this immense volume of gases to expand laterally, and for equal volume a much less depth and wider area of ore is exposed for reactions and to take up their heat and decrease their velocity, and thus highest temperatures and their necessary reactions are kept proportionately lower down in the furnace.



GENERAL INTERIOR CONTOUR OF SILVER-LEAD BLAST FURNACE.

Straight walls afford an easy path for the gases with heat and flame to rush upward, carrying with them a great deal of dust and of the finest and lightest of the ores and calcines, while the heavier fine ores, as calcines, concentrates, etc., sift downward because the road is a straight one and because whatever coarse lumps of furnace material lie against the walls have greater proportional interstices around them on the wall side than such lumps of material have in the body of the furnace, where fines from all sides fall in and fill the vacancies. In a furnace having boshes these difficulties are much lessened or avoided altogether, for the bosh interposes a break in the open path which corrects the evils to a very great extent.

An important office of the bosh is its effect in keeping the furnace material freely open to permeation by the escaping gases. In a furnace with straight walls the whole weight of all furnace material rests on the bottom, sliding smoothly down with little friction as it melts away at the tuyeres, and the softened, half-melted mass at and near the tuyeres packs tightly, tending to obstruct the circulation of the air blast. In a furnace with boshed walls the boshes take the weight of that part outside of the vertical lines up from the hearth and hence cause friction on the column of ore within itself away from the walls directly above the hearth, reducing weight of ore column on the hearth and at the same time causing the ore to keep turning over and working within its mass, breaking up any aggregations of sintered material that may have formed above, and strongly counteracting the tendency there is to pack togeth r by reason of the fines filling all interstices and to become impermeable to the gases on their passage upward.

Whoever has operated lead furnaces having boshed sides and straight ends, and there are many of them, has noticed that the fire flames up the straight end walls much sooner and much more violently than up the boshed sides, and many metallurgists now insist on having the end walls as well as the sides built with bosh. And the angle of bosh has increased very much of late years, especially where there is much fines to smelt, some experienced furnace metallurgists requiring their water jacket sections made with 12 inches bosh in the. 30 inches next above the angle. Zinc crusts and other like accretions are as easily barred off a boshed section as off a straight one.

The bosh of a furnace is really thus an important factor in the smelting operation, and while it is possible to smelt ores in furnaces having no bosh, there are few cases where the bosh would not be an improvement, and it may fairly be said that such smelting is done in spite of the absence of that important factor, rather than better without it. The alleged smelting furnace having straight walls from hearth to tunnel hole, is on its way out and will directly be regarded as a relic of primitive methods.

In the case of iron furnaces gradual reduction of size from the upper part of the boshed section to the top is a logical conformation of proportions to the conditions, for the gases cool and contract in their course upward, giving off their heat to the body of ore in the stack and continuing to produce the appropriate reactions on their upward flow until a zone of dull red heat is reached and passed, above which point such reactions practically cease. In lead furnaces where it is essential to keep the velocity of escaping gases as low as possible, it may be the better practice to carry the walls up straight from the top of the boshed section, as is now the almost universal practice, in order that there shall be a continually proportional reducing velocity of the current of gases as it cools and contracts on its way out. There however is the disadvantage in this practice of always having a much greater quantity of ore and fuel in the furnace than there would be if the stack were reduced toward its top, so that when it is necessary to run down for any purpose or to change the proportions of charge in order to affect the running of the furnace, it takes a longer time to accomplish it proportionally as difference in area.

Gas Power on European Street Railways.

Gas street cars are being run this summer between Hirschberg, Warmbrunn and Hermsdorf, 8.4 miles; a line is to be run to connect Rudesheim with Biebrich, Wiesbaden, Cassel and Mayence, 27 miles; a line is in view for the suburban service of Hanover; a line at Colmar, probably; experiments are being made at Maestricht, Charlottenburg, Mannheim, St. Petersburg, Copenhagen, and will be made in eight other Continental towns. Paris is also experimenting on the Gas Traction Company's cars, with the following results: Horse power, 12 to 15; revolutions per minute, 100 to 250; volume of gas reservoirs, 44.2 cubic feet; initial pressure of gas, 10 atmospheres; volume stored, 442 cubic feet; water, 16½ gallons; number of passengers per car, 42; weight of car, empty, 7 tons; full, 10 tons; gas used per car mile, exclusive of gas used for compression, 31.1 cubic feet; maximum speed, 10 miles an hour; longest run without recharging, 14 miles. With gas at $1.13, this comes to 33 cents per mile run; and with establishment charges at $2\frac{7}{12}$ cents a mile and keep of cars at 2⅓ cents, this comes to 9 cents per car mile, as against 11¼ cents, the actual cost of electric car running in Paris.

THE improvement in marine steam engines and boilers is well shown by the following statement in the Liverpool *Journal of Commerce*: "Twenty-four years ago a firm of shipowners had a steamer built to carry 3200 tons dead weight. They have had one built this year to carry 8000 tons; and the coal consumption of the two vessels at the same speed is practically identical, though the latter vessel is 100 feet longer than the older one, but the fall in the rate of freights has been more rapid still.

A FEW experiments were made in this country and in France several years ago with compressed air for moving street cars. The idea was soon given up here, but it is in use in one or two cities abroad. For the past five weeks three cars equipped with suitable apparatus have been on trial on a short cross line in New York city.

Scientific Progress.

The Earth as a Magnet.

Dr. J. A. Fleming, F. R. S., in a lecture at Liverpool during the meeting of the British Association for the Advancement of Science on "The Earth as a Magnet," said that Columbus on his first voyage to America had made observations which showed that the declination of the needle is different at different places, and that there is in general a variation of the needle. Columbus appears to have crossed in this voyage the line of no variation on which the needle takes a true north and south direction. Burroughs' exact measurement of the variation in England in 1850, however, gave a starting point for the knowledge that the declination not only varies from place to place, but varies at the same place from year to year. The lecturer then pointed out by means of a number of charts and working models the general distribution of terrestrial magnetism. There are two poles of verticity, one in each hemisphere, where the dip needle stands vertical. These were closely attained by Sir James Ross in voyages to the Arctic region in 1831, and Antarctic regions in subsequent years. In addition to this there are in the northern hemisphere two places of maximum magnetic force called foci; and at least one, and perhaps two, foci in the southern hemisphere. This irregular distribution of magnetism precluded the idea that the earth acts as a single magnet. The poles of verticity do not coincide with the geometrical poles of the earth, nor do either of the foci coincide with the pole of verticity. The northern foci lie, one in the north of Canada and one in the north of Siberia.

The question of the nature and origin of terrestrial magnetism was considered. If the greater part of the earth's magnetism is due to the materials of which the earth is composed being permanently magnetized, then it is tolerably certain that this magnetic effect is wholly confined to a layer not much more than twelve miles thick. At that depth the rock material of the earth's crust is probably incandescent, or at least at a temperature of 800° C., and this is sufficient to destroy all magnetic quality in iron, magnetite, nickel or other magnetic bodies. On the other hand, we know that there are electric currents circulating in the crust of the globe, and a properly arranged flow of electric currents around the globe, flowing in the contrary direction to that in which the earth rotates, could be made to imitate the magnetic effect of the earth. These earth currents might exist at much lower levels than that at which any permanent magnetism of the material was possible.

Scientific Joking.

The dangers of "scientific joking" were never better exemplified than has recently been the case in the United States. D. Starr Jordan, president of Leland Stanford University, recently contributed an article to "Appleton's Popular Science Monthly," to which he gave title of "The Sympsychograph." This purported to be an exact account of the proceedings of the "Astral Camera Club" of Alcalde, California, whose members, by fixing their minds on the idea of a cat, succeeded in impressing that idea upon a sensitive photographic plate, and in thus obtaining a "thought photograph" of the animal. To add completeness to the "proceedings," the photograph of the "materialized thought" was reproduced in the body of the article. The "proceedings" as recorded were written in the customary serious vein usual to such records, but it is difficult to understand how any person could have read it without understanding that it was an elaborate "hoax," written ex-

pressly for "guying" many extraordinary accounts in the daily press of so-called "thought photography."

Our American contemporary, *Science*, and many daily newspapers, however, took the matter literally, and the former quoted the article extensively in the issue for 4th September. The following week's issue, however, contained an expression of regret that the comments should have appeared. It is undoubted that the "poking of fun" by such men as Mr. Jordan does considerable harm. Scientific men are, of course, not generally deceived by such a practice, but the daily press is always to the fore in "recording" any information of an "extraordinary" character, and no amount of subsequent contradiction will, in most cases, convince the general public that they have been hoaxed; in fact, it is very seldom that the daily press takes the trouble to publish a contradiction and an admission that it has been hoaxed. —Industries and Iron.

A THOUGHT-WEIGHING machine has been invented by Prof. Mosso, the Italian physiologist, the rush of blood to the head turning the scale. The machine is said to be so delicate that it can measure the difference in the exertion needed to read Greek from that required for Latin.

LUCIUM is the name of a new elementary body recently discovered by M. P. Barriere in the course of researches on the mineral monazite, which the discoverer proposes using for the production of an incandescent gas light. The atomic weight of lucium is calculated as 104.

Electrical Progress.

Proposed Changes in Ocean Cables.

It is now possible to talk with the aid of a telephone wire running overland with a person from 900 to 1000 miles distant. But at present no submarine cable in existence is adapted to telephony for more than fifteen or twenty miles. Probably the longest one in actual service is the one which reaches across the English channel, from Dover to Calais. Land lines may be connected with such a cable, though, so as to render conversation possible between points hundreds of miles apart. In telegraphing on a land line more than a hundred words a minute can easily be transmitted. But on the earlier ocean cables only about twenty or twenty-five words could be sent. On the best of them to-day the limit is about thirty or thirty-five. As each word contains five letters, on an average, and the electric current is broken and restored about three times to a letter, it will be seen that when the number of long and short impulses (or waves) exceeds 400 or 500 to the minute, they will not be distinct at the further end of an ocean cable long enough to reach across the Atlantic. But the vibrations of current excited in a wire by a human voice at a telephone are still more numerous, no matter how slowly one talks, and the clogging influence just mentioned blurs them into an indistinct murmur.

W. H. Preece, chief electrician of the British postal service, in a lecture before the British Association for the Advancement of Science, stated that he believes that the construction of a cable may be changed to reduce the trouble considerably. He proposes two changes: He would use paper instead of gutta-percha for the insulating material lying next to the metal, and then he would bring the conductors which carry the outgoing and return currents much closer together than ever before. For instance, the English channel cable has four separate round copper cores. Two are so connected with the other two as to serve as return wires. The distance between the members of a couple is a quarter of an inch or more, and the four wires are embedded in gutta-percha. Mr. Preece proposes to make the copper in his new cable half round, place two such wires together with only a thickness of paper between their flat faces, and then wind the pair with paper before putting on the outer coat of gutta-percha. One-half of such a core would be the return wire to the other half, and, consequently, four cores would permit four conversations at once, whereas the Channel cable allows only two.

Electric Industry in the United States.

In the electric lighting field the total capital invested in the United States is given as over $500,000,000. The number of plants, public and private, is over 10,000. The number of motors in use is estimated at about 500,000, and their value at about $100,000,000. The electrical apparatus used in mining is estimated at $100,000,000, and the value of the electric elevator industry will probably not fall short of $15,000,000.

The most important of all the electrical industries, however, is that of electric railways. In this field the investment is very great, and in the United States is represented by a capitalization of over $700,000,000. The number of trolley cars in use is said to be over 25,000, and these run on over 12,000 miles of track. The electric railways represent more than 90 per cent of all the street and suburban railroads of the country.

The aggregate of all the capital invested in electric lighting, electric railways and electric power is about $1,500,000,000, and this does not include the value of the establishments that manufacture the machinery and apparatus. As many of these are among the largest industrial enterprises in the world, and as nearly all are concerns of considerable magnitude, it is very evident that their combined capital will run up into large figures.

Inasmuch as the electric light and power industry represents an investment of about $1,500,000,000, without counting the value of the concerns that manufacture the machinery and supplies, it is evident that to estimate the total investment in every department of the electrical industry at $2,000,000,000 in the United States alone is not extravagant, for this would allow only $500,000,000 to cover the value of the telegraph, the telephone and the almost unlimited number of electrical manufactories, large and small, that can be found, from one end of the land to the other.—Cassier's Magazine.

THIRTY-NINE MILES an hour was made by a special car on the Akron, Bedford & Cleveland Electric Railroad, between Cuyahoga Falls and Newburg, Ohio, recently.

Practical Information.

Cleaning and Sharpening of Files.

Files and rasps used for working tin and lead can be cleaned and sharpened in the following manner: Dip the file for a few seconds into concentrated nitric acid until reddish brown vapors commence to ascend lively, then rinse in water, rub with a sharp brush and imbed the file in sawdust or coal dust, or dry it quickly for immediate use. A file clogged up by iron filings should be dipped into a watery solution of copper vitriol, by which the filings are dissolved and copper precipitated in the form of a slimy sediment, while the body of the file is attacked but little. Afterwards rinse the file in water, brush off, dip into nitric acid and conclude treatment as above. Files dulled by zinc filings are given a bath in diluted sulphuric acid, otherwise they are subjected to the same treatment. Clean all files used for working copper by means of nitric acid, but repeat the process several times, because the first time much copper is precipitated that adheres tenaciously to the body of the file. Files used for working wood are first put into hot concentrated sulphuric acid, rinsed, brushed, then dipped into lye of potash, rinsed and brushed again and finally dried. Drying can be accomplished best and quickest by pouring alcohol over the file and burning it off.—American Manufacturer.

THE British Consul at Iquique reports that great quantities of machinery of every sort, locomotives, boilers, tanks, are constantly required both for new works and for maintaining the old ones. The British manufacturers hold their own without difficulty. Their efforts to secure trade are worthy of success; they issue catalogues in the Spanish language, and, when possible, prices are affixed. Sterling prices are quite sufficient, the unit in this denomination being commonly used throughout Chile. In one department, however, we are often run out of the market, viz: in electrical machinery and appliances. The United States is able to turn out satisfactory work in this line, well finished and up-to-date, and it may be observed *en passant* that the commercial travelers representing the hugely capitalized companies in the States seem to have more push and to be more active than their English confreres.—London Machinery.

IT is probable that within a few weeks the future of one of the most neglected but one of the most promising of British colonies will be finally settled, says *Industries and Iron*. In British Guiana we have a region which is perhaps one of the richest mineral areas in the world. It is intersected with waterways, more or less navigable, whilst the Barima river offers a main water course on which the country may be penetrated to a considerable distance by vessels of large displacement. Doubtless the first step which will be taken as soon as the settlement is arrived at will be the construction of the Barima railway, which has already been partly surveyed. A considerable number of mining properties, too, are being steadily developed, and we may soon look upon British Guiana as an opening for plant and machinery that is likely to vie with South Africa itself.

A CURIOUS METHOD of producing platinum is practiced by the inhabitants of the villages on the Tura river in the Russian Government district of Tomsk in Siberia. They call this method "plowing the water." A raft is constructed and an inclining gutter of boards fastened to it, which at its lower end is provided with an iron plow. While floating down the river they scrape and plow its bottom. The sand scraped out falls into the gutter and passes into a tub filled with pine boughs, upon which the platinum is deposited. The sand of the Tura river and its tributaries is so rich in platinum, and its primitive production so profitable, that the peasants are abandoning agriculture and devoting themselves to "plowing the water."

THE automatic machine idea has been turned to new account in Italy. Put a coin in the slot and take out a receipt and the thing is done. The workingman's "honest penny" is banked without the trouble of going to a savings bank or postoffice. When a sufficient number of receipts have been collected they can be exchanged for a "libretto" at the regular savings bank. Interest at 4 per cent is paid on deposit, and the depositors are entitled to a share of the profits derived from the bank's operations.

THE moment that a young crocodile breaks its shell it is to all intents and purposes as active as it is at any time during life. It will make straight for the water, even if it be out of sight and a good distance off, and it will pursue its prey with eagerness and agility during the first hour of its free existence.

PROF. FHELTOHUE says that if we reckon the depth of all oceans at an average of three miles there would be a layer of salt 200 feet thick in their basins, should the waters of all suddenly evaporate.

INVENTORS, Take Notice!
L. PETERSON, MODEL MAKER,
226 MARKET ST., N. E. Corner Front (Up Stairs), SAN FRANCISCO. Experimental machinery and all kinds of models. Tin and brasswork All communications *strictly confidential.*

WILL NEGOTIATE with owners or their duly authorized agents only.
WILL INVESTIGATE only thoroughly bonafide properties, either Mines, Prospects or Mineral Lands, whose owners are willing to make reasonable terms. When sending reports on properties also send terms on which you are willing to sell or lease.

FOR SALE.
Gold Mining Property,
Situated in the Silver Peak and Red Mountain Mining District, Esmeralda County, Nevada, the property of James O'Hale, deceased, comprising three claims well developed, mill site and spring, 2-stamp mill, engine (6 H. P.) and boiler, complete set of tanks and all requisites for cyanide process, mining tools, horse and wagon, two sets of harness, comfortable house—all to be sold as a going concern. Offers will be received by STAFFORD O'NEILL, postoffice address Silver Peak, Esmeralda County, Nevada.

WANTED,
A position as Superintendent or Assistant Superintendent in copper-silver or silver-lead smelting works.
Understands mining, sampling, assaying, furnace management, handling men.
Prefer Mexico or Spanish South America. Speaks Spanish. Best references.
Address METALLURGIST this office

THE CALIFORNIA DEBRIS COMMISSION, having received application to mine by the hyraulic process from William Konradi, in the Blackwater Claim, near Spanish Ranch, Plumas Co., to deposit tailings behind the Quincy Mining & Water Company's impounding works in Spanish Creek; from Walter Shackleford, in the Grub Flat Mine, No. 2, near Meadow Valley, Plumas Co., to deposit tailings in Reservoir Ravine; from Pitro Picolo and Luigi Sobrero, in the Cleveland Placer Mine, near Johnsville, Plumas Co., to deposit tailings in a ravine below the mine; from Francis Jackson in the Sebastapol Flat Claim, near Spanish Ranch, Plumas Co., to deposit tailings in an old pit; from La Mont Brown, in the Preacher's Ravine Placer Mine, near Scales, Sierra Co., to deposit tailings in Preacher's Ravine; from F. B. Clark, in the Clark and Willis Mine, near Railroad Flat, Calaveras Co., to deposit tailings in a ravine below the mine; from Charles Edner, in the Lady Edner Mine, near Omo Ranch, El Dorado Co., to deposit tailings in a ravine below the mine; from Em Santirfo, in the Santa Clara Mine, near Volcano, Amador Co., to deposit tailings in South Branch of Sutter Creek; and from Eckart & Solario, in the Campi Placer Mine, near Volcano, Amador Co., to deposit tailings in a ravine below the mine, gives notice that a meeting will be held at room 59, Flood Building, San Francisco, Cal., on November 16, 1896, at 1:30 P.M.

IMPROVED MINERS' LANTERN.
A light, simple, cheap and efficient Lantern which will remain lighted in the strongest drafts. County or State rights for sale on royalty. MRS. HATTIE DELZELL, Jackson, Cal.

Mining Summary.

CALIFORNIA.

Amador.

Record: The shaft in the Gwin mine is down 1420 feet. The 1200 and 1300 foot levels show ore bodies 10 to 14 feet thick. The mill work will start December 1st.

The San Francisco men who purchased the Allen and adjoining quartz properties at this place have let the contract for a 40-stamp mill, and several men who are to be employed upon the construction have already arrived. A temporary hoisting plant is to be put in, as it has been decided to replace it with electric power from the Blue Lakes plant as soon as that is completed.

At the Pocahontas mine in Drytown district the shaft is down 90 feet and in the crosscut four ledges have already been encountered. The last one struck is 23 feet wide and prospects well.

At the Bay State mine in Plymouth district the 10-stamp mill is running regularly on good rock from the 700-level, where drifting and stoping is in progress. On the 300-level a crosscut is being run for the west ledge. It is in about 50 feet and they expect to encounter the vein in about 300 feet.

Ledger: Clark and Madden are about to let a contract for driving a tunnel 300 feet on the Mokelumne river near the Madden home.

The power was turned on the 10-stamp mill at the Red Hill mine last week to test the running of the machinery. Five stamps will be put in operation by the 1st and the other five a week later.

James E. Dye, the general manager of the Jackson Exploration and Development Company, has received instructions by cablegram to go ahead at once and sink the shaft of the Amador Queen Mine No. 1 to a depth of 1000 feet.

Ledger: The Venus mine at Campo Seco, which has been idle for some time, has been reopened by a Chicago man, Mr. Leszinsky, who has sunk a 2-compartment shaft a depth of 100 feet. Good ore was discovered at 80 feet.

Dispatch: Read, Boyer and Tonzi are about to start work on the Full Moon Mining claim about five miles below Sutter Creek. The property contains a large talc ledge which carries considerable gold. A number of parties heretofore have tried to work the talc, but could not make it a success.

Republican: At the Good Hope mine the 10-stamp mill is nearing completion.

The Reward Mining Company is adding five more stamps to their mill.

The Dane mine is being put in running order.

The company at the White mine on the Dennis Kelly ranch is putting up some heavier hoisting machinery.

Butte.

Oroville *Register*: J. Champion of the Red Point mine at Enterprise has run a tunnel a distance of 300 feet. Lately he let a contract to run another 100 feet and expects to tap the ledge at a depth of over 300 feet. He has recently erected two buildings at the mine and is getting everything in good shape for the winter season.

Frank Elliott has engaged a company to work his mine at Swede's Flat, and will begin shortly.

Mercury: T. L. Vintin has increased the force in his mine at Cherokee to thirty men, and work is progressing rapidly.

Calaveras.

Citizen: The Encino mill at Chile Gulch has started up and it is reported that some rich gravel is being crushed.

Preparations are being made to begin work at the Meinicke gravel mine, near Vallecito as soon as the winter rains begin. A reservoir is being built and thirteen men are preparing for hydraulicking.

James Gleason of Central Hill is negotiating a bond on the gravel channel embracing the properties of Pfortner, Burns, Salcido and Swenson. The deal will be consummated within a week and work will be commenced on the property immediately. Mr. Gleason represents Messrs. Snedigar, Sullivan and other San Francisco capitalists.

Articles of incorporation have been filed at Stockton by the Lightner Mining Company to work the Lightner gold mine, situated in Angels Camp, on the Utica and Stickles vein. This property belongs to the Eastland estate.

The new 4-stamp mill on the Blue Bell mine, near Glencoe, is almost completed, and the stamps are now dropping.

Chronicle: Active operations have been resumed at the Del Ray mine at Middle Bar.

Sinking is soon to be commenced on the Thorpe mine. The shaft will probably be sunk between 200 and 300 feet deeper before the construction of the mill is commenced.

El Dorado.

Republican: At the Burton mine, the south extension of the St. Lawrence, near Kelsey, the new owners are putting up a steam hoist with a capacity to sink 500 feet. They have a ledge from 4 to 8 feet wide on which a shaft has been sunk to a depth of 160 feet.

An undivided one-half in the Boulder Hill placer mine was recently sold by Stevenson & McKinney to Hungerford & Rouse of Antioch. The new owners are working together to develop the property, and they are reopening the old Steele ditch to get water from the head of Ringgold creek.

Kern.

A five weeks' run of one mill on Rand ore netted $21,000. The other mills are running night and day, and work is in progress in the construction of two more mills. Great quantities of ore are piled up, waiting to be worked. A cyanide process mill is also to be erected at once.

There are some very good mines in the district, but for want of water for milling, they labor under a great disadvantage. The ore is hauled twelve and twenty-six miles to mills, and it costs $10 to $15 per ton for working. Ore not yielding $40 does not pay to mill. Randsburg district contains a population of about 500. There are very few wooden buildings. There is no lumber in camp. People do business in tents of various sizes. Lumber, when there is any, is $40 per thousand rough. Hay sells for $25 per ton; barley, $1.40 per sack; water is hauled six miles from a well and costs 4 cents per gallon delivered.

Nevada.

Union: At the Orleans they have struck a stringer of fine ore in the 700 level which promises to develop well. It shows considerable free gold. This is the first gold-bearing ore discovered below the 200-foot level.

At the Electric mine Supt. Coffin has a good 18-inch ledge.

Telegraph: At the Pennsylvania mine on the 600-foot level a 2-foot ledge with considerable sulphurets and carrying free gold has been encountered.

Placer.

The hoisting works at the Gray Eagle mine, near Butcher Ranch, have been destroyed by fire. Work will be continued through the tunnel as heretofore.

Plumas.

(Special Correspondence).—Times are lively about Slate creek. The Garnett Company (formerly Bunker Hill and North American) are working a large number of men and making money.

The Thistle shaft keeps now 125 men active, and many drift mines are in operation between Bunker Hill and La Porte, a distance of eleven miles, while in the bed of Slate creek about 300 men are busily and profitably employed working tailings. Among them the Alturas Company (Hendel & Packer) are undoubtedly doing the best work and reaping the largest benefits from their energy and practical working methods. It is a fact that, while the English company operating extensively in Slate creek two years ago failed of success after a large expenditure, individual miners are now reaping a rich harvest with the simplest of appliances, as sub-leasers of the same ground. And yet there is abundant room for the application of capital, joined with judgment and experience, to the gravel deposits of this region.

La Porte, Nov. 3rd, '96.

In the North Fork country E. E. Ross, in his mine on Marion creek, has completed a large restraining dam and will do some heavy piping next summer.

It is livelier on that part of the river than it has been for thirty years.

J. F. Cummings of the Sunnyside mine has just put on a full force, and they are taking out from 50 to 60 cars per day.

The two mining companies known as the Golden Ancient Channel and the Yellow Jacket have been consolidated and incorporated with the following officers: President, Rufus Fisk; vice-president, Guy H. Salisbury; secretary, J. M. Haskins. Directors—Rufus Fisk, Guy H. Salisbury, J. M. Haskins, F. J. Smith, T. A. Rogers, Perry C. Smith. The capital stock is $100,000. The company is preparing to operate the mine on a large scale next spring. The shaft is down 160 feet. The company will put in a pump and other machinery to explore the channel thoroughly.

National Bulletin: Capt. C. E. Gillette of the California Debris Commission has visited and accepted the new restraining dam erected by the Quincy Mining and Water Co. across Spanish creek. This dam is the largest in that part of the State. It is 130 feet long at the base, 300 feet long at the crest and 30 feet high in the central part. It is a log crib structure, the bottom logs bolted to the bedrock, three tons of rods having been used for this purpose. This dam will hold debris on an area of 60 acres above it and enable the company to operate the mine for two years. The dam at Wauponsee creek is being raised.

Capt. Gillette, accompanied by A. W. Keddie, C. E., also visited and examined several other Plumas mines, with the view of granting permits to erect restraining dams, etc., among them the Gumbert mine at the head of Poplar creek, the Shackelford and the Shackelford & Brown mines at Meadow Valley, the Leek mine on Rush creek, the Taylor Diggings properties between Genesee and the North Arm and the Ross mine on the North Fork. It is evident that, with the opening of the water season, numerous Plumas county mines will begin operating.

Sacramento.

Large quantities of lumber and machinery are being hauled to the scene of operation of the River Bedrock Mining Company, at the mouth of Alder creek, about three miles from Folsom.

San Bernardino.

San Bernardino *Sun*: Harrison & Willard have shipped to their mines near the Kern county line, in the Randsburg and Goler district, a load of lumber and equipment for a 10-stamp mill, which will be put up at Cuddeback's Dry lake, where a sufficient flow of water to supply ten to twenty stamps has already been developed. The mill site is fourteen miles from Randsburg, in this county. They will do custom work for such of the miners of the Randsburg, Fremont Peak and Goler sections as wish to haul their ore to the new mill.

San Diego.

The statement of the Golden Cross mines from August 15 to October 15th shows the bullion product from the mill to be $45,349; total receipts, $48,445; disbursements, $37,091, of which $20,059 was paid for labor. In the Cross mine on this property a 16-foot ledge of fine ore has been developed. The ledge has been opened for 60 feet, showing enough ore in sight to keep 100 stamps busy for at least six months. In the Crown mine a ledge of high-grade ore has been opened. The receiver of the Golden Cross properties thinks he can soon apply $20,000 monthly toward the payment of the debts of the company.

Escondido gold mines cleaned up $4000 in seven days' run.

Shasta.

Free Press: Dale & Duncan, owners of the Star of Hope mine near Churntown, are shipping ore from their mine to the smelter at Keswick for reduction. The ore is taken from a well-defined ledge 2 feet in width, and which has been crosscut at a depth of 70 feet.

John Wright has bonded his mining property in the Spring Creek district to Kahny & Burgbacher for $1000.

Sierra.

Messenger: Mr. Copeland has now about thirty-five men employed at his two properties in Slug Canyon.

Enterprise: Twenty men are employed at the North Fork claim at Forest City, and preparations are being made to more extensively develop that extensive mining property.

Messenger: There are thirty-three men at work on the Copeland-York mine, in Slug canyon. The two tunnels on the ledge are being retimbered and driven ahead. Pack trains are delivering lumber on the property, to be used in putting up buildings for the winter.

The Mabel Mertz Mining Company, composed of Forest capitalists, are running a tunnel to tap the old Nebraska lead. The tunnel is now in 350 feet, and a fine body of gravel has been struck.

At the Van Clief mine, the Prospect Mining Company have five men at work driving the tunnel ahead.

Siskiyou.

Yreka *Journal*: The owners of the Garrett mine, below the mouth of Scott river, at Hamburg bar, are reported to have struck very rich ground, about $500 having been taken out to the bucket.

The Distlehorst & Barton Dredging Company are working their dredger at Buckeye Bar, and are now taking out good pay gravel. The large boat is anchored close to the shore, and the heavy machinery is run by a 25-horse power engine. The large scoop plunges down between the boats, bringing up about a ton of earth, and the gravel is raised and dumped into a large shaker, which sifts all the sand and fine gravel into the sluices, while the boulders pass off through a chute into the river.

Journal: The owners of the Gardner mine at Oro Fino will be enabled to start up soon, as it does not require as large an amount of water as the other hydraulic claims around Oro Fino. The Eastlick Bros. and Wright & Fletcher mines are never worked a great deal until along the first of the year, when the owners put large forces of men at work and are kept busy until fall.

The Erno mill is nearly completed at Muginsville, and it is expected it will be ready for operation early this month.

The Spengler Bros., at the mouth of Humbug creek, Klamath river, are now able to commence work on an extensive scale, as the late rain storms furnished a good supply of water, besides snow on the high mountain peaks to keep it up until the regular winter storms begin.

Trinity.

Redding *Free Press*: A consignment of 17 tons of sulphurets has been sent to the Selby Smelting Works from the Brown Bear mine.

Hundreds of thousands of dollars are being expended in the development and equipment of the great hydraulic mines of Trinity county. The latest improved and most expensive machinery is being put in. A lot of patent iron water gates of very large size are now lying at the freight depot here consigned to the C. F. D. P. Hydraulic Mining Company at Junction City, Trinity county.

Tuolumne.

Union-Democrat: The Golden Rule shaft will soon be down to the 600 and drifting on the ledge will then commence.

Everything at the Marlowe is about ready to start up since the recent rain.

At the Jumper a new three-compartment shaft will be sunk on the ground dividing the New Era and Jumper ground. It will be one of the best pieces of work on the lode outside of Coulterville, where the Merced Company sank three shafts of the same character. The old incline on the New Era is being overhauled and will be used until the new shaft is ready. The contemplated improvements will cost $40,000.

At the App, owing to a scarcity of water, the mill has been closed down for a time. There is enough water to continue operating the hoist and keep the mine dry.

At the Belleview the big pump, which is one of the largest in the county, is being placed in position. Supt. McDonald is anxious to begin stoping right away and is rushing the work.

At the Dutch the new gallows frame has been erected. The mill is kept crushing on rock that was mined and stored some time back. A well equipped machine shop has been added to the plant.

NEVADA.

LINCOLN COUNTY.

(Special Correspondence).—The Dolly Gold Mining Co. has suspended operations on account of the withdrawal of L. E. and H. L. Van Winkle of San Francisco from the company.

Dan Murphy of the Needles firm of Monaghan & Murphy recently passed through this place in company with a representative of an English syndicate, who had been experting the Capital group of mines, with a view to purchasing the same.

W. C. Wallace of San Francisco is now in London seeking capital for the development of his mines, located in this district. He is expected to return soon and to begin extensive operations.

Since the death of W. S. Mills, the former manager of the Southwestern Mining Co.'s mines, that company's affairs have been at a standstill. It is learned, however, that Chas. Gracey of Amador county, Cal., has been appointed manager, and is now engaged in paying off the back indebtedness and adjusting matters preparatory to a new start. Mr. Gracey will, after spending a few weeks in California, attending to business of a personal nature, engage in prospecting the company's property, consisting of a group of several mines, situated in El Dorado Canyon. These mines were formerly worked for gold and silver, but in future will be worked for free gold alone.

El Dorado Canyon, Nev., Oct. 26th, '96.

Silver State: One hundred men and fifty teams have gone into the Island mountain country, Elko county, where work will be vigorously pushed all fall, so that operations will begin in the spring. The company has 5000 acres of valuable placer ground. A few days since a rich strike of gold ore was made in Tennessee gulch. The ledge is large and displays immense quantities of free gold.

Pioche *Record*: Encouraging reports come from the Sunrise mine. The tunnel is now in about 345 feet. At present it would be a good one if the owners had a plant to reduce the ores.

Ely *News*: Commencement of work has been made on the Star and Gray Eagle mines, near Cherry creek, through the efforts of A. C. Cleveland.

Belmont *Courier*: The gold mines in western Nye are yielding rich ore, and the mills are turning out bullion regularly.

OREGON.

Baker City *Bedrock-Democrat*: The termination of the Virtue mine suit will be the means of adding new life to the camp. The Virtue is one of the oldest mines in this section, and under the ownership of Geo. W. Grayson has always been known as a good producer.

The placer mining season is drawing to a close. The output has exceeded all expectations, and indications point to an increased output next season. Our placers are a great source of wealth to Baker City.

Wm. White, Jr., of Pittsburg, Pa., a representative of a company of Eastern capitalists, is inspecting a number of mining properties near Baker City.

The hills around the Virtue district are full of prospectors and mining men, and the camp presents a very lively appearance.

At Cornucopia, in the Union-Companion mine, a good-looking ledge has been exposed in the 1000-foot level. An electric light plant furnishes light for both the mill and mine. The company is now putting in a 275-horse power engine and boiler, an air compressor and two rock drills. The capacity of the milling plant is about 50 tons per day.

The Red Boy has over two miles of development work. The mine is closed down at present, pending the result of the O. G. M. Co.'s suit.

The White Eleghant shows a strong four-foot ledge, the ore running from $3 to $8 in free gold, and from $120 to $140 in concentrates.

Grant's Pass *Observer*: Taylor & Crow, who have a quartz mine on Lost Flat, near Galice creek, have received returns from 12 tons of ore which averaged $125 per ton, and the ledge is 36 inches wide and getting richer as depth is reached.

George B. Ward, who is interested in mining property on the Illinois, has shipped a large lot of supplies of pipe, giants and general implements for mining. They expect to be ready for work as soon as water comes.

BRITISH COLUMBIA.

The customs returns for the year so far from the port of Nelson are as follows:

	Gold—		Silver—	
	Ozs.	*Value.*	*Ozs.*	*Value.*
Quarter ending—				
Mar. 31	5,702	$102,644	706,605	$ 469,815
June 30	5,749	104,484	407,081	270,585
Sept. 30	14,901	268,215	529,422	355,824
Total	26,352	$475,343	1,643,108	$1,096,224

	Copper—		Lead—	
	Tons.	*Value.*	*Tons.*	*Value.*
Quarter ending—				
Mar. 31	282.2	$ 35,474	2181.9	$ 70,887
June 30	542.4	59,814	1153.4	33,784
Sept. 30	559.8	67,773	1525.0	38,723
Total	1383.6	$163,061	5062.3	143,394

SUMMARY.

Gold	475,343
Silver	1,096,224
Copper	163,061
Lead	143,394
Total	1,878,022

To this must be added about $500,000 for the Slocan ore which has been sent out by way of Nakusp and Revelstoke and does not pass through the port at Nelson. This brings Kootenay's exports for 1896 up to the end of September to $2,378,022.

Eighty new mineral locations were recorded in Nelson last week.

W. A. Carlyle, the provincial mineralogist, has completed his work in the Slocan and returned to Victoria.

The Royal Gold Mining Company, with headquarters at Spokane, has been incorporated with $3,000,000 capital stock.

L. M. Davenport and others, representing Eastern parties, have purchased one-half of the Deer Trail No. 2, in the Cedar canyon district, near Davenport, for $30,000. The property is well known and has produced a large amount of high-grade silver ore. Seventy-six thousand dollars' worth of ore has been marketed this year and $40,000 in dividends have been paid.

One-half in the St. Keverne group of mines

in the Slocan has been bonded to California parties for $10,000.

ALASKA.

The last annual report of the Alaska Mexican Gold Mining Company is a good record of mill management: Number of stamps, 60; weight, 1020 pounds. Drops per minute, 97; height of drop, 7¼ to 8¼ inches. Total tons crushed, 79,439 of 2000 pounds. Tons of concentrates produced, 1597. Total time lost in twelve months, 5 days 16 hours; of this, time taken for clean-ups, 2 days 12 hours. Actual lost time from other causes, 3 days 4 hours. The duty of the stamps was 3.68 tons per 24 hours of running time, the ore being hard quartz and the screen 40-mesh. The total cost of milling, inclusive of the chlorination of sulphurets, was 45 cents per ton of 2000 pounds. This includes machinery of every description, costs of repairs and renewals of machinery. The mill was operated 207 days by water power and 152 days by steam power.

H. V. Burner, a San Francisco mining expert, acting for California parties, has bonded William Milmore's mining claims near Sitka for $15,000.

News: The Eastern syndicate which purchased the Alaska-Willoughby mines will shortly begin extensive development work. A two-compartment shaft will be sunk to a depth of 250 feet, 200 feet below the drainage level, and at intervals of 100 feet levels will be run to connect with the shaft. New hoisting works will be put in, and as soon as sufficient ore is blocked out the mill will be increased to thirty stamps, as was the original intention of the old company. Work on the King group will be carried on simultaneously with that on the claims on the beach, one of the first improvements to be made being the construction of the narrow-gauge road connecting the upper claims with the mill.

The Apollo Company have on their payrolls 175 men. Two new engines have been installed—one to drive the compressor and one of 125-horse power, of the Corliss pattern, to run the mill. The new three-compartment shaft is now down 100 feet, and work has been commenced on the station to run a crosscut for the ledge. The mill is averaging between $35,000 and $40,000 a month.

A crew of men has begun operations on the Sitka mine.

Considerable prospecting has been done this season on Kodiak, Afognak and Whale islands. On the latter island J. J. Bannan has struck a two-foot ledge of free milling quartz which assays well.

UTAH.

Salt Lake *Tribune*: At the Golden Gate in Mercur it has been variously estimated there is in sight from five to seven million dollars in gold ore, and it is asserted that assays have been made showing as high as $200, and that the average value is between $15 and $20. Yet it is unknown when this company will build a mill.

At the Sacramento, with their mill enlarged, they are now handling a daily output of 100 tons, some running as high as $20 per ton, and giving an average of $8 per ton.

The reduction of the cyanides by the Marion Company will soon be a settled fact, as experiments have demonstrated that they can do as good work, and do it as cheaply, as any of the Eastern concerns. It is the intention of the company to establish a custom refinery to handle all the cyanides in the district.

The Gold Dust has found a vein 20 feet in thickness and carrying good values, and enough development work has been done to show that the property is of sufficient value to justify the expense of a mill.

IDAHO.

Spokesman-Review: The Poorman-Tiger, at Burke, is constantly lowering the water in the shaft. Considerable trouble was experienced shortly after the new hoist was put in, and for a while the water rose in the shaft. There is now about 600 feet to take out.

The leasers on the Galena expect to commence work about the first of next month.

The Yosemite, at Murray, is again running full time, the mill having only been running a day shift. The vein has widened out until there is no probability of a shortage of rock for a long time.

Larsen & Greenough, at Mullan, are going to enlarge the Morning mill. The Morning and You Like mines are now showing up ore so well that there is no trouble keeping the mill supplied.

Considerable ore has been struck in the Topeka, near the head of Nine-Mile. The strike was made near the surface and the ore shows chloride of silver, bromide of silver, galena, from $8 to $35 in gold, and traces of copper.

Mining Journal: The second washup of the Cariboo hydraulic mine amounted to about $30,000. They are still piping on No. 1 shaft, and will probably have another washup this fall, but that depends on the amount of water. The two washups for the season come to about $120,000.

WYOMING.

The new gold mines recently discovered in southern Wyoming are situated on the south fork of the Grand Encampment and its tributaries. Many prospectors have already reached the district, and locations are being made in every direction. In some instances there are six locations on a single claim. It is estimated that there are 200 miners in the district. The district is thoroughly organized with good officers, and excellent rules have been adopted for its management. The formation of the district varies and seems to run in distinct belts in a northwest and southeast course, consisting of mica schist, quartzite, lime and granite. The veins will average about three feet in width, and in most cases show free gold by panning. Assays made on different ores run from a trace to $40 per ton gold. The streams and gulches along the belt show well in placer gold and have all been located. On Spring and Jack creeks work has been successfully carried on for the past two years. In several places it is claimed that the miners are making good wages with the ordinary sluice boxes.

COLORADO.

Denver *Republican*: Has Cripple Creek paid? Has this vast amount of prospecting paid its own way and, on the whole, has the camp been a profitable investment? A carefully prepared summary on the value of the gold belt was published a few weeks ago. Therein its actual cash value was placed at $100,000,000; the speculative value at twice that amount. Now, to arrive at the cost of this immense value, the following estimates appear conservative:

There have been, approximately, 9000 locations of all kinds made in the district. Many of the locations never got beyond the stage of a 10-foot hole scratched in the hillside, a survey and recording fees; others cost into the thousands when attorney fees and court costs were to be added, but generally in such cases the ore was paying the freight on such as these. Therefore, these estimates are at best liberal:

4,000 patented claims costing an average of $500 each	$2,000,000
5,000 unpatented locations, costing an average of $100 each	500,000
Cost of the claims	$2,500,000

To say that for the past three years an average of 1000 lessees have been at work developing this ground that represented an expenditure of $2,500,000, and that each of these 1000 men were expending in labor and ammunition on the ground an average of $1000 each, looks to be an exaggeration, but put it at that and we have $3,000,000 expended by lessees.

Money spent in the purchase of ground and in prospecting the same is yet more difficult to arrive at. Adding all the large sales that can be remembered and doubling the sum gives $1,500,000, and it is extremely doubtful whether that sum of outside money, that is, money not extracted from the district itself, has been expended in the purchase of claims.

This, then, gives for the total cost of the Cripple Creek district, for all its prospecting, its purchase, for the opening of the mines and their equipment, the following:

First cost of ground	$2,500,000
Work of lessees	3,000,000
Capital invested in second purchases	1,500,000
Total	$7,000,000

Against this the output of the camp stands as follows:

1892	$ 600,000
1893	2,100,000
1894	3,000,000
1895	8,000,000
1896	10,000,000
Total	$23,700,000

If these estimates of first cost and the former ones of present value be as conservative as were the efforts to make them so, the balance sheet gives the district credit with $23,700,000, against a debt of $7,000,000.

T. J. Moynahon has received his patent for the Pike's Peak placer, consisting of 86 acres of ground that extend from Golden avenue west of First street to Mineral Hill in Cripple Creek. Many thousand dollars have been taken from the ground by placer mining, but now that patent is secured lessees are going after lodes of which several are said to exist.

A four-foot vein has been cut 80 feet from the shaft at the 200-foot level of the Colorado City on Bull hill. The ore runs two ounces without sorting. The north half of the claim was bought by the Golden Fleece Company some months ago for $65,000, and systematic development started.

The Ben Hur Company are considering a tunnel proposition whereby 600 feet of their property will be prospected without cost to the company.

The Victor will output more ore this month than any previous month of its operations.

The large pump for the Arcadia has arrived and will be put in place at once. Sinking the shaft was suspended at the fourth level.

In the Alma district is reported a new strike recently in the Zuri claim on Loveland, up Buckskin gulch, and a mill run shows 40 per cent iron, over $20 in gold and small silver values per ton. The vein is well defined and ore more than seven feet in width.

Three sales have been made of property in the North Mosquito district within as many weeks, that of a controlling interest in the Troy group to Chicago capitalists for $100,000 being the largest.

The production of the properties operated by the Gold Coin Mines Company in Nevadaville during the past month is the largest under its present management, about $28,000 from 1750 tons of ore.

At Idado Springs the Newhouse tunnel people have some big plans for treating low grade ores; they will cut in Clear Creek and Gilpin counties. They will erect mills at the mouth of the tunnel. They have bought most of the ground lying along Clear creek in the lower end of town.

Drifting has been commenced at 560 feet in the Crown Point-Virginia shaft and three feet of pay ore is being blocked out, with some shipments.

W. H. Smith and W. H. Wiley have secured control of the Edgardine property, and it is understood that an agreement has been made with the Newhouse tunnel management for the sinking of the shaft 600 feet to connect with the tunnel and thus make the first air hole connection with that big bore.

NEW MEXICO.

Silver City *Enterprise*: At Pinos Altas the Treasure Mining Company has about thirty-five men employed in the Atlantic mine and mill.

N. Bell has brought from Pinos Altos two gold bricks, which weighed 328 ounces, the product of ores from the Mina Grande and Pacific mines.

Chandler & Co. have cleaned out and drained the Mountain Key mine to the 300-foot level. The levels and stopes have been retimbered and ore is being extracted from the 200-foot and 300-foot levels.

The Golden Giant Company is working forty-five men at the mine and mill. The mill is kept running constantly on the product of the mine. Sinking the shaft below the 400-foot level progresses at the rate of a foot per day.

SOUTH AFRICA.

Reports upon the cyanide process in the big plants on the Rand show that the cost has been considerably reduced. The return of the Robinson cyanide works (zinc precipitation) for the year 1895 was:

	s.	d.
Wages (whites and natives, with food)	0	7.42
General supplies (stores, assay material, etc.)	0	2.76
Fuel	0	2.82
Cyanide, .46 pounds	0	9.88
Zinc, .16 pounds	0	0.66
Filling and discharging	0	9.51
Cost per ton	2	9.05

The Crown Reef return is as follows:

	s.	d.
European wages	0	4.201
Kaffir wages	0	1.784
Stores and materials	1	7.111
Maintenance	0	2.223
Contractor (filling and discharging)	0	7.768
Power and light	0	0.962
Cost per ton	3	0.049

At the Worcester works the costs were:

	d.
Filling and discharging	10
Cyanide (¼ pound)	6
Zinc	1.2
Caustic soda	0.5
Lead	1.1
Iron	2.2
White labor	5.2
Native wages and food	1.9
Coals	4.6
Stores and general charges	3.2
Cost per ton	35.45 (say 3s)

This was with cyanide at 2s per pound. With cyanide at this figure the economy in this item might counterbalance the heavier precipitation charges. Cyanide is now 1s 1½d per pound. The zinc charge at several mines is as low as 7d per ton. Lead and iron alone at the Worcester cost 3.3d per ton. The following table shows the costs for the City & Suburban for August, treating 15,410 tons:

	s.	d.
White labor	0	2.362
Kaffirs (food, etc.)	0	0.369
Stores and sundries	0	0.255
Chemicals	0	0.260
Zinc	0	0.6178
Cyanide	0	10.5011
Assaying and smelting	0	1.4520
Vat filling	0	3.8308
Vat discharging	0	7.3954
Electricity (light and power)	0	.1928
Maintenance	0	.3721
Cost per ton	2	3.608

Even assuming that a saving in cyanide to the extent of 6d is achieved, this is fully counterbalanced by the cost of the lead, iron, power for dynamo, and extra charges due to greater cost of plant in the case of electrical precipitation.

Mining Journal: The following is the directors' report of the City and Suburban for August: Profit for the month, £13,711 17s 3d; capital expenditure, £3106 6s 6d; total expenses per ton, 25s 10.2969d; value of yield per ton, 39s 6.8961d; profit per ton, 13s 8.5992d. Extract from manager's report: The main incline shaft (20 feet by 5¼ feet) has been sunk 29 feet 8 inches; total to date, 1749 feet 2 inches; driving and sinking done during the month, 1177 feet 9 inches; ore developed during the month, 16,038 tons; estimated quantity of ore developed at 31st of August, 390,053 tons. The milling results for the month are as follows: One hundred and sixty stamps worked twenty-three days three hours eight minutes; tons (2000 pounds) crushed, 19,450; tons crushed per stamp per day, 5.255; yield in smelted gold (equal to 5855.0060 ounces fine gold), 6774.8 ounces bullion; yield per ton by amalgamation, 6.9663 dwts bullion; assay value of tailings per ton, 5.748 dwts fine gold. The results by cyanide treatment for the month are as follows: Tons (2000 pounds) treated at a cost 4s 6.4710d per tons, 15,587; assay value of tailings per ton before treatment, 5.778 dwts fine gold; bullion produced (equal to 3267.0886 ounces fine gold), 4019.6 ounces; yield of gold (in bullion) per ton treated by cyanide, 5.1576 dwts; yield of gold (fine gold) per ton treated by cyanide, 4.1920 dwts; yield in fine gold per ton crushed, by amalgamation, 6.0205 dwts; by cyanide, 3.3594 dwts; by slags, 0.1149 dwts; total yield per ton (in fine gold) from all sources, 9.4948 dwts.

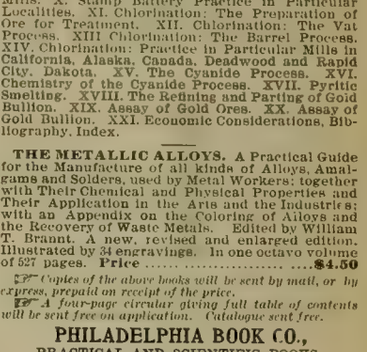
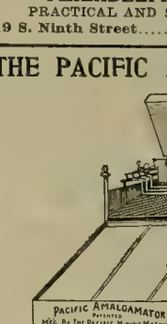
THE PACIFIC AMALGAMATOR





MILL or PLACER.

A Guarantee with Each Machine.

This machine is the finest gold saver for both placer mines and quartz mills. No other plate necessary in mills where the Pacific Amalgamator is used. It is constructed almost entirely of metal; it can be transported on pack train. Possesses a large amount of silvered amalgamating plate surface. No scouring of amalgam. Any ordinary amalgamator can operate the machine with good success. Send for catalogue.

Coast Industrial Notes.

—The first oysters raised for the market at San Pedro will soon be placed on sale.

—The Temescal, Cal., Water Company is about to assume a bond indebtedness of $175,000.

—El Cajon, San Diego county, has shipped twenty-nine carloads of raisins thus far this season.

—The Whitmore mill on Oregon Gulch mountain, Trinity county, has been destroyed by fire. Loss, $8000.

—Johnson, Halstead and McCabe, at El Cajon, San Diego county, have their drying-house filled with Havana tobacco. They will cut a second crop in about six weeks.

—A contract has been let for $100,000 for the extension of the government jetty at the mouth of San Diego harbor and one for $8000 for raising the levee near the mouth of the San Diego river.

—Joseph Sexton of Santa Barbara county has sold a carload of pampas plumes to be shipped East via the Southern Pacific and by water to Hamburg. There are sixty-seven cases in the shipment and 3000 plumes in each case.

—Raisin seeds contain about 16 per cent essential oil, and from 30 to 40 per cent of glycerine, the extraction of which has been found profitable in Germany. In view of this, Fresno, Cal., raisin growers are about to erect a raisin seed plant.

—The Visalia Land Office is of present interest to oil land claimants. Thousands of acres have been taken up under the law applying to mineral claims, but the Secretary of the Interior has decided that oil is not mineral and that the claims made are void.

—The annual report of the Southern Pacific Company for the year ending June 30, 1896, just filed with the Board of Railroad Commissioners, shows a comparatively small surplus from the year's operations, but the results are more satisfactory than those for the year ending June 30, 1895, which closed with a considerable deficit.

—In the oil industry of Los Angeles during October, 1895, there was a surplus of over 100,000 barrels of crude petroleum in the oil district, and nearly 30,000 barrels stored in tanks about the city and outside the field. Many wells were shut down because of a lack of tankage, and fuel oil sold as low as from 25 to 35 cents per barrel. Present quotations are $1.05 per barrel at the tanks. The present surplus is not over 55,000 barrels.

—The canal and locks at the Cascades of the Columbia in Oregon were opened for navigation November 5th. For the present they will be operated for the passage of boats only during the hours of daylight, and it may be necessary to still further limit their use to certain hours of the day, in order not to interfere too much with the work still in progress. The locks have been under construction for more than fifteen years, and the United States Government has expended about $3,000,000 on them.

—Seventy-four vessels formed the British Columbia fleet that went this year to hunt seals. The catch of 1896 will not total even 60,000, 20 per cent less than last year, which was regarded as an unsatisfactory season, and when the total catch was 74,124 skins, a drop from the total of 94,474 skins the year previous. Dividing this year's catch proportionately among the sixty-four vessels of the fleet, with their 800 white and 1118 native hunters, it would just about meet the cost of outfitting and wages, leaving nothing for the ship-owners who have invested their capital in this once profitable Pacific Coast industry.

—Reports come from Washington that the Chief of the Bureau of Yards and Docks, in his annual report to Secretary Herbert, makes a cut of two-thirds in the estimates for the maintenance and improvement of navy yards submitted by the various commandants. They asked for $6,996,620. He reduced the estimates to $2,245,043. Some of the principal items he indorsed are as follows: Mare island, Cal., quay wall, $30,000; dredging, $20,000; Puget Sound station, clearing work, $10,000; wharf, $60,000; officers' quarters, $12,000. The Chief also submits an estimate of $225,000 for suitable ways and sheds for laying up torpedo boats, but does not indicate location.

Recently Declared Mining Dividends.

Swansea, Utah, $5000, payable November 10.

Mammoth Mining Company of Utah, 5 cents per share, $20,000; November 2d.

The Le Roi Mining and Smelting Company, British Columbia, $25,000, payable October 28.

Anaconda Copper Mining Co., Montana, 5 per cent on a capitalization of $30,000,000, or $1,500,000, the profits of six months, payable November 1.

Ontario Mining Co., Park City, Utah, $15,000, payable November 4, a total of $13,325,000. This record has been surpassed only by the Calumet & Hecla.

Recent California Mining Incorporations.

Allender Gravel Mining Company, San Francisco; capital stock, $250,000, $625 subscribed,

Golden State Mining Company, San Francisco; capital stock, $300,000, all subscribed; H. and E. Lagan, C. B. McKinnon, G. P. Hall.

San Pedro Gold Mining Company, Vanderbilt; capital stock $1,000,000—D. McNamara, Vanderbilt, $250,000; C. K. Campbell, Vanderbilt, $500,000; J. D. Myers, Holton, $249,950; F. G. Janney, Salt Lake, $25; F. Williams, $25.

Personal.

J. Blair Shoenfelt of the Tortillata Mining Company in Shasta county has returned to his home in Douglass, Wyoming.

Ross E. Browne has returned from making an examination of gravel in the Fourmile district, Routt county, Colorado.

G. O. Laws of Junction City, Trinity county, has left for South America to superintend a placer mine for a Scotch company.

M. Provine has resigned after thirty-one years' continuous charge of the Empire mill, Grass Valley, Cal., an unusual term of such service.

Senor Carlos F. De Landro, a millionaire Mexican mine owner, is in Aspen, Colorado, inquiring into the approved process of treating ore.

Charles Gracey of Amador county has been appointed superintendent of the Southwestern Mining Company at El Dorado Canyon, Nevada.

Francis Muir of London, president of the De Lamar Mining Company, Limited, has been spending the week in De Lamar, Ida., looking over the company's property.

John M. Makwell of Leadville, Colorado, has been on the Klamath river, Siskiyou county, examining gravel mining property of the Princess Hydraulic Mining Company.

President Jordan, of Stanford University, left on Thursday for Washington, to present to the authorities there a statement of the condition of the seal fisheries in Behring's Sea.

H. A. Keller, consulting metallurgical engineer of the Mountain Mines, Limited, of Shasta county, has taken an office in the Crocker building and will make his headquarters here. He is directing the building of a second blast furnace for the mines.

J. W. Murphy, a well-known milling and mining man of the northwest, leaves next week for New Zealand, to take the management of the properties of the new mining company, the outcome of the Jay Hawk & Lone Pine Company, which is taking down its mills to transport to New Zealand.

J. B. Reinstein, a regent of the University and one of the trustees appointed by Mrs. Phœbe Hearst to arrange for carrying out her proposed gifts to the State University, left for the East on Tuesday to make arrangements for the international architectural competition in plans for buildings for the University.

Commercial Paragraph.

The Prospective Mining and Machinery Co., 127 First street, San Francisco, recently shipped a Tremain steam pump to C. C. Mathews, Tehachapi, Cal., for the Uncle Sam mine, and one to H. W. Russell, Mojave, for the South Park district, Inyo county.

"HISTORY OF CRIPPLE CREEK."

We have just issued in book form the only authentic and reliable history of Cripple Creek gold camp, the marvel of the mining world. The book contains numerous full-page illustrations (with map) of gold mines true to life. With the sole object of introducing our big 8-page 56-column illustrated weekly paper (established 1859) we will send a copy of the above interesting book free to all who send us 25c (stamps or silver), for a 3 months' (13 weeks) trial subscription to our big weekly, which contains the latest mining news and illustrations of Rocky mountain scenery. Club of 5 and 5 books, $1. Mention The Press and address, *Illustrated Weekly*, Denver, Colo.

THE OVERLAND LIMITED, VIA UNION PACIFIC.

Only 3 1-2 Days to Chicago-----3 1-2.
Only 4 1-2 Days to New York---4 1-2.

The Union Pacific is the only line running Pullman double Drawing-Room sleepers and Dining Cars San Francisco to Chicago daily without change. Only one change to New York; dining car service entire distance. Vestibuled composite buffet smoking and library cars between Odgen and Chicago.

The only line running upholstered Pullman Tourist sleepers San Francisco to Chicago daily without change, and personally conducted excursions to St. Paul and Chicago without change, leaving San Francisco every Friday.

Tickets and sleeping-car reservations at No. 1 Montgomery St. Steamship tickets on sale to and from all points in Europe. D. W. HITCHCOCK, General Agent, San Francisco.

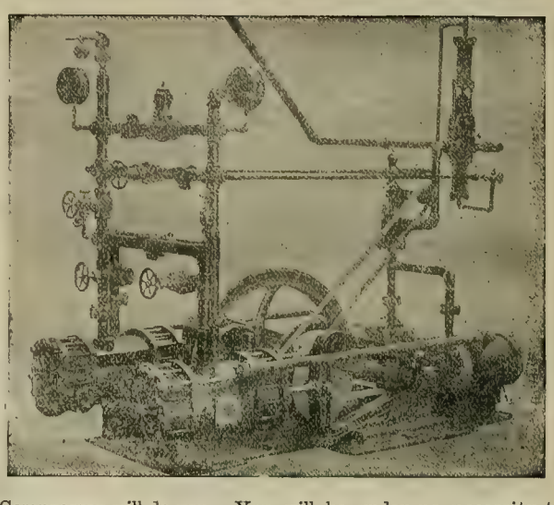
DOUBLE PIPE AIR COMPRESSOR.



This is a cut of the Double Pipe AirCompressor, the Compressor that is guaranteed to save 30% in power over any other make. It is cheapest to buy, cheapest to carry about and cheapest to run. If your fuel or water costs you anything, you want this Compressor. If you can get railroad freights free, and can carry machinery to your mine without cost, and your power costs you nothing, any make of Compressor will do you. You will be under no necessity to write to PNEUMATIC POWER CO., at 306 Pine St., San Francisco, Cal. We could save you money, though, in cost of foundations, as our Compressors are half the size of other makes.

DEWEY & CO., 220 Market St., SAN FRANCISCO,

PATENT SOLICITORS.

ESTABLISHED 1863

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St., S.F.

STUDY AT HOME

ELECTRICITY

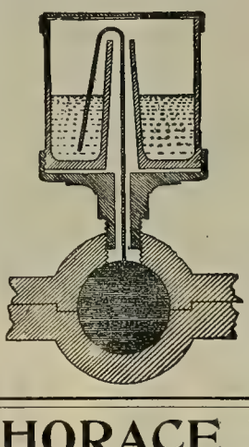
Positively Reduces Oil Bills 75 Per Cent.


THE FINCH OIL CUP.
Frictional vibration by the motion of the shaft against the point of the wire causes the oil to flow, and that this flow is not produced simply by syphonic or capillary action but by frictional vibration is proven by the fact that if the wire does not rest on the shaft then the oil will not flow. When the machinery stops the feed stops, therefore **the Finch Cup is Absolutely Automatic, Feeds Enough Oil and No More, Prevents All Waste, Needs Very Little Attention.**

Read One of the Many Testimonials:

UNION GAS ENGINE CO. SAN FRANCISCO, July 19, 1894.
During the past three years we have used your Cups for the crank shaft bearings of our engines, and also on all bearings of shaftings and tools in the shop. Our engines now *require no attention* except to fill the Cups occasionally, and therefore we can cheerfully recommend the Finch Cups to any one as *being the best in the market.*

HORACE F. BROWN, CONSULTING ENGINEER.

Special attention given to preparing plans for the Chlorination and Bromine Processes of Treating Gold Ores.

PATENTEE { Brown's Complete Automatic Mill Process. Brown's System of Mechanically Stirred Roasting, Cooling and Conveying Furnaces. Etc.

1607-8 Manhattan Building, Chicago, Illinois.

KENDALL GOLD AND SILVER EXTRACTION CO.
THE KENDALL PROCESS is the most efficient method of using cyanide for the extraction of precious metals from their ores. Wherever this process has been adopted the result has been increased percentages of values recovered and saving of time. Material reduction in consumption of chemical has also been demonstrated with respect to several classes of ores.

All ores, without exception, amenable to cyanide treatment can be treated to better advantage by the Kendall Process. This can be accepted as an axiom.

The Kendall system of gold and silver milling comprises (1) the Extraction Process, in which the chemical solution extracts the values from ores; (2) the Recovery Process, by which the gold and silver are obtained from the solution, and (3) a modified form of plant, not indispensable, but permitting the use of unskilled labor.

Owners of mines and reduction works can obtain full information on application to
KENDALL GOLD AND SILVER EXTRACTION CO.....47 Broadway, New York City.

The General Gold Extracting Co., Ltd.,
PELATAN-CLERICI PROCESS.
Patented in U. S. and Other Countries. Capital, £100,000.
London Head Office.....8 Drapers Gardens.
Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.

This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.

Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.

F. CLERICI, Manager for U. S.

DEWEY & CO., Patent Solicitors, 220 Market St., San Francisco.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will have inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address **DEWEY & CO., Patent Agents, 220 Market St., S. F.**

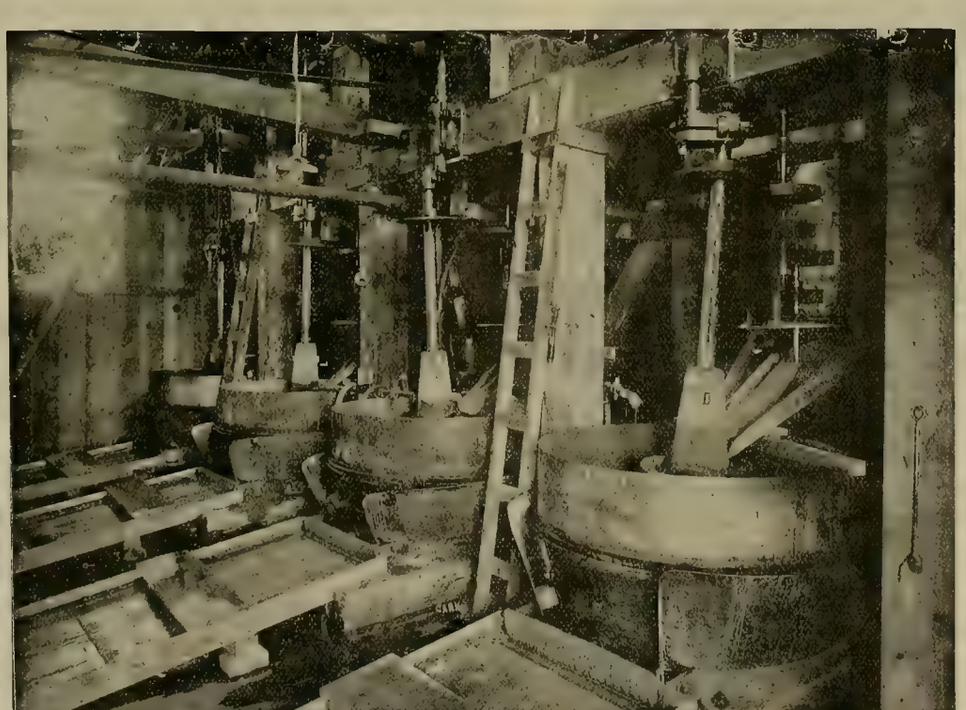
THE . . . . . DANIEL BEST CRUDE OIL . . ENGINE . . . .

CAPACITY,
2 to 200
HORSE POWER.

The Cheapest Power Known; Invaluable Where Fuel Is Scarce.

The most economical motive power ever invented, costing but 0 cents per H. P. per ten hours' un, using crude oil. Cheap, safe, eliable and clean. Strong and imple to operate. Requires no ngineer, and when you stop, all xpenses cease, and no fire is left o endanger your building. Send or Illustrated Catalogue with full articulars, and mention the MIN-NG AND SCIENTIFIC PRESS.



THE KINKEAD QUARTZ MILL.

The Kinkead Quartz Mill will do the work of five stamps with less than half the power, and can be built and put into operation for less than half the cost of stamps. The only wear is the shoe and die, which is less than that of one stamp. The cheapness in first cost and operation of this Mill makes it possible to work with profit ores so low in value that they have heretofore been treated as waste. Each Mill will crush 10 tons in 24 hours through a 40-mesh screen.

It requires only a 2-horse power Daniel Best Crude Oil Engine to operate this Mill and one concentrator. Engine and Mill can be set up and running in 48 hours.

Price of Mill $1,000, f. o. b. San Francisco, including Self-Feeder, Ore Hopper, Frame and Foundation Timbers all framed, and one Silver Copper Plate. Weight, 2½ tons; heaviest piece, 1350 pounds.

One ordinary mortar for a 5-stamp battery will weigh more than our whole mill. This Mill can be made in 300-lb. sections, if desired, at extra cost. Send for Catalogue.

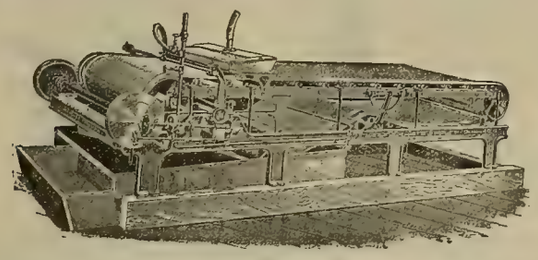
MINING AND MILLING MACHINERY.



"TRIUMPH" ORE CONCENTRATOR.

TELLURIDE, COLO., July 14, 1896.

Joshua Hendy Machine Works, San Francisco, Cal.—GENTLEMEN: Yours of recent date duly received. Regarding the "Triumph" Concentrator, we have eight 5-foot and eight 4-foot machines: they are giving perfect satisfaction. In addition to the above we have ten "Frue" Vanners. I am replacing these with your machines as fast as possible, as all our experiments show the "Triumph" to make a better saving, and their capacity is much greater in every respect. I consider the "Triumph" superior to anything of the kind we have ever used. Yours very truly, [SIGNED] N. T. MANSFIELD, Gen. Supt. The Smuggler-Union Mining Company.

QUARTZ MOUNTAIN, TUOLUMNE CO., CAL., April 25, 1896.

Joshua Hendy Machine Works, San Francisco, Cal.—GENTLEMEN: Having carefully noted the operations of the "Triumph" Ore Concentrators you put in for the App mine, I am pleased to state, for your information and for such use as you may deem proper to make of this testimonial, that I am entirely satisfied with their operations, and especially the resultant high percentage of valuable concentrates which they save. Very truly yours, [SIGNED] FRED COOK, Supt. of App Mine.

PLACERVILLE, CAL., May 16, 1896.

Joshua Hendy Machine Works, San Francisco, Cal.—GENTLEMEN: The 5-foot "Improved Triumph" Concentrators we have at work in our Grand Victory mill are giving us the best of satisfaction. They do nice clean work, with very little attention, and do not easily get out of repair, and we are carrying to each of them at least 50 per cent more pulp than to our 4-foot Frue Vanners, in operation in the same mill. Our sulphurets are exceedingly fine and require very close concentration, and the "Triumph" seems to do it just about right, and should we add to our concentrating capacity we shall certainly use more "Triumphs." Very truly yours, [SIGNED] GRAND VICTORY GOLD MINING CO., Per H. E. Picket, Manager.

Improved Self-Contained Cushion-Frame Five-Stamp Mill.
Patented in the United States and Foreign Countries.

The Improved, Iron-Frame, Self-Contained, Cushion-Frame, Five-Stamp Mill Saves Bills for Heavy Timbers, Millwright and Mechanics' Labor, and a Large Amount of Space. The term "Setf-Contained" Means a Great Deal to the Mine Owner, and Can Be Readily Recognized and Appreciated in Making an Estimate For an Ordinary Five-Stamp Plant, When the Comparative Cost is Considered Over a Wood-Frame Mill.

FIRST: There is Saved by the Use of This Mill a Large Bill for Heavy Timbers, in Many Instances Obtained at Great Expense and Loss Of Time.

SECOND: The Saving in Mill-Wright and Mechanics' Labor in Framing and Erecting.

THIRD: The Large Amount of Space Saved.

Late improvements in the amalgamation and concentration of ores enable us to offer to the mining public, in connection with our Self-Contained Mills, an apparatus which amalgamates and concentrates at the same operation and provides a perfect trap for escaping quicksilver. Write to us for information.

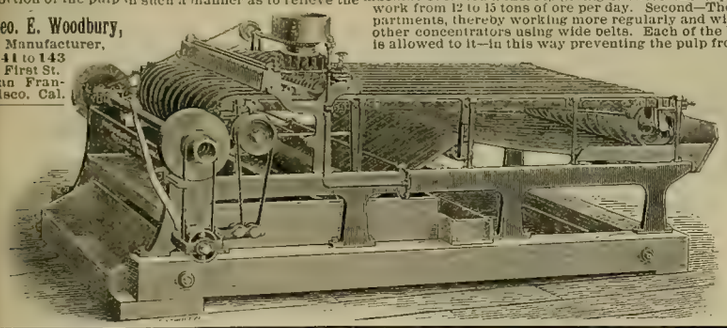
THE WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS

was awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891. MORE THAN DOUBLE THIS CAPACITY with one-half less power and occupying less than one-half the space of any other concentrator. Built of best Steel and Wrought Iron. Strong and durable. Price $575 f. o. b. Send for Catalogue and Testimonials.

The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge. THE IMPROVED MACHINE HAS THE FOLLOWING MERITS: First—The improved belts, which consist of seven, are constructed and arranged so as to allow each belt to receive a portion of the pulp in such a manner as to relieve the machine of its load, thereby giving it twice the capacity of other concentrators, and enabling it to work from 12 to 15 tons of ore per day. Second—The machine equalizes the load by several compartments, thereby working more regularly and with much less attention than is necessary to give other concentrators using wide belts. Each of the belts on this machine takes care of the pulp that is allowed to it—in this way preventing the pulp from running to the lower side of it, as is the case when a machine becomes out of level where wide belts are used. Third—The belts run on a perfect line, needing no adjustment to prevent their running from side to side, as in other concentrators. Fourth—The belt surfaces are improved by indentations and corrugations, causing the Concentrator to save fine sulphurets and quicksilver, and perform close work. Fifth—The belts have fluted or corrugated edges, to form an expanded top edge, which effectually prevents from cracking. Sixth—The feed arrangement is perfect. Seventh—The machine is constructed of iron, with steel crank-shaft self-oiling boxes, and everything made in the most thorough manner, enabling it to run with very little attention or wear.

Geo. E. Woodbury, Manufacturer, 141 to 143 First St. San Francisco, Cal.



PATENTED, Aug. 19, 1890.

This Concentrator took the 1st prize at the San Francisco Mechanics' Institute in 1890, 1891 and 1892, and at the California State Fair in 1892; it took the 1st prize at the World's Columbian Exposition 1893, and at the San Francisco Midwinter Fair, 1895.

30 and 32 FREMONT ST., SAN FRANCISCO.

Spadone's Concentrator Belts. Patented.

The "SPADONE" Curved Edge Concentrator Belt is attracting much attention among mining men, its merits appealing to the millman of practical experience.

Illustration (Fig. 1.) shows a cross-section, and (Fig. 2.) shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. *We avoid this Mechanical Defect by our Spadone Curved Edge.* Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

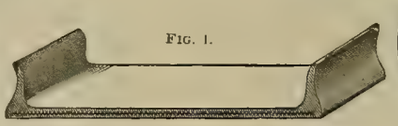

FIG. 1.

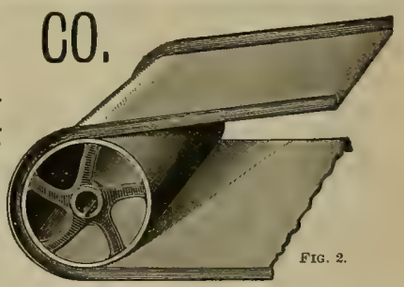

FIG. 2.

We shall be pleased to quote you also on Water, Air Drill, Steam, Suction and Fire HOSE, RUBBER BELTING and RUBBER PACKING. Correspondence Solicited.

Market Reports.

The Markets.

SAN FRANCISCO, Nov. 5, 1896.

There is a general sigh of relief that the election is of the past and for another four years we will be free from another exciting Presidential election. Already business is taking on new life, and, while buying is still on conservative lines, there seems to be a growing conviction that low prices, for a time at least, have seen their day. Manufacturers are increasing their output of goods, while importers of foreign goods have increased their orders. This is made necessary owing to the comparative light stocks carried by manufacturers, importers and the wholesale and retail trade. Press advices are to the effect that many enterprises held in abeyance until the result of the election is known will now be carried to fruition, not only at the East but also on this coast.

It is stated in financial circles that the large sums of money which had been withdrawn and hoarded will now come out for investment. This will have a favorable influence and cause a general easing in the rates of discount and a more general desire for investment. It is stated that the importation of gold from Europe will be continued for fully one month, so as to meet purchases of farm products and also American securities, provided prices continue up. In Europe the money markets are cabled active, with the rate of interest firm and steadily tending against borrowers. It is also cabled that the premium on gold is slightly higher.

New York Silver Prices.

NEW YORK, Nov. 5.—Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.
Friday	29 15-16	64⅞
Saturday	30	65
Monday	30	65
Tuesday	30 3-16	
Wednesday	29 15-16	64½
Thursday	29 15-16	64½

	Copper.	Lead.	Iron.	Tin.
Friday	10 75	2 85	10 25@12 50	13 00
Saturday	10 75	2 85	10 25@13 00	13 00
Monday	.....	.....	.....	.....
Tuesday	10 75	2 85	10 25@13 50	12 05
Wednesday	10 75	2 85	10 25@13 50	13 05

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	7@8
Commercial Loans, prime	6@8
Call Loans, gilt edged	6@7
Call Loans, mixed securities	7@8
Mortgages, prime, taxes paid by lender	8@8
New York Sight Draft	Par
New York Telegraphic Transfer	Par
London Bankers' 60 days	$4.82
London Merchants	$4.81½
London Sight Bankers	$4.85
Refined Silver, per oz., 1000 fine	64½
Mexican Dollars	50½@51½

SILVER.—The market here, at the East and abroad advanced slightly up to Tuesday. Yesterday, following the election, the markets weakened slightly, but neither in New York nor in this city did silver bullion sell below 64¼ cents. This information is given to us by bankers and bullion dealers, and is at variance with stock reports. To-day the markets are reported quiet but firm, owing to light stocks held here and at the East. The absence of much of a demand from India, owing to the small farm crops, and the limited demand from China offsets the reported reduced outturn of the mines. The last steamer for the Orient took out $152,620 in bullion for Hiogo.

MEXICAN DOLLARS.—The market is quiet at unchanged quotations. The last steamer for the Orient took out 67,823 dollars for Hong Kong and 50,000 for Singapore.

COPPER.—The market is slightly firmer, in sympathy with the East, where an improved feeling is reported to have set in. There is a good export movement from the Atlantic seaports and an increasing domestic demand.

Ingot, jobbing	—@14
Ingot, wholesale	—@13
Sheet copper	—@16½

QUICKSILVER.—There is a good shipping demand both by sea and rail.

The market is quoted as follows:

Domestic trade, per flask	36 50

For export, quotations are nominal but less than for home.

LEAD.—The markets at the East are slightly stronger. Our market is reported firm.

Our market is quoted as follows:

Pig	—	@	3 60
Bar	—	@	3 95
Sheet	—	@	5 25
Pipe	—	@	4 50

SHOT.—There is a good seasonable demand.

Drop, sizes smaller than B, per bag of 25 lbs			$1 20
Drop, B and larger sizes,	"	"	1 45
Buck, Balls and Chilled, do,	"	"	1 45

ANTIMONY.—The demand is fair, with the market firmer at 7¾@8⅛c in a jobbing way. New York mail advices quote 7¼ for Cookson's, 6½c for Hallett's and 6⅝c for Japanese, from store.

BORAX.—There is a good outward movement to the East.

The market is quoted as follows:

Refined, in car lots	6½
Refined, in sacks	5¾
Powdered, in car lots	5¼
Concentrated, "	5⅝

TIN.—The markets for pig abroad and at the East are strong at higher prices. The advance is said to be due to heavy deliveries abroad. Tin plate is still slow.

Pig, per lb			13½c@ —
Plate, I C coke, heavy, per box	—	@	$4 05
" " " light, "	—	@	3 95

IRON.—The market is strong with a free consumption reported. Our New York mail advices report as follows: There is a growing disposition to compare prevailing conditions with those of 1879. Many flaws may be revealed in such a comparison, but the fact remains that business men are confident that 1897 is to be a good year. Pig iron has advanced at Philadelphia 25 cents per ton more and is up from 50 to 75 cents from the lowest. Plate mills are having the best demand. Sales agents at St. Louis have been advised not to make sales until after election, except at an advance of 25 cents a ton. Business at Cincinnati has been smaller than in recent weeks, partly because offerings have been withdrawn. There is no more free storage iron to be had at Pittsburg, and most furnaces ask $12 for delivery during the first quarter of next year. There is a good demand for iron at Birmingham and deliveries on maturing contracts are being made to the full extent of shipping facilities.

AMERICAN.

	To Arrive.	Spot.
Sloss	$21 00	$23 50
Thomas	22 00	23 50
Salisbury	30 00	33 00

ENGLISH.

Barrow	$21 00	$23 0
Gartsherrie	21 50	23 0
Bolt	¼ & 5-16, 20c; ⅜ and larger, 17c	
Lake Superior Sheathing		20

POWDER.—The market is essentially unchanged.

The market is quoted as follows:

Hercules, No. 1*, per pound	11½c
" No. 2, " "	8½c

COAL.—There is a firmer feeling for cargoes of Australian for shipment, owing to a scarcity of vessels, due to good wheat crop prospects and a disposition to remain at Australian ports in consequence. Our market for spot is steady. Freight rates from Europe are higher.

We quote as follows:

SPOT FROM YARD—PER TON.

Wellington	$7 50@ 8 00
Greta	6 00@ 6 50
Nanaimo	6 50@ 7 00
Gilman	5 50@ 6 00

Scotch Splint	
Cardiff	6 25
Lehigh Lump	9 00
Cumberland	13 00
Egg, hard	10 00
West Hartley	6 50

COKE.—The market is quoted as follows:

Gas Companies'	— —		— —
English, to load	8 00	@	— —
" spot, in bulk	8 00	@	9 00
" in sacks	8 50	@	— —
Cumberland	— —	@	— —

LUMBER.—There is a continued good outward movement.

Redwood, Fluming	17 00	@	— —
Pine	14 00	@	19 00
Spruce	26 00	@	31 00

NAILS.—There is a good demand. At a meeting of the directors of the Syndicate held at New York no change in prices were made and none is expected before December or January.

The market is quoted as follows:

Wire, carloads, basis per keg			$3 20
" jobbing, " "			3 30
Cut, carloads, " "			2 95
" jobbing, " "			3 05

Mining Share Market.

SAN FRANCISCO, Nov. 5, 1896.

Business on the two exchanges has been quiet, but notwithstanding which the market held firm. The impression prevails that with the election well out of the way and general business resuming its normal condition there ought to be more activity in the market, particularly in the shares of mines giving promise of the best results from work now underway. The attention of the trading public is largely centered on the Brunswick lode, owing to it not having been honeycombed through years of almost continuous work and therefore a strong probability of finding considerable ore. Comstock mining men are quite hopeful that something of importance will be discovered on that lode, not only in Chollar but also in another mine. Even if these expectations are realized it will take time and considerable work and expenditure of money before the ore could be placed in position for safe, quick and economical extracting. The work in several of the mines on the Comstock is being closely watched owing to some of it being in comparative new ground, so far as the public knows, but whether any more ore will be uncovered than has been for several years past is an open question.

The following mining companies had cash on hand November 1: Andes, $6,775; Alta, $5,043; Alpha Con., $7,303; Belcher, $13,733; Best & Belcher, $11,406; Bullion, $6,835; Bodie Con., $991; Bulwer Con., $8,775; Church, $10,957; Con. New York, $961; *Con. Cal. & Va., $12,525; Crown Point, $10,249; Chollar, $10,388; Confidence, $5,258; Challenge Con., $87; Con. Imperial, $2,713; Caledonia, $4,070; Exchequer, $1,016; Gould & Curry, $7,465; †*Hale & Norcross, $195; Julia Con., $23; ‡Lady Wash. Con., $32; §Mexican, $394; Mono, $1,251; ¶Occidental Con., $2,157; Ophir, $16,053; Overman, $499; Potosi, $9,423; Savage, $909; Sierra Nevada $18,746; Silver Hill, $564; Standard Con., $27,292; Syndicate, $640; Seg. Belcher, $159; Union Con., $16,597; Utah Con., $3,552.

*Of unsold bullion, with further shipments to come, and with indebtedness at bank of $2248 and the monthly expenses to be paid.

†In cash, and ore the coin value of which is estimated at $6000, to meet the monthly expenses and a note of $10,000 at the Bank of California.

‡Thirty-two cents, with an indebtedness of $510.

§With $500 due the bank.

¶In cash, with the monthly expenses and the company's note for $2500 due the Nevada Bank.

The Silver King Mining Company has an indebtedness of $658 and is collecting an assessment of 25 cents.

From the Brunswick lode mail advices continue, practically, without any change worthy of special mention. In the Con. Virginia, Best & Belcher and Gould & Curry shaft a station has been cut out on the 300-foot level, and active drifting north and south will be started soon. Exploiting work in Gould & Curry is under way from the tunnel level. In Savage they are still pushing the east crossdrift on the 300-foot level. As yet, nothing of importance has been run into. In Hale & Norcross they are sinking the winze in the footwall. At last advices it was down about 695 feet. The north drift on the 400-foot level in Hale & Norcross has reached the Savage line, but owing to a seepage of water a drain had to be put in place. The latter company will take up the work, while Hale & Norcross may run crossdrifts for the purpose of finding out if there is a body of ore near by. All indications are quite favorable. The east crossdrift on this level, near the Chollar line, is being pushed slowly ahead. It will have to be run, as reported, about 80 feet before they expect to strike the downward continuation of the ore found above. In Chollar the upraise from the 200-foot level is up over 150 feet. Connection will soon be made above. On the 300-foot level they are following a narrow streak of good ore, and at the same time extending the east crossdrift, which is out over 90 feet. On the 400-foot level they are advancing the south drift. In Occidental they are pushing exploiting work on two levels.

From the Comstock mines the news received the past week is essentially unchanged, although in some respects it grows more interesting in one or two mines in each group on the lode. In Utah exploiting work is fairly well under way on one of the levels. In Union and Sierra Nevada the work heretofore mentioned is practically unchanged as is the material encountered. In Mexican the west crossdrift on the 1000-foot level is said to be in favorable formation, as is the west crossdrift in the Ophir on the same level. In the latter mine the work to the west on the tunnel level continues to attract the attention of mining men. The work on the 1000-foot level continues in favorable formation, and when exploiting work is resumed it is thought that quite a body of ore may be run into. The east crossdrifts on the 1650-foot level are pushed slowly ahead. From the 1750-foot level they still extract ore, but the quantity raised and assay value were both less than past week. The Best & Belcher and Gould & Curry east crossdrift is being pushed slowly ahead without any material change in the formation run through. In Savage active work is well under way on the levels mentioned last week. The news is unimportant. In Hale & Norcross work is continued on the 900-foot and 1100-foot levels. In Chollar and Potosi the work is on the same levels as heretofore published. In Bullion they are still advancing the north drift. In Alpha they are slowly extending a west crossdrift. When the powers that be are ready, it is said that quite a body of ore can be uncovered to the west in the mine. In Con. Imperial fair progress is being made in the two west crossdrifts. From Challenge, Confidence, Yellow Jacket, Belcher and Seg. Belcher no news regarding work is allowed to be made public. Confidence, Belcher and Seg. Belcher continues extract and raise ore. In Crown Point exploiting work is being done on several levels. Several hundred tons of low grade gold ore is extracted and raised each week. In Overman and Alta the work is about the same as has been heretofore made public.

The following illustrates the changes of the week:

Gas Engine Mine Hoist.

The attention of visiting miners is called to the advertisement of the "Golden Gate" Gas Engine, to be seen on another page. The Engine and Hoist has been thoroughly tested under varying conditions all over the coast, giving excellent results and satisfaction in every instance. Adam Schilling & Sons are the manufacturers, at 212-214 Main street. They invite investigation at all times. *

Stop at a Hotel?

All right, then. The Brooklyn at 208 to 212 Bush street is just the place. Central location, light rooms, first-class table and low prices. The Brooklyn is managed by Charles Montgomery, the best known hotel man on the coast. That he runs it right goes without saying. *

ANNUAL MEETINGS.

Company and Location.	Secretary and Office in S. F.	Date.
Occidental Con M Co	Alfred K Durbrow, 309 Montgomery	Nov 16

THE SANTA ROSA GOLD MINING COMPANY.

Properties located in the Cripple Creek Gold Mining District.

We believe we can give you the largest prospective value for the least money.

Investigate carefully; hesitate before buying other stocks; consider SANTA ROSA and know why you don't want it.

Call, write or telegraph to F. H. PETTINGELL, 10-11 Bank Block, Colorado Springs, Colo.

ANNUAL MEETING.—The Regular Annual Meeting of the stockholders of the Occidental Consolidated Mining Company will be held at the office of the Company, Room No. 69 Nevada Block, No. 309 Montgomery street, San Francisco, California, on MONDAY, the 16th day of November, 1896, at the hour of 1 o'clock P. M., for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such other business as may come before the meeting. Transfer books will close on Friday, November 13, at 3 o'clock P. M.

ALFRED K. DURBROW, Secretary.

GOLD MINE FOR SALE.

Covering Over 6000 Feet of the Mother Lode with Extensive Developments and Improvements.

Working Bond on Liberal Terms will be Given. Address O. H., Mining and Scientific Press Office.

The Jno. G. Morgan Brokerage Company,

BANKERS and BROKERS,

No. 1630 Stout Street.

Telephone 1293.

DENVER, COLO.

STOCKS, BONDS, GRAIN AND PROVISIONS.

Direct private wires to Chicago, New York, Cripple Creek, Colorado Springs and Pueblo.

Orders executed in large or small amounts for cash or on *reasonable* margins. Out-of-town orders by mail, telephone or telegraph will receive prompt attention. Daily market circular mailed free on application.

GOLD MINING PROPERTIES.

Having thoroughly canvassed this section of country during the past seven months, I am enabled to furnish valuable information to capitalists desirous of bonding or purchasing meritorious mining properties in El Dorado county. Prospects, partially or wholly developed properties, or purchasable interests ready for operation but lacking capital, can be had on favorable terms. Address, A. E. HAMILTON, P. O. Box 66, Placerville, Cal.

Every Miner Likes to Read This Paper.

The following illustrates the fact that every mining man, wherever he may be, reads the MINING AND SCIENTIFIC PRESS. It exemplifies the fact that thousands of progressive men weekly look with friendly interest for the arrival of this paper:

M. W. LOVERIDGE,
SUPERINTENDENT.

DUKE OF YORK HYDRAULIC MINING CO
ALBERNIE, VANCOUVER ISLAND, B. C.
October 25th, 1896.

MINING AND SCIENTIFIC PRESS,
San Francisco, Cal.

Enclosed please find P. O. order for $3.00 for one year's subscription. I have been a reader of your paper for over 20 years, and though not all of this time a personal subscriber, it has always been taken by several in the camps where I have been. I subscribed for the paper for some seven or eight years while I was in South America, and now here the same as while there, I find I can get more information in regard to what is going on in all the mines from the "Mining and Scientific Press" than I can from all the other papers I get. Yours truly,

M. W. LOVERIDGE.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING OCTOBER 27, 1896.

569,991.—NEWSPAPER WRAPPING MACHINE.—W. A. Beebe, King City, Cal.

570,431.—TAP GRINDING MACHINE—L. D. Biddle, Los Angeles, Cal.

570,198.—GATE—Della R. Burnham, Pullman, Wash.

570,086.—BEER GOVERNOR—J. D. De Gear, S. F.

570,385.—FRUIT PICKERS' BASKET—A. M. Denig, Riverside, Cal.

570,157.—TRIGONOMETRICAL ELUCIDATOR—R. H. Edmiston, Los Angeles, Cal.

570,402.—CAR FENDER—L. A. Hufschmidt, S. F.

570,407.—BABY CARRIAGE—J. A. Johnson, Hoquiam, Wash.

570,026.—DUST PAN—A. Koehler, Baker City, Or.

570,223.—WAVE POWER—F. G. Little, Portland, Or.

570,257.—THRESHER FEEDER—J. W. Livermore, Kingsbury, Cal.

570,330.—MINING MACHINE—E. Patterson, Oakland, Cal.

570,338.—CARD DRIER—N. H. Reed, Santa Barbara, Cal.

570,344.—TROLLING HOOK—A. H. Smith, Snoqualmie, Wash.

570,113.—CORK CABINET—Wilson & Neely, Wilbur, Wash.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

FEEDER FOR THRASHING MACHINES.—John W. Livermore, Kingsburg, Cal. No. 570,257. Dated October 27, 1896. This invention relates to a mechanism for feeding unthrashed straw to thrashing cylinders of machines, which may be either stationary or applied to traveling harvesters. It consists of a smooth-faced cylinder journaled in front of the thrashing cylinder, with means for rotating it; a feeder belt adapted to deliver unthrashed straw above the feed and thrashing cylinders; an enclosed box or house within which the two cylinders rotate, and within which the discharge end of the feeder belt is contained; a flexible plate forming contact with the periphery of the feed cylinder and a corresponding inclined plate upon the front side, to prevent the straw from being carried behind the feed cylinder. Means are provided by which the feed cylinder is adjustable to or from the thrashing cylinder, as the character of the straw may require.

Every Inventor Wants a Good Patent

Or none at all. To secure the best patents Inventors have only to address DEWEY & Co., Pioneer Patent Agents, No. 220 Market St., San Francisco.

There are many good reasons why Pacific Coast Inventors should patronize this Home Agency.

It is the ablest, largest, best, most convenient, economical and speedy for all Pacific Coast patrons.

It is the oldest on this side of the American continent, most experienced, and in every way reliable.

Conducted from 1863 by its present owners (A. T. Dewey, W. B. Ewer and Geo. H. Strong), this agency has the best knowledge of patents already issued and of the state of the arts in all lines of inventions most common on this coast.

Patents secured in the United States, Canada, Mexico, all British colonies and provinces, England and other civilized countries throughout the globe.

Caveats filed, assignments duly prepared, examinations made, and a general Patent Agency business conducted.

Established and successfully and popularly conducted for nearly thirty years, our patrons number many thousands, to whom we refer with confidence, as men of influence and reliability. Old and new inventors are cordially offered the complimentary use of our library and free advice, etc. No other agency can afford Pacific States inventors half the advantages possessed by this old, well-tried and experienced firm.

PRACTICAL

Assessment Notices.

CHALLENGE CONSOLIDATED MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Gold Hill, Nevada.

Notice is hereby given that at a meeting of the Board of Directors held on the 14th day of October, 1896, an assessment (No. 22) of Ten (10c) Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 35, third floor Mills building, corner Bush and Montgomery streets, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 17th day of November, 1896, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on TUESDAY, the 8th day of December, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

C. L. MCCOY, Secretary.

Office—Room 35, third floor Mills building, corner Bush and Montgomery streets, San Francisco, California.

THORPE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Calaveras County, California.

Notice is hereby given that at a meeting of the Board of Directors held on the 14th day of October, 1896, an assessment (No. 4) of five (5c) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, No. 567 Market street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 12th day of December, 1896, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on SATURDAY, the 9th day of January, 1897, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

A. F. FREY, Secretary.

Office—No 567 Market street, San Francisco, California.

GREENWOOD GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Greenwood, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 16th day of October, 1896, an assessment (No. 1) of two (2c) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 79, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 23rd day of November, 1896, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 14th day of December, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHAS. E. ELLIOT, Secretary.

Office—Room No. 79, Nevada Block, No. 309 Montgomery street, San Francisco, California.

GOLD RIDGE CONSOLIDATED MINING AND MILLING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Nevada and Sierra Counties, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 20th day of October, 1896, an assessment (No. 5) of two and one-half (2½c) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Rooms 12 and 13, No. 43 Sixth street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 21st day of November, 1896, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 14th day of December, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

WM. F. MCLAUGHLIN, Secretary.

Office—Rooms 12 and 13, No. 43 Sixth street, San Francisco, California.

Brooklyn Hotel,

208-212 BUSH STREET,
SAN FRANCISCO, CAL.
Conducted on Both the European and American Plan.

This favorite Hotel, located in the best and most central portion of the city (being in the same block as the Mills Building and immediately adjoining both the Telephone Building and the First National Bank), is under the experienced management of CHAS. MONTGOMERY, and is as good, if not the best Family and Business Men's Hotel in San Francisco. Electric return call bells in rooms.

Board and Room per day $1.00 to $2.00.
Board and Room per week $6.00 to $12.00.
Single Rooms, 50 cts. to $1.00.
Family Rooms, $1.00 to $1.50.

FREE COACH TO AND FROM THE HOTEL

Miners, Attention!

Assaying Gold
.....AND.....
Silver Ores.

By C. H. AARON.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leach ng Gold and Silver Ores") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:—Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 126 12-mo pages, with illustrations, well bound in cloth; 1896. Price **$1.00** postpaid. Sold by the **Mining and Scientific Press**, 220 Market St., San Francisco.

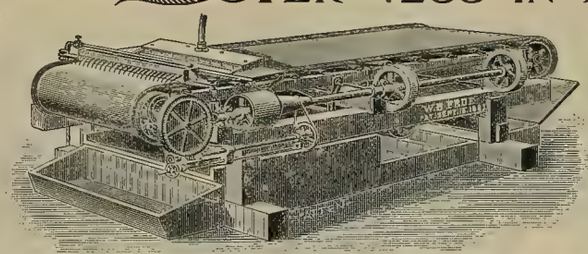
FRUE ORE CONCENTRATOR.

OVER 4200 IN ACTUAL USE.

Manufactured under Patents of

April 27, 1880;
September 18, 1883;
July 24, 1888;
March 31, 1891.
July 18, 1893.



It can be safely stated, without going into a description of several new and untried concentrators that have lately come into the market, that where sulphurets are of such value as to make close saving necessary, the Frue Vanner is always used. It is the only endless belt concentrator in the market that can be relied on to handle all classes of ores, and give universal satisfaction. (In all competition of concentrators the Frue Vanner is taken as the standard machine of the world and all comparisons made by it. There have been over 4200 of these machines sold, 1700 having been sold on the Pacific coast alone.) They are in use in every part of the world where mining is carried on and in all cases they are giving perfect satisfaction. From time to time valuable and important improvements have been made in this machine to increase its capacity and durability, and particular attention is called to the Patent Lip Flange for the rubber belt, which does away with nearly all the strain and cracking, as in the old style of flange, making the life of belt more than double that of other style belts in the market. The lip of flange bends outward in going over the large end rolls, thereby distributing the strain in the solid rubber, and bringing virtually no strain either at the edge or at the base of flange, as is the case in all belts with a raised edge.

For any information, pamphlets, circulars or testimonials, call on or address

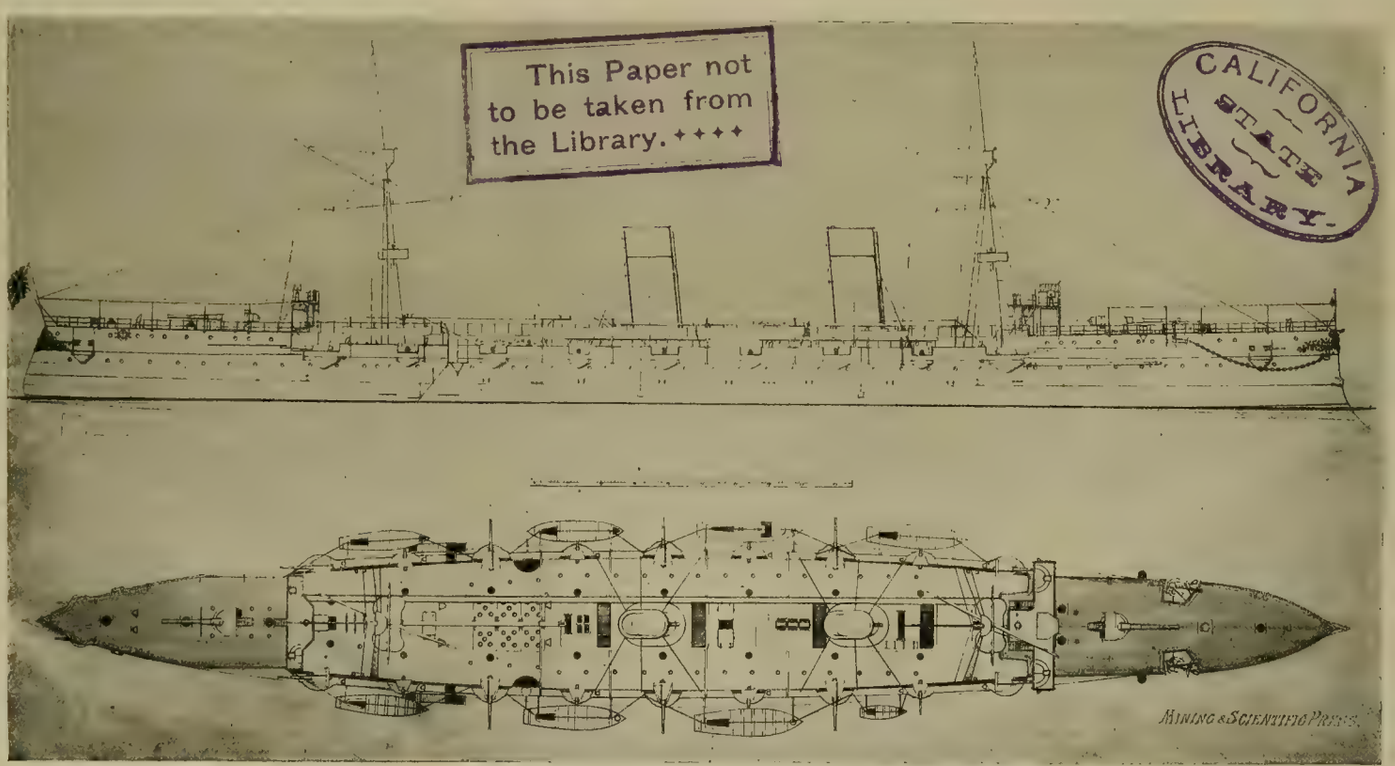
A Japanese Cruiser to be Built Here.

Herewith is an illustration that the MINING AND SCIENTIFIC PRESS has had prepared of the Japanese cruiser to be built by the Union Iron Works of this city. The upper part of the picture shows her lines and general appearance as completed: the lower part is a deck plan. The vessel will be a second class, high-speed, unarmored, protected cruiser, 405 feet 2 inches in length, 49 feet breadth, 17 feet 7¼ inches draft, 4760 tons burthen. Engines triple expansion, twin screw propellers, four double-ended and four single-ended boilers 14 feet 3 inches diameter. The armament will consist of two 8-inch 45-caliber quick-firing guns and twelve 12-centimeter guns, twelve 12-pound guns, and six 47-millimeter quick-firing guns: there will also be five torpedo launching tubes, one 14-inch fixed and four 14-inch training. The speed of the cruiser is to be 20½ knots an hour under normal draft and 22½ knots under forced draft. The securing of this contract is of industrial importance to the coast and the country. England and France competed for the work. This is the first contract of the kind secured here, and it is likely that other similar contracts will be secured after the Japanese Government sees what California can do in the way of producing a war vessel.



THE JAPANESE CRUISER TO BE BUILT BY THE UNION IRON WORKS.

A SOUTH AFRICAN CABLEGRAM says that the Pretoria court has declared void the MacArthur-Forrest patents for the recovery of gold by the cyanide patent. The long pending suit by Johannesburg mine owners against the company has thus been decided so far as the jurisdiction of the South African court is concerned. There was a similar contest some time ago in Mercur, Utah, which was finally compromised on terms understood to be favorable to the cyanide company. The decision, if correctly reported, will have considerable influence on the matter of royalties in every locality where the process is in use. The patentees never claimed that the solution of gold in cyanides is their original discovery, but claim that the direct application of cyanide in dilute solution for the extraction of gold and silver was an original discovery and patentable.

Oil Farmers.

A strong argument in favor of the bill we proposed in our issue of October 31st for presentation to Congress, amending Section 2329 of the Revised Statutes relating to placer claims, has been offered in Los Angeles. A decision from the Secretary of the Interior has been sent to the local United States Land Office on the contest by the Southern Pacific Company of an entry made by the Union Oil Company of California to the Central Oil Mine location in the Los Angeles land district. The land was included in a section made by the Southern Pacific Company, and the oil company contended that it should be excepted from the selection as mineral land. There was every justice in the claim. Under this decision the railroad companies may control a large amount of oil lands. Boring for oil, in the eyes of the Secretary of the Interior, may be an agricultural pursuit. Doubtless a Secretary of Mining would take a different view of the subject. This decision will naturally enlarge the grant to the railroad companies by limiting the right of the miner to ground containing metalliferous ores not in place, and is another evidence of usurpation of power by the Department as as it is really a grant of lands to them which Congress never intended that they should have. The theory of the law as expounded by the United States Supreme Court is that the Department has no right to grant public lands, but if this is not a grant by it of such lands what else can it be.

Yukon Placers.

The last of the miners who will come out of the Yukon country in Alaska this season have arrived at Port Townsend. The fact that such a large proportion of those who went into that country have returned without any gold is hardly apt to give the district a bad reputation in the eyes of mining men. That large quantities of gold have been discovered there can be no question, but a very small percentage of those who were lured into the country by the transportation companies obtained any of it. It is always more or less so in a rush to any newly discovered mining district. Attention, however, has been called to this case more than any other of late years, owing to the greater hardships that ensued. Fortunately, there has been less trouble in this way than was anticipated. But the experiences of those who have gone in without proper preparation have been a warning to others. The United States Geological Survey, it is to be hoped, will issue its report on the districts before the spring exodus begins. From present indications it would appear that there will be a large number going into the Yukon country again, but it is safe to predict that most of them will go better prepared to withstand hardships and to pay their own way in case of failure.

The Miners' Convention.

The fifth annual convention of the California Miners' Association has attracted more attention probably than any preceding meeting of the Association. There were gathered last Tuesday morning in Odd Fellows Hall nearly 500 delegates when the veteran president Hon. J. H. Neff called the convention to order with the following remarks:

Gentlemen of the Convention: I congratulate you and the cause of the mining industry upon this, the fifth assemblage of the annual convention of the California Miners' Association. I am pleased to see so many of you here. It assures me that the interest in this Association is not lagging or dropping, but it is increasing, and it only remains for us to be true to ourselves and true to the interests that we are advocating in order that the great mining industry of this coast may come to the fore, and, as it has been in the years past one of the leading industries, that it will continue the great prosperity of this State. (Applause.)

A Committee on Credentials, consisting of the following members, was then appointed: Judge Ira H. Reed, Calaveras, chairman; J. S. McBride, Nevada; E. C. Voorheis, Amador; E. C. Loftus, Tuolumne; Col. George Stone, San Francisco; T. J. Nichols, Placer; James O'Brien, Yuba; Col. N. E. Pickett, El Dorado; L. F. Byington, Sierra.

The convention then took a recess until 2 o'clock.

The convention re-assembled at 2 o'clock, when the Committee on Credentials reported the list of delegates properly accredited, which will be found on page 407.

President Neff thereupon delivered his annual address, which was frequently interrupted with applause, and at its conclusion three rousing cheers were given for Jake Neff of Placer. The address is published in full on other pages of this issue. Upon motion of Niles Searles of Nevada, 5000 copies of the address were ordered printed for general circulation.

Secretary Sonntag then read his report, which was as follows, with the exception of details as to receipts and expenditures:

Amount of money received from Oct. 16, '95, to Nov. 7, '96	$5,849 00
Amount expended from Oct. 16, '95, to Nov. 7, '96	5,311 11
Balance on deposit with Treasurer	$537 89

I am much pleased to note that the California Miners' Association is entirely out of debt, and the surplus on hand is ample to pay the expenses of the present convention. All the expenditures have been verified and audited by a member of the Finance Committee. Respectfully submitted,

JULIAN SONNTAG, Secretary.

A communication from the Northwestern Mining Association advocating co-operation to secure the establishment of a department of mines at Washington was read and referred to the Committee on Resolutions.

A telegram was read from Congressman-elect Marion De Vries regretting that he could not be present and asking that a copy of the proceedings be sent him.

Hon. Tirey L. Ford who had been the special representative of the Association in Washington last winter was called upon. He gave an account of the many difficulties that had been met with and of the good work he had accomplished. His remarks were frequently interrupted by applause. Mr. Ford then read the report of the Committee on Legislation of which he is chairman. The report is published in full in another column. It was adopted and placed on file on motion of Judge Walling of Nevada.

It was moved that the number of members of the committee on revision of the federal mining laws proposed in Mr. Ford's report be placed at seven to be appointed by the chairman, and it was so ordered. Judge Walling moved that the special report made by Mr. Ford be accepted, approved and placed on file, and that the gratitude of the convention be expressed to Mr. Ford for his very valuable services in its behalf, which was done, the convention rising to its feet and giving Mr. Ford three cheers.

John F. Kidder the State Debris Commissioner sent to the desk a letter from the Attorney General, answering one of his, as to the expenditure of the $250,000 appropriated by the State, and is as follows:

I am in receipt of your letter of the 16th instant, stating that the United States Debris Commission has received orders from Washington to locate and construct a dam for the impounding of debris already in the Yuba river, and that said commission wishes to know whether you are authorized to enter into a joint contract on behalf of the State of California for the construction of said dam, with the proviso that the contractor must look to the State Board of Examiners for the allowance of his monthly estimates.

I have given this matter very careful consideration, and I am of the opinion that you are not authorized to enter into any contract on behalf of the State jointly or otherwise for the construction of said dam for the impounding and restraining of debris. The act under which you hold your office and which prescribes your duties is entitled: an act to provide for the appointment, duties and compensation of a Debris Commissioner and to make an appropriation to be expended under his direction in the discharge of his duties as such commissioner. Section 3 of said act provides that whenever any board of inquiry of the United States Government shall have been appointed with power to adopt plans and specifications for the construction of works for the impounding of mining debris, it shall be the duty of said commissioner to consult and advise with such board of engineers of the United States Government to examine and pass upon the merits of such works, and said Debris Commissioner shall determine whether or not such works are calculated to and sufficient to protect the navigable water of the State, and to keep a record of such determinations. Section 4 of said act, after making an appropriation to be used in the construction of works for the restraining and impounding of mining debris, provides that "said moneys to be paid only upon orders to be drawn by the Controller upon the written request of the said Debris Commissioner, and to be drawn only for the payment of not more than one-half of the cost of construction of any such works restraining and impounding mining debris as shall have been approved by him and duly adopted and recommended by engineers of the United States Government appointed for that purpose."

These are the only duties presented by said act, and it is apparent that no authority is directly conferred upon the Debris Commissioner, nor is there any implied authority given to enter into any contract for the actual construction of the works. At the time the above act was approved and became a law, an act had been passed by Congress and approved by the President to create the California Debris Commission and regulate hydraulic mining in the State of California, which provided for the appointment of a commission to present plans and specifications of all work for the improvement and protection of the navigable streams of California, and to prevent the depositing of mining debris in said rivers and main tributaries thereof. In construing the act providing for the appointment and duties of the Debris Commission, it is apparent from the tenor of said act that the Legislature had in view the act of Congress above referred to and recognized the duty and authority conferred on the Commissioners by said act to build and construct such dams, etc., and it was the intention of said act of the Legislature of March 24, 1893, to make only an appropriation in aid of that provided by Congress and to provide for the appointment of a Commissioner whose sole duty should be to consult and advise in the adoption of plans and specifications for the construction of such works, and to see that such works when constructed should conform to the plans and specifications so adopted before any money should be drawn for the payment therefor.

The chairman in pursuance of a motion adopted appointed the following Committee on Resolutions: Fred Searles, E. A. Belcher, J. F. Halloran, J. M. Wright, Ira H. Reed, J. M. Clarken, George H. Burnham, S. J. Hendy and W. W. Montague.

The convention then adjourned until Wednesday morning at 10 o'clock.

On reassembling on Wednesday morning Col. C. L. Dignowitz of Salt Lake was given a seat in the convention as representing Utah. President Neff called Tirey L. Ford to the platform and then, on behalf of the members of the Executive Committee, presented him with a silver service set making some very complimentary remarks which were happily responded to by the recipient.

The committee's report on motion of Senator Voorheis was accepted, adopted and placed on file.

Govenor Budd, who had been invited to address the convention, being present, the president appointed Robert McMurray and Tirey L. Ford a committee to escort him to the platform. The Governor spoke as follows:

Mr. President and Members of Convention: I did not expect to have the pleasure of appearing before you to-day, though earnestly invited by your president and other members of the organization. I doubt whether I could have taken the time but for the fact that the Debris Commissioner, Mr. Kidder, a short time ago submitted to me the opinion of the Attorney General of California in regard to his duties as such Commissioner. I informed Mr. Kidder that he was mistaken as to the purport of the opinion of the Attorney General; the $250,000 that was appropriated by the Legislature of 1893 is in the State Treasury to-day and will be expended with the $250,000 appropriated by Congress at its last session. (Applause.) The Debris Commissioner's duties as defined by the opinion of the Attorney General, under the Act of 1893, are to supervise and approve the plans of the United States Engineers, and thereafter to see that the contracts for the construction of the restraining dams are properly carried out. He then reports, the matter comes on the Board of Examiners, who pass the bills; they go to the Controller and are paid by the State Treasurer. In my judgment there can be no question as to the effect of the law upon our statute book; there can be no question as to its expenditure, and if there is, it is very easy for the next Legislature to make the bill say exactly what the miners want it to say. (Applause.)

I am pleased after all these years to see accomplished that which has been attempted so often in the past. As a member of Congress I remember a bill was inherited by myself from my predecessor, and which I endeavored to pass, appropriating $500,000 for the very purpose of the joint appropriation today of Congress and the Legislature of this State. It was a bill championed then by Mr. Page, who was the miners' friend, and myself as his successor. Recently, when the bill came before Congress to appropriate $250,000, in investigating it and the laws upon our statute book I discovered, as I thought, that there would be a conflict between the two laws, and immediately I sent for Mr. J. J. Crawford, one of your members, Mr. Doolittle, another, and told them in the presence of my old friend, Dan Cole, that the result of the matter would be that you would have to change your act of Congress or you would lose your State appropriation. I knew from the law that such was the case. Mr. Cole and others called the attention of your Association to the fact. A telegram was sent by Judge Carpenter, Mr. Wright and others, and through the efforts of Mr. Ford the changes were made, so that to-day there is no conflict between the laws of the State and the United States upon the subject. (Applause.) It is needless to say that I got blistered as an enemy of the miners for ever having dared to say that there would be a conflict, but nevertheless I pointed it out, and I believe my pointing it out has resulted in some little good.

I know not what legislation may be needed, but two years ago, immediately after my election, in the Metropolitan Temple I was introduced by your good president, and then stated what I state now, that as Governor of this State any legislation proper—because you would not ask for other than proper legislation—to develop the mining industries of the State of California will not only receive my approval, but my hearty support, and all the energy that I can put behind the bill, (Applause) and two years from now when I have retired and become a private citizen, as I intend to become, because I shall not run again, I want you to understand distinctly that I will meet you here and call your attention to the fact that I have tried to do what I could for the miners of California. (Applause.)

At the conclusion of the address President Neff called for three cheers for the Governor, and the members of the convention rose and responded heartily.

The convention then took a recess until 2 o'clock.

Letters were read from Senator Stephen M. White and Congressman Loud regretting inability to be present and promising to do all in their power in Washington to secure the passage of the Mineral Land bill.

The letter from Labor Commissioner Fitzgerald was read, as follows:

I have noticed in the columns of the MINING AND SCIENTIFIC PRESS an article suggesting the necessity of the passage by our Legislature of an amendment to the present mechanics' lien law, so that the persons furnishing labor and materials in construction, development and improvement upon mining properties may be adequately protected. I therefore beg leave to state that during the last year many complaints have been filed with me based upon the loss of pay by miners who save not been properly protected, and I sincerely hope that some action may be taken by the Miners' Convention toward recommending an amendment of this character to the Legisature.

As the Miners' Convention represents the combined mining interests of our State I feel that such a recommendation will meet with the hearty approval of the legislators, and result in unmeasured benefit to those interested.

Trusting that the convention in its wisdom will undertake this action I have the honor to remain, Yours, very truly,

E. L. FITZGERALD, Labor Commissioner.

Harold W. Fairbanks of the State Mining Bureau read a paper upon the proposed division of the work of the bureau into a mining and a geological department, as suggested by J. J. Crawford, the State Mineralogist, in his annual report, and gave an interesting account of what had been accomplished and what could be done in the future for the good of the miner by a thorough geological survey of the State. A vote of thanks to Mr. Fairbanks was passed and 1000 copies of his paper were ordered printed.

Mark B. Kerr made some remarks in connection with the same subject, and particularly advocated a resolution, which was later adopted, in favor of topographic and geologic maps more in detail and more available to the miner.

President Neff stated that he wished to say a word as to those who were connected with the mineral exhibit of the Midwinter Fair and especially to thank the committee, which was composed of Professor S. B. Christy, Edward Coleman, Edward H. Benjamin, W. C. Ralston, Frank McLaughlin, J. J. Crawford and S. K. Thornton. Professor Christy, he said, was especially active in bringing out and exhibiting the mineral resources of the State.

W. C. Ralston, chairman of the Committee on the Preservation of Mineral Lands, reported that, owing to the failure to pass the Mineral Land bill, the committee had no duties to perform and no report to make.

The Committee on Resolutions presented the following report:

SAN FRANCISCO, Nov. 11, 1896.

To the President and Members of the California State Mining Association.—GENTLEMEN: Your Committee on Resolutions beg leave to respectfully report as follows. The following resolutions were adopted:

Resolved, That we look upon the State Mining Bureau as one of the important factors in the advancement of the mining industry of California and urge upon our Legislature the necessity of providing for its continued proper maintenance and support. The reports and bulletins are not only directly useful to the miners of the State, but also serve a good purpose in attracting the attention of people of other States and countries to the advantages to be gained in following the business of mining in California.

Resolved, That the president and vice-president of the Board of Trustees of the State Mining Bureau and the State Mineralogist and the professors of mining and geology in the University of California be made honorary members of this Association, and that they and each of them be entitled to seats as delegates to the present and future conventions of this Association.

Resolved, That the California Miners' Convention indorses the plan of having the State Mining Bureau co-operate with the United States Geological Survey to make a topographic and geologic map of the mineral regions of the State of Cali-

fornia, county by county, on a scale of 200 feet to one inch.

Resolved, That the California Miners' Association do urge upon the Legislature of this State, at its session commencing in January, 1897, the repeal of those certain acts, as follows, to-wit: 1. An act entitled "An act for the better protection of the stockholders in corporations formed under the laws of the State of California for the purpose of carrying on and conducting the business of mining," approved March 30, 1874, and relating, among other things, to the furnishing of verified weekly and monthly statements by the superintendent and monthly verified statements from the secretary and president of incorporated mining companies. 2. An act entitled "An act for the further protection of stockholders in mining companies," approved April 23, 1880, and preventing the directors of any mining corporation to sue, lease, mortgage or otherwise dispose of the whole or any part of the mining ground owned or held by such corporation, or to purchase or obtain in any way any additional mining ground unless such act be ratified by the holders of at least two-thirds of the capital stock of such corporation.

Resolved, That a committee of three, to be residents of San Francisco, be appointed by the president of this convention, the duties of which committee shall be to examine and carefully consider what legislation may be necessary for the benefit of the mining industry of this State, either in the way of amendments to existing laws or as new laws, and that said committee report to the incoming Legislature in writing, through the appropriate committees, with such recommendation as said committee may make: *Provided, however*, That all such proposed legislation shall first be submitted to the Executive Committee of the California State Miners' Association for their approval.

Resolved, That all persons having amendments to existing laws or new legislation in the mining industry of the State be invited to communicate with said committee.

Resolved, That the members of this convention make it their individual duty to advise and consult with the legislators of their respective counties, and urge upon them their friendly offices in behalf of such friendly mining legislation as may come before them for consideration.

WHEREAS, Transportation facilities are of paramount importance to the success of all mining enterprises; and

WHEREAS, The present road system of this State is entirely unsatisfactory and totally insufficient for the successful development of our mineral resources, therefore be it

Resolved, That this convention heartily indorse the movement for good roads, as evidenced by the creation of the State Road Commission, and we do ask for immediate legislation for the betterment of our public highways.

Resolved, That a committee of three be appointed whose duty it shall be to confer with the California Debris Commission, the State Debris Commissioner and the Attorney General in regard to the construction of the debris dam, said committee to be under the direction of the Executive Committee.

Resolved, That the thanks of this convention be and they hereby are extended to the members of the Congress of the United States who have aided the miners of California in efforts to secure needed Federal legislation.

Resolved, That the thanks of this convention be and they are bereby warmly expressed toward the newspapers of this State, and the newspapers of San Francisco in particular, and as well toward the people of San Francisco, for their hearty support and encouragement of this Association and its purposes.

Resolved, That a committee of three be appointed to consider and report upon the subject of a hospital for disabled miners.

Resolved, That the California Miners' Association strongly and urgently desires the appointment of a Cabinet officer to known as the Secretary of Mines and Mining.

Resolved, That, in the judgment of this Association, it would be desirable that the Governor of this State in appointing Regents of the University of California take into consideration the importance of the mining industry of this State and consider the advisability of appointing a competent miner as one of the Regents of that institution when opportunity offers.

The following is referred to the Legislative Committee of the California State Miners' Association:

Resolved, That the proposed legislation supplementary to the Federal mining law, concerning locations, etc., and also amending Section 14 of Article I of the State Constitution, and amendatory of certain provisions of the Codes of this State and also of the federal mining law, defining what shall be subject to placer entry, as follows, to-wit:

1. An act relating to the location, re-location, manner of recording lode and placer claims, mill sites, tunnel rights, amount of work necessary to hold possession of mining claims, and the rights of co-owners therein.

2. An act to amend Section 605 of the Penal Code of the State of California, relating to the removing, defacing or altering of land marks.

3. An act to amend an act entitled "An act supplementary to an act entitled 'an act concerning crimes and punishments,' passed April 16, 1850, amended March 20, 1872."

4. An act relating to the purchase of ores and other valuable mineral products.

5. An act to amend Section 1183 of the Code of Civil Procedure of the State of California, relating to the liens of mechanics and others upon real property.

6. Senate Constitutional Amendment No. ——: To propose to the people of the State of California an amendment of the Constitution of the State, amending Section 14 of Article I of the Constitution in relation to eminent domain.

7. An act to amend Section 2329 of the Revised Statues, relating to placer claims,

Be indorsed by the California Miners' Association in convention assembled, and, further,

Resolved, That a committee of three persons be appointed by the chairman to take all proper and necessary steps to secure the passage of said bill and the presentation of said constitutional amendment by the Legislature of this State at its session commencing on or about Jan. 4, 1897.

The communication of Attorney General Fitzgerald to State Debris Commissioner John F. Kidder is returned for the consideration of the convention. All of which is respectfully submitted. FRED SEARLES, Chairman.

J. F. HALLORAN, Sec'y.

On reassembling Congressman Barham addressed the convention and in the course of his remarks said that he believed that the Mineral Land bill would pass at the short session of Congress. He promised to do all he could for the mining industry.

A letter from Hugh Craig, president of the Chamber of Commerce, was read. He offered a suggestion that the University of California issue degrees to non-resident students upon passing required examinations, and that mining companies provide for an accident insurance for the working miners.

Nomination for president of the Association being called for Hon. Niles Searles, in placing upon the Convention the name of Mr. Neff, said in part:

The success of this organization and of this society is more due to the influence, to the good judgment, to the honesty and integrity of Jacob Hart Neff than any other one man. (Applause.) I know that he has served his probation and feels that he ought now to gracefully retire—he would not say so, but I will say—upon the laurels which he has so well won. But we are still upon the up-grade, and I feel as most of you feel that we still need him as the leader, that we still need him to handle the drill until we reach the dead level of success. (Great applause.)

Gentlemen of the Convention, I therefore nominate as the president of this society for the ensuing year Jacob Hart Neff. (Great applause.)

Mr. Neff was chosen by acclamation, the whole audience rising to their feet and giving three cheers.

Mr. Neff briefly addressed the Convention as follows:

Gentlemen of the convention, as has been well said by my distinguished friend, Judge Searles, I had ardently hoped that some other person might be selected to take charge of the Presidency of the Miners' Association. But I, standing here in the presence of this distinguished assemblage of miners, cannot find my heart hard enough to decline the honor that you now again confer upon me. (Applause.)

I have not been insensible in the past for the honors that I have received from the miners of this State, and as I look into the countenances of those who are here to-day it impresses me more firmly—I am convinced more firmly—that our work is progressing and passing on to eventual success. I am here as your servant to carry out your wishes, and so long as life endures, whether as your president or as humble follower in the ranks, I will be with you heart and soul, and my best efforts shall be used in the furtherance of the organization of which you are members. (Applause.)

I owe to my very distinguished friend, my old time friend, my thanks. I think his eulogy of me perhaps in some respects was somewhat overdrawn. I do not claim to be a first-class orator, nor a first-class presiding officer, but what I have done has been done to the best of my ability. What I have said usually comes from the heart. I feel what I say, and now while entering upon the discharge of my duties for another year I will pledge you my individual efforts for the furtherance of the objects of the Miners' Association of California. I thank you one and all for this testimonial of your regard. (Applause.)

Samuel K. Thornton was chosen by acclamation to succeed himself as Vice-President, as were W. W. Montague as Treasurer and Julian Sonntag as Secretary.

The President called upon Professor S. B. Christy of the State University to say something of the College of Mines at that institution. Mr. Christy said in part:

Mr. President and Members of the Miners' Association of California: A great many of the friends of the University of California have felt that the institution has been too modest in presenting its needs to the people of this State, and while modesty is universally recognized as no drawback in a man, still when it comes to institutions, particularly State institutions, there may be different views upon that subject.

One reason why the University of California should commend itself to all the citizens of this State is that it is endeavoring to educate producing citizens, and it seems to me that that is the one essential thing in the permanent success of any State.

I remember that General Barnes, some years since, made a very exhaustive investigation as to the condition of the working classes, in this city in particular, and he found that nearly all the workmen—the skilled as well as the unskilled workmen—were very largely foreigners, and that the native born young men were not very well represented among the working classes. The tendency in this direction has been noted for a long time by those who have at heart the welfare of this State.

I wish to call your attention to the fact that the University of California is doing what it can to offset this tendency. The old idea of a university was a place where nothing useful was taught, but the modern idea, the idea that Ezra S. Cornell first clearly enunciated, is a university is a place where anybody can learn anything.

I wish to call your attention to just one side of the work that naturally would interest this association most, namely, the one in which I am personally most interested. There are two sides to mining work, the one is the reduction of the ore, the other is the extraction of the ore. As to the first, we have been able to reach the practical side of it, through the munificence of the Legislature, which has allowed us to erect a well equipped stamp mill. We have a large number of machines which enable the young men to go through all the work of treating ore just exactly as it is done on a large scale. When it comes to mining work, however, it has been a very difficult problem, to know how the practical part of the work could be incorporated into a college course. I have, however, recently succeeded, I think, in making a successful attempt in this direction. For several years we have had a class practically instructive in one of the principal duties of the miners' task, namely, the attack of rock, the operation of drilling, of blasting, sharpening and tempering drills. All this work is now, and has been for some years, conducted in a practical way, and every man in the class is able to sharpen a drill, to harden and temper it, and then to use it. I think that all of you could see these young fellows at their work, cheerfully, could feel that there still was some hope that the young men of California might be able to procure their living by productive labor. (Applause.) I regard this simply as a beginning. I look to them putting in each of their summer vacations in the practical work of the mine. In this matter I have been ably seconded by a large number of members of this association, and scattered all through the State, the boys have been putting in their vacation, and I feel sure that so far as that side of the university work is concerned, you can count on its helping to make self-supporting citizens. (Applause).

Another thing that may possibly interest some here is a very brief announcement of some work in the mining department in the last four years, in regard to the cyanide process. A large field is open; a great many things are yet to be found, and we have already found a large number through the assistance of the students. It would take hours to enumerate the important and interesting things that have come up. I hope to soon have it in print. A number of new methods of precipitation have been discovered, and I will say in general that it seems to me not unlikely that the usefulness of this method may be extended largely beyond what has yet been reached: and this much is certain, that any mine owner who is discharging tailings averaging over 50 cents a pound would do well to save them. I know Mr. Edward Coleman said to me last night that he only wished he had the tailings that the Idaho mine had sent down the creek in the years gone by; that it would be a fortune to him. At that time there was no way known of saving any more gold than they did. How many other fortunes have gone down that might have been saved! It seems to me that, from now on, those in charge of mills ought to impound their tailings if they run anywhere over 50 cents per ton.

I want to say one word more. Is there a need for help at the University? There is a great one, and let me explain how the situation is. One of our professors, in the History Department, has recently compiled a number of statistics that are quite surprising. It shows that in nine years the attendance at the University has gone from 300 to 1500 students, 500 per cent in nine years; that the increase has been four times as great as the increase in the population of the State. The resources of the University have not grown in proportion. The income of the University is largely derived from a tax known as the one cent tax, which is a tax of one cent on the hundred dollars. This increase in nine years has been only 47 per cent. Our students have increased 500 per cent. In short, we are now attempting to do four times the work that we formerly did with the same amount of money. We are at every side pinched and cramped. We are crowded for room. To give one example; for a class of sixteen men, I wanted at least four forges; we only had one. We had to make the others ourselves out of wood and clay and stone. We need more anvils than one, and we had to take an old T rail, which the boys have been hammering on for the last two years. This is so in every department of the University. There is need for more money, need for more help

One word more and I am done. The Legislature will be appealed to, no doubt, to help us in this matter, in the way of an increased tax. What does this amount to? It has been calculated to amount to just the sum of 8 cents per year for each citizen in this State. Now, I say to you, gentlemen, generous miners of California, this is so little to you, and how much does it mean to untold numbers of young men and young women? Is it not a good investment? I remember Huxley stated some years ago that all the money that England had spent on the cause of education, from the time of Sir Isaac Newton down to the present, had been amply repaid by the education of one such man as Faraday. The electric lights that illuminate this building, the electric plants furnishing power to mines throughout this State, the numerous inventions that have glorified the end of this century, have all come from the brain of the man Faraday; they are all the evolving of ideas originating in his mind. So I think that what Huxley said is true: so I think that one such man as that to be reproduced from the University would amply repay all that we could give for a hundred years.

Col. C. L. Dignowitz of Salt Lake delivered an interesting address on the mineral resources of Utah.

Mr. Mason of Nevada stated that he had received a letter from Grove L. Johnson, in which he says that his sympathies were still with the miners and that he would work in their behalf in the coming session of Congress.

The chairman said that Senator Perkins was too ill to appear, but desired to express his unbounded confidence in the cause in which they were engaged and to say that he believed that they were just entering upon the most important epoch in the mining history of the State.

The chairman announced that the members of the Executive Committee and other important committees provided for by the convention would be appointed after the adjournment.

The committee to assist the secretary in formulating an address in communication to the various mining associations and organizations asking their assistance in securing the establishment of a Department of Mining at Washington, was amended as follows: Charles G. Yale, W. C. Ralston and S. K. Thornton.

President Neff then said:

Gentlemen of the Convention: I desire to again congratulate you upon the happy termination of this session of the Miners' Association. It has been one of the most successful, the most largely attended, and the most enthusiastic convention that we have ever held in this State, and it appears to me now that the cause is properly launched on the ocean of success, and that in the future we may greet each other as we have in this session, come together, legislate for the mining industry, and go home in peace.

A motion was made and duly seconded that the convention adjourn sine die, and was carried.

Concentrates.

H. W. FOWLER of Chicago will erect a large matte smelter just north of Ouray, Colorado. It is expected to be in operation early in the spring.

THE mill of the North Mountain Mining Company at Egan, in the White Pine district, Nevada, is treating fifty tons a day by the cyanide process.

THE Horsefly Mining Company, on the south fork of Quesnelle river, Cariboo, B. C., contemplate the abandonment of the hydraulic system because of the cemented character of the deposit, and propose to erect a 20-stamp mill next season.

THE total output of the Cripple Creek district from 1892 to 1895, inclusive, was $13,700,000. It is expected that this year's output will reach $10,000,000, making a total of $23,700,000. It is claimed that of this year's output $3,500,000 will be net profit to the owners.

AT a meeting of the Placer County Miners' Association, held at the Palace Hotel Nov. 11th, the following officers were elected to serve for the ensuing year: Hon. Harold T. Power, president; M. T. Lawrence, vice-president; Ivan H. Parker, secretary; T. J. Nichols, treasurer.

IT is claimed that the output of gold in the Black Hills will amount to $12,000,000 this year. There is no large mining district in the country that will not produce more gold than it did last year, and the total yield of the United States promises to far outstrip that of any other country.

W. T. GRISWOLD of the United States Geological Survey is in Salt Lake, where he will be joined by other members of the corps during the next few days, when they will go to the Tintic mining district, where a topographical survey will begin, to be followed by inquiries into economic conditions next spring.

THE smelter and sampling works at Salt Lake all report a falling off in the tonnage during October, and without improvement in the metal market a large number who are dependent on the mines and mills for a living must content themselves with short rations during the winter. The most notable diminution in the output is reported at Bingham, where for days not a single car of ore has been hauled out. Yet in few of the mineral fields has there been proved up so many valuable big properties during the past few months as in Utah. All the while the blocking out of ore goes forward at all the camps, and it is admitted that they are to-day capable of producing more under favorable conditions than ever before.

President Neff's Address.

The following is the address of President Neff to the State Miners' Convention:

Fellow Miners and Members of the Convention: This annual assemblage of the representatives of the mining industry of California, entirely unpolitical and non-partisan in its character, is one of great importance, not only to this State itself, but to all others where precious metal mining is carried on. Circumstances forced us to take the lead in California in forming the first Miners' Association in the United States, entirely free from all questions relating to labor troubles, or strikes or wages, and devoted solely to the general interests in mining and the remedying of such existing evils as were detrimental to the industry. It is true that the original purpose of the organization was to endeavor to rehabilitate mining in our own State, but it was soon realized that the objects of the Association must be broadened; and in so widening the scope of our work we were enabled to accomplish objects of benefit to all miners, whether pursuing their occupations in California or other States of the Union. In this way we were in a position to demand and receive the assistance before Congress of the representatives from other mining States, through which means more has been accomplished than had we carried on our work single-handed. Within the past two years another Miners' Association, similar to ours, has been placed on a working basis in the northwestern States, including Oregon, Washington and Idaho, and our fellow miners in those regions are prepared to co-operate with us and assist in carrying out any proposed measures. With the backing of the thousands of miners forming these associations we are in a position to receive a respectful hearing before Congress or Legislatures, with some reasonable expectation of having what we ask granted.

Before the formation of this Association the individual miner was left to his own resources. No matter how much cause of complaint he might have had or under what injustice he might be suffering, his single-handed efforts before the Courts, the Legislatures, the Land Offices or Congress, were scarcely heeded and he could accomplish nothing. One man fighting for relief from obnoxious laws or Department rulings, and demanding a change, would not be recognized as representing an industry; but when all of the class identified with that industry band together in a common cause, and, through these representatives demand relief, the Department, the Legislature and Congress itself *must* listen to their appeals and give consideration to their requests. Under these circumstances the American people, who are more powerful than these bodies of their own creation, will make themselves heard where the cause is just, as was ours, and their influence materially aids in the accomplishment of the desired ends.

Believing as I do in the future of this organization and its continued power for good to the mining industry, I have thought it proper to recite as briefly as may be some of the facts connected with its earlier history and formation, since I am familiar with them from the fact of having had what I consider the distinguished honor of having been chosen chairman of the first meeting in Placer county, where the start was made, and the first president of the resulting California Miners' Association. Being about to retire to the ranks and leave the leadership in abler and younger hands, it is well to call the attention of those of you who have swelled our ranks to thousands, from a mere corporal's guard, to the condition of affairs as it was when we began, and to those persons through whose early efforts this great Association was made possible.

In 1891, Thomas B. Everett, a Placer county miner, who, like some thousands of others, had been having hard times of it since the closing down of the hydraulic mines, suggested to J. A. Filcher, editor of the Auburn *Herald*, the idea of calling a miners' meeting at Auburn, with a view of holding a county miners' convention and ultimately one of the miners of the whole State to consider the condition of the hydraulic miners, and, if possible, afford them some relief. On the 18th of November, 1891, this meeting was held and resulted in the Placer County Miners' Convention at Auburn, November 28th, to prepare for a State convention to be held on January 20, 1892.

Among other things a committee was appointed to issue an address to the people of the State, calling attention to the deplorable condition of the mining industry and the measures of relief desired. This important committee consisted of Russell L. Dunn, Dr. M. Schnaeble, J. M. Fulweiler, Geo. H. Colby, J. B. Hobson, J. A. Filcher, J. H. Neff, Chas. G. Yale, Dr. N. Martin, D. W. Spear and Amos Stevens. After two days' work the address was issued for publication in the newspapers. It was an appeal to the people of California in behalf of the miners' cause and had the effect of creating a favorable impression, which was borne out by the results of the State convention.

The standing executive committee of Placer county was given full power to promulgate the call and make the arrangements for the State Convention. This committee consisted of Chas. G. Yale, John B. Hobson, B. F. Hartley, John Spaulding and myself. It so happened that Mr. Yale, who was at that time editor of the MINING AND SCIENTIFIC PRESS, was the only man from San Francisco who attended the Placer County Miners' Convention and he was placed upon the executive committee and entrusted with organizing the work in San Francisco. It was realized that, without the aid of the people and the press of the metropolis of California, little or nothing could be accomplished. It shows what the general feeling was at that time against hydraulic mining when it is stated that it was only with the greatest difficulty any one could be induced to take any leading part in the movement to rehabilitate it or give it any countenance whatever. Mr. Yale was greatly aided in his missionary work by Wm. C. Ralston, Robert McMurray, Thos. R. Church and a few others; but, though many promised support at the first meeting held to consider the subject, there were only sixteen men in this great city who attended or paid any attention to the matter. Just think of it, gentlemen! In a State founded on its gold mines, in a great city built by the gold mines, filled with millionaires and merchants who had made their fortunes in mining, only sixteen men could be found at that time who were willing to come forward and lend their names and influence toward rehabilitating a branch of the industry, fallen into decay through adverse judicial decision, and which had formerly poured ten millions of dollars in new gold annually into the channels of trade in this city. Here was an investment of one hundred million of dollars lying idle in our midst, unproductive, unused and valueless. We were not about to ask to recommence our operations on a former basis and permit our tailings to go where they would, into the rivers or on the farming lands. That time had passed, and no one recognized it more than ourselves. Poverty, distress, loss of property, litigation and bitter controversy were hard schools of experience, but had been ours. Idle men, deserted mining camps, crumbling ditches and reservoirs, rusted pipe lines, empty dwellings, abandoned diggings and the almost depopulation of what had been formerly prosperous mining sections, had brought despair to thousands throughout the mountains of California. Their only gleam of hope lay in a recently published report of a commission of Government engineers, the first favorable sign for years of the possibility of a resumption of operations in the hydraulic mining regions. They were about to meet together to ask the people of the city and the State for their assistance before Congress in favor of measures looking to the relief of this great industry, once so productive, now fallen into decay. And yet what a beggarly gathering in numbers was this first meeting in San Francisco to inaugurate such a movement. It is scarcely conceivable in the line of what followed and was discouraging in the extreme.

So bitter had been the controversy on the debris question and so long continued the litigation that a strong prejudice existed against the hydraulic miners, which was strengthened by their having lost the fight in the courts. The great opposing influence of the successful and powerful Anti-Debris Association of the valleys had fostered this prejudice and increased it. The growth in power and wealth of the agricultural industries of the State and the decadence of the mining industry, due greatly to the enforced closing down of the mines, had caused many to throw their influence against the miners' side. The press was either actively opposed to the miner, or silent regarding him and his industry. Public opinion was not in his favor. It was thought that agriculture and horticulture had almost entirely supplanted the search for gold, and these were the reasons for the small success of our first efforts in San Francisco.

But those who had the work in hand were not dismayed. As one who was appointed a delegate from San Francisco to the State convention declined or a few dropped aside others were chosen in their places until finally the full quota was obtained. In the mountains they were eager to come and no man refused, for they realized all there was at stake.

Finally, on January 20th, 1892, the first State Convention of the miners of California was held in San Francisco and was an overwhelming success. There was a complete revulsion of popular feeling. Even our old enemies, the valley men, held out a helping hand on becoming convinced of the sincerity of our intentions, and our desire to resume the mining work only where the conditions were such as to permit it being carried on without material injury to the navigable streams or the lands along the banks. The resolutions and memorial adopted by the convention were dignified and conservative, recognizing the rights of others as well as our own; and the speeches made by prominent men were of a nature to assure the public of the cessation of a long-continued controversy and an amicable settlement of existing differences. Care was taken in the appointment of the more important of the committees to select conservative men, and place upon them not only the miners, but representatives of the valley interests as well, that there should be full and free discussion of the subject and that both interests should have voice in our deliberations. That the course and policy were the best was proven by the results obtained. As an instance may be cited the case of the Committee on Memorial, charged with the duty of preparing a memorial to Congress, in which the hydraulic mining situation in California should be set forth and measures of relief suggested. This was the important committee of the convention; for, unless a memorial could be drawn which would be satisfactory to men of both mountain and valley, their differences could not be well adjusted at that time, and controversy instead of amity would result. This committee consisted of twenty-five members, miners and anti-debris men being both represented. After a long discussion of the facts involved, it was finally decided to select two men, one representing each interest, to draft this important document, and they were left by themselves to do this work, the rest of the committee retiring. Mr. Robert T. Devlin of Sacramento, the attorney of the Anti-Debris Association, was selected on the part of the farmers and Mr. Charles G. Yale of San Francisco to represent the miners of California. It was the first time in years that the representatives of these two contending factions had been brought together on friendly terms and with a common object in view. So amicably and well was the work performed that the committee reported favorably on the memorial at once, and the convention adopted it unanimously. It was the expression not only of the miners of California, but of the farmers as well, and formed the basis for the measures of relief enacted by Congress which once again set our ditches flowing, our giants spouting, opened our golden streams and rehabilitated the almost dying hydraulic mining industry of California.

Unity of action and fair-mindedness achieved a victory where individual effort, controversy and litigation had failed. Of almost equal importance was the Committee on Resolutions, which should tell the people of the State what our intentions and desires were and how we expected to accomplish our ends, and, moreover, another important committee was to arrange for the permanent organization of the California Miners' Association. I want to recall to you here present the names of the chairmen of these three representative committees of our first convention, because so much depended on their work and because they did it so well: Mr. C. W. Cross was the chairman of the Committee on Resolutions, Mr. Tirey L. Ford of the Committee on Permanent Organization and Mr. Charles G. Yale of the Committee on Memorial to Congress.

When our first convention adjourned and we organized the California Miners' Association, we at once realized that we had the assistance and moral support of the people and the press of the State. We were given a backing far beyond what was even expected. The Chamber of Commerce, the Board of Trade and Board of Supervisors of San Francisco passed resolutions endorsing our memorial and our object, as did the Boards of Supervisors throughout the interior counties. The merchants and manufacturers of this city were wonderfully liberal in their donations of needful money to carry on our work, and money came from other places as well. The different County Miners' Associations responed liberally to our call for financial help, and the California Miners' Association was fairly and successfully launched with public favor enlisted in its behalf.

For these results we are largely indebted to the press of this city and State, for had it not viewed our efforts with favor, we could not have gained popular approval. To the editors of California the miners of the State owe a debt of gratitude almost beyond measure. The MINING AND SCIENTIFIC PRESS, particularly, has always been our friend. And the miners are under heavy obligations, also, to certain gentlemen in this Association, who fought early and late in their behalf, without expectation or desire for reward. As your President, and a member of the various working committees, I know that our object could not have been carried out without their active and intelligent assistance. It would be impossible to name all who have been helpful to us in carrying on the executive work, or upon whose advice and assistance I have so largely depended. But prominent among them have been your secretaries, William C. Ralston and Julian Sonntag. Both of these gentlemen have performed a great amount of gratuitous work for the Association, for which we owe them our hearty thanks. Both have been enthusiastic in behalf of the cause and tireless in their efforts. We have had the best of legal talent to aid and counsel us in our labors—all without compensation of any kind—and I desire to return my sincere thanks to them for the many favors conferred on me as your President. During our early organization Mr. C. W. Cross gave us most material aid in many ways, suggested by his professional experience and knowledge relating to hydraulic mining and the litigation connected with it, and he continues to assist us to-day. Tirey L. Ford, as Chairman of the Committee on Legislation since we commenced our work, and as our representative before Congress at the last session, has been absolutely untiring in his zeal for the interest of the miners of the State. It is unnecessary for us to elaborate on his report and the valuable information it contains, for copies have been placed in the hands of each of you. Mr. Ford's individual work in our State Legislature has given us laws of the utmost importance to the hydraulic miner, and his advanced assistance has been freely given on all

occasions. Mr. A. H. Ricketts did a splendid work for us, as chairman of the Committee on Mineral Lands, as our attorney in Washington, and freely donated a large amount of his valuable time to our cause. Among other attorneys who have materially aided us with their gratuitous professional advice are J. M. Wright, E. A. Belcher, J. M. Walling and J. M. Fulweiler.

We should not forget ex-Governor Markham, who, as the Chief Executive of this State, first called the attention of the Legislature and the people of California to the deplorable condition of the hydraulic mining industry and suggested that measures of relief be instituted. The gentleman who acted as manager of our successful mineral exhibit at the Midwinter Fair—Mr. Edward H. Benjamin—also placed us under lasting obligation for the use of his name in the protests to prevent the railroad companies from patenting mineral lands.

In the early days, when we were struggling hard with the Caminetti act, Niles Searles, John Hobson and Robt. McMurray fought ably for us before the committees of Congress. In the collection of necessary funds, we have been greatly aided by Samuel K. Thornton, Louis Glass, W. W. Montague, Dan T. Cole and others. The Board of Trade of San Francisco, more than any other single body, has advanced our financial interests and helped bring light to many dark days with us. Among other active and tireless workers in our behalf have been John McMurray, Harold T. Power, Thomas R. Church, Edw. Coleman, Andrew Carrigan, S. B. Christy, S. J. Hendy, Chas. F. Hoffman, J. P. Parks, R. R. Grayson, E. C. Loftus, Henry Pichior, Felix Chappelet, R. C. Hart, E. W. Chapman, W. R. Thomas and James O'Brien.

I should be derelict in my duty did I not mention especially the very intelligent and constant services performed by one who is best known to us all as Charlie Yale. As one of the organizers of this movement in behalf of the miners of California, he has been one of my most valued assistants on the Executive and other important standing committees, has never faltered in his zeal, and never failed to do any amount of work for which we called upon him. With a thorough knowledge of the subjects before us, and a ready pen, he has not only greatly assisted us in the preparation of numerous important documents, resolutions, etc., but has ably fought our battles in the public press and helped to enlist its influence in our behalf. The conservative and successful policy carried out in the administration of our affairs is largely due to his advice, and method of bringing them before the public in the beginning. I freely acknowledge my own obligation for his valuable assistance in many ways and assure you he deserves the thanks of this Association of the miners of California.

I undertake to say that no organization has ever accomplished such important results with such small expenditure. No officer of the Association has received one dollar from the treasury for professional services, nor has any one else connected with the management of its affairs.

Being about to retire from the presidency of your Association, I have thought it my duty, as it is my pleasure, to recall to you the names of those more prominent in the conduct of its affairs in the past, since I have been in a position to see and recognize the services they have performed. I desire to return my sincere thanks to all of them for the many favors extended to me as your president, and thank them also in behalf of the Association to whose success they have so largely contributed. As to the future of this Association, I have every confidence in it. There are many measures which will be of benefit to the mining industry of the State which still demand consideration at your hands. Prominent among them are the needs of a representative of the mining industry in the councils of the nation, for there should be a Secretary of Mines in the Cabinet, that our large and growing interests should be guarded. Moreover, closer at home there should be in the State University, where there is already a College of Mines and Professors of Mining, one or more representatives of the mining interests in the Board of Regents. You should continue to lend your moral support and influence to the maintenance of the State Mining Bureau, which is now doing useful work in behalf of the mining industry of the State. This institution should be fostered and encouraged in every way by all of us. In Congress let us not falter or hesitate. Public opinion is with us in this matter and Congress has been "educated" on the question. The measure cannot fail of passage. We only ask that the railroad companies be prevented from acquiring any more mineral lands in this State, which were, by their land grant, expressly reserved for the miners. Other lands are given them, for such mineral tracts are set aside so they have no real cause of complaint. It is but just that the mineral lands, set aside as the domain for the miner and prospector, should be kept for them as intended, and it rests mainly with this Association to contest the false claims of the railroad companies, have the lands properly classified, and leave the mineral for the prospector of the future, for whom Congress plainly intended it. Numerous changes in the mining laws seem necessary for the protection of the miners' interests and the proper conduct of their business. All such proposed amendments should be carefully considered by your Committee on Legislation before receiving the indorsement of this Association in order that when our requests finally come before Congress they shall have been thought out and properly represent the desires of the miners of the State.

We are now in a better condition to accomplish our ends than ever before. The Association is out of debt, and though we have no available funds, they will doubtless be forthcoming when the necessity arises. The Mineral Lands bill which failed of passage at the last session of Congress is on file as "unfinished business" and will come up for consideration at the next session in December. It can surely be passed if our members in the House of Representatives will take the matter in hand promptly. The appropriation of two hundred and fifty thousand dollars by the State and of another two hundred and fifty thousand dollars by Congress are now available and being expended in the improvement of the rivers and the construction of dams to prevent further encroachment of the debris now in the streams upon the navigable portions. Many hydraulic mines are now being operated under the provisions of the Caminetti law, and their number is daily increasing. We have now a State Debris Commission, which is co-operating with the Federal Commission in the conduct of the work of rehabilitating these mines. All these things are the direct results of the efforts of this Association.

I am sure that we ought to feel somewhat proud of the result of our efforts in behalf of our chosen industry. Our experience shows that it only needed united effort to accomplish what was at one time supposed to be almost impossible. The public and and the press, then misinformed, only needed to be intelligently told of the true condition of affairs and what was necessary to remedy them, when their sympathies were at once enlisted in our behalf and we received their active assistance and influence. And gentlemen, we have been true to our promises. We have so succeeded in conducting the hydraulic mining business as to work no injury to any man or any interest. We have asked for no radical changes in the law, but simply pressed the enforcement of those existing. Those for which we may ask in the future are simply such as experience shows are necessary for the progress of the mining industry. They will interfere with no one else's affairs in any way and only relate to methods of conducting our own business.

I have great faith in the future of the mining industry of California. This great industry is now advancing with rapid strides and increasing its products between two and three millions of dollars every year. Those noble mountains which overlook our great valleys and form the backbone of the State, are daily yielding their golden treasures to the enrichment of us all. More still remains hidden than has ever been taken out, and there is work for the sturdy miner for years to come. The blows of his pick will resound and re-echo through those grand old canyons and ravines long after all of us here present shall have passed from the scene of our labors. Let us hope that the work that we have accomplished, and what we are to do to-day, will bring results from which the miner of the future will derive a benefit, and cause him to pause in his work, and thank the Miners' Association of California for what it did in his behalf.

Report of the Committee on Legislation to the State Miners' Convention.

To the California Miners' Association—GENTLEMEN: Your Committee on Legislation begs leave to make the following report:

Your committee begs to refer to its report made to the Association upon the occasion of its last annual convention in October, 1895.

Since that time there has been no meeting of the Legislature of this State.

The Fifty-fourth Congress, however, met in regular session in December, 1895, and continued in session until June, 1896. Your committee, acting under instructions from the Association, presented to Congress four measures for the consideration of that body. These measures were:

1. A bill intended to reduce the penalties provided for in the so-called Caminetti act, being officially entitled: *A bill to amend an act entitled "An act to create the California Debris Commission and regulate hydraulic mining in the State of California," approved March 1, 1893, by amending section twenty-two thereof.*

2. A bill intended to amend the Federal mining laws, with particular reference to the manner of locating, holding and working mining claims, and the transfer of contests as to the agricultural or mineral character of land from the land offices to the local courts, being officially entitled: *A bill to amend chapter six of title thirty-two of the Revised Statutes, relating to mineral lands and mineral resources.*

3. A bill looking to the segregation of the unpatented mineral lands within the railroad land grants in California, locally known as the Mineral Lands bill, and officially entitled: *A bill to provide for the examination and classification of certain lands in the State of California.*

4. *A bill to appropriate money for the construction of works to impound mining debris, and thereby to protect the navigable streams of California.*

For an account of the action taken by Congress upon the above measures you are respectfully referred to the report rendered by your representative in Washington, under date of June 30, 1896, entitled: Report of Hon. Tirey L. Ford in relation to his services at Washington in 1896, in behalf of certain mining legislation, which has been printed for distribution among the members of the Association.

Your committee is of the opinion that, with proper efforts, the so-called Mineral Lands bill above referred to should become a law during the approaching session of Congress, which begins in December and ends in March next.

In addition to the work necessary to secure the final passage and approval of the Mineral Lands bill, your committee deems it advisable that whatever doubts now exist as to the availability of the appropriation made by the State of California through the Legislature of 1893, should be removed at the approaching session of our State Legislature in January next. The National Congress having made an unconditional appropriation which fairly meets the terms of our State appropriation, the State can now well afford to so amend the wording of its appropriation as to eliminate all conditions and contingencies therefrom. This to your committee appears to be of considerable importance, and should engage the earnest and immediate attention of the Association.

Your committee furthermore begs leave to renew its former suggestions, that our Federal mining laws should be so revised as to make them not only harmonious but in keeping with the changed conditions since their original enactment. In this behalf your committee begs leave to suggest that a work of such importance and magnitude should not be hastily undertaken nor left to the action of committees already overburdened with other work. Your committee therefore suggests that a special committee be appointed, to be known as the Committee Upon the Revision of the Federal Mining Laws, whose duty it shall be to thoroughly examine the mining laws of the United States and other mining countries, and to formulate and present to the Association at its next annual meeting a complete code of Federal mining laws, to be presented to Congress for action by that body. Respectfully submitted, TIREY L. FORD, Chairman.

The Committee on Legislation is composed of the following members: Tirey L. Ford, John M. Wright, E. A. Belcher, A. H. Ricketts, James S. Farraher, Grant I. Taggart, Ross E. Browne, W. W. Kellog, C. F. Hoffman, R. McMurray, D. G. Reid, Frank R. Wehe, Hugh Craig, T. J. Parsons and Edward Coleman.

San Francisco, November 10, 1896.

A. H. Ricketts on Proposed Legislation.

The following remarks were made at the State Miners' Convention by A. H. Ricketts in reference to the proposed new laws and amendments affecting mining:

Mr. President: The proposed legislation which has been presented to this convention for appropriate action, by the MINING AND SCIENTIFIC PRESS of this city, comprises six bills and one proposed amendment to the State Constitution. These bills relate to the following subjects:

1. An act relating to the location, relocation, manner of recording lode and placer claims, mill sites, tunnel rights, amount of work necessary to hold possession of mining claims and the rights of co-owners thereon.

2. An act relating to removing, defacing or altering land marks, and amending Sec. 605, Penal Code.

3. An act relating to the robbery of mines and reduction works, and amending the act of 1850.

4. An act relating to the purchase of ores.

5. An act relating to liens of mechanics and others upon real property, and amending Sec. 1183, C. C. P.

6. A constitutional amendment defining what shall be construed as public uses, and amending Sec. 14 of Art. I of the Constitution.

7. An act relating to and defining placer claims, and amending Sec. 2329 of the U. S. Revised Statutes.

California has paid less legislative attention to the wants of the miner than any mining State or Territory, although the Federal mining law contemplates that its provisions shall be supplemented by State and Territorial legislation, as well as by the local rules of miners. In other words, the Federal mining law is a mere skeleton, the body of which it intends shall be supplied by the miners of each mining district by regulations not in conflict with the laws of the United States, or with the laws of the State or Territory in which the district is situated governing the location, manner of working, amount of work necessary to hold possession of a mining claim subject to these requirements, viz.: The location must be distinctly marked on the ground so that its boundaries can be readily traced; that all records of mining claims made after the tenth day of May, 1872, shall contain the name or names of the locators, the date of the location and such a description of the claim or claims located by reference to some natural object or permanent monument as will identify the claim.

All the mining States, except California and Nevada, and all the mining Territories have long since enacted general laws relating to the manner of locating and working mining claims. This not because of any doubt in the mind of the Legislature of the ability of the miners of each district to frame proper regulations governing this subject, but because of the confusion which necessarily arises from the fact that the laws of a district have no extra territorial effect, and there may be as many ways to locate a mining claim in a State as there are mining districts therein, unless regulated by a general law.

A general mining law of a State is always more accessible than district laws, is universal in its operation and operative until repealed, and so serves to give greater stability to the title of unpatented mining claims. For a local law must not only be established, but it must be *in force* at the time the location is made, and it is always a question of fact whether such regulation was or was not in force at any given time. If in force, the law is valid; if not, it is invalid.

In other words, says the Supreme Court of this

State, a local law does not, like a statute, acquire validity by its mere enactment, but from the customary acquiescence of the miners following its enactment.

The locator looks with tender regard upon his notice of location, both posted and recorded, and as one of the best evidences of his title; but in a very recent case the United States Supreme Court has held that no written instrument is necessary to create the location right, in the absence of State or district laws, and in another and almost as recent a case the same court held that where the rules and regulations of the district in which the location had been made had fallen into disuse and was not at the time of the location and for a long time prior thereto had not been in force and effect, there was no statutory enactment that notices should be recorded; and the Supreme Court of this State holds, and the weight of authority is to the effect, that recording a notice of location is not required by the Federal mining law, and, when not required by State or local laws, is unnecessary and useless if made. And the United States Circuit Court for this district has held that: "The custom to record, and the place of the record, to be binding, ought to be so well known, understood and recognized in the district that locators should have no reasonable ground for doubt what is required to make and preserve a valid location."

It is perhaps safe to say that fully one-half of all the recorded notices of location in this State would be held to be inadmissible as evidence of any fact under the rulings of the Courts, either because the local law has fallen into disuse or because the notices affect claims lying within no organized mining district.

A State law will correct this evil and make a recorded notice *prima facie* evidence of the facts therein contained. The Federal mining law provides that the location shall be so marked that its boundaries can be readily traced. But the character, size or position of such monuments is not prescribed. The Courts hold that, in the absence of local law, any marking on the ground by stakes, monuments, mounds and written notices, whereby the boundaries of the location can be readily traced, is sufficient, and the local requirements as to what is a sufficient marking differ in the various districts. For instance, in one district the marking of the center line may be sufficient and in another district center end and side line monuments and a monument at each corner of the claim may be necessary. In other words, two monuments with proper notices thereon may be all that is required in one district and in the adjoining district eight or nine monuments must be erected or placed to comply with the law.

Can the "nomadic prospector" familiarize himself with, and properly act upon, all these different laws in California when the Supreme Court holds that "the act of Congress authorizing the location of claims does not state any time within which the location must be completed? But it says the claim must be distinctly marked on the ground so that its boundaries can be readily traced"—which is one of the most essential requisites of a valid location. Much must depend upon the conformation of the ground sought to be located as to what will or what will not constitute a sufficient marking of the ground under the Federal law; and, in one sense at least, it is possible that no statutory enactment or local rule as to the number of monuments to be placed upon a location will more than fairly serve that purpose. Still, a substantial compliance with the statute concerning the marking of a claim may always be supplemented by further acts. If necessary, monuments may be built higher or be more numerous than the law requires, or lines may be brushed out from one post to another, and so on as the exigencies of the particular case may necessitate to fully comply with the Federal law.

The first bill, in numerical order, presented for your consideration provides for the posting, recording the location notice, the contents thereof, and the time within which those acts shall be performed, to-wit: ninety days from discovery; this gives the locator time in which to perfect his location. And there is no doubt the discoverer of a mineral vein should have a reasonable time after the discovery of his vein in which to complete his location embracing the same. Wherever there has been any legislation upon the subject the time given after the discovery in which to complete a mining location has exceeded twenty days. The discovery is to be evidenced by a ten-foot shaft, or its equivalent, sunk within said time. This last is a provision found in all the statutes similar to the one here proposed, and is contained in the laws of many of the districts, and is a proper requirement, as no valid location of a lode claim can be made until a "discovery" is made within the limits of the ground sought to be appropriated. This bill further provides how abandoned claims may be relocated, and how amended locations may be made. That a locator may have his claim surveyed by a duly authorized surveyor and the field notes thereof incorporated in his recorded notice, and the same shall be *prima facie* evidence of the facts therein stated. This provision enables the mine-owner to have his surface lines determined, obviates the danger of the shifting of monuments or the subsequent overlapping of his claim by adjoining mine-owners or junior locators. These are advantages only otherwise obtainable by an official survey of his claim in patent proceedings. That the value of a day's labor of eight hours in performing the annual assessment work shall be $3. That work may be done on any one or outside of contiguous claims worked under a general system if for the benefit of all the claims and if equal in value to that which would be required on all the claims if they were separate or independent. This last provision perhaps amplifies the Federal law (Sec. 2324) upon that subject, but it is sanctioned by the decisions of the United States Supreme Court and other courts of high dignity.

That an affidavit of annual expenditures may be filed with the County Recorder within sixty days after the performance of such work, and such affidavit shall be *prima facie* evidence of the performance of the labor or improvements or both made upon the claim. It is true that the act of 1891 touches upon this subject, but it is not the most lucid expression of legislative interest, and in some respects may be said to be *non sequitur*. The bill further provides for the "advertising out" of delinquent co-owners and the effect as evidence of the record of such proceedings. Also, that if payment is duly made after the proceedings have been instituted, how the cloud upon the title to the claim thus raised may be cleared by either voluntary or involuntary proceedings. The act of 1891 touches also upon this subject, but does not provide any means for removing the cloud upon the title as above indicated. The bill further provides the manner in which placer claims, mill sites and tunnel rights may be located, and, further, that all the provisions of the act shall be equally applicable to all classes of locations except where the requirements as to any one class is manifestly inapplicable to any other class.

The salient features of the bill have been briefly stated. The bill is made up from the laws of the different mining States and Territories; in places it also embodies the language of the courts and of the Land Department of the United States. The fact that the necessity for substantially similar laws has long since been recognized by legislative enactment in other mining communities is one of the strongest arguments that can be presented to you in its behalf.

The second bill, in numerical order, is a proposed amendment of Sec. 605 of the Penal Code, making it a misdemeanor to maliciously remove, deface or alter landmarks, particularly the location stakes or monuments of a mining claim.

The third bill is a proposed amendment of Sec. 1 of the act of 1850, amended in 1872, relating to the stealing of ores, gold dust, amalgam, quicksilver or concentrates.

Both of the two bills last mentioned amplify the existing laws upon the several subjects, broaden their scope and are intended to give additional protection to the mining industry in this State.

The same remarks are applicable to the fourth bill, which is entitled "An act relating to the purchase of ores," and is intended to repress an evil which exists to a greater or less extent in every mining camp. This bill provides a means for the identification of ores sold and the ascertainment of the name of the person who delivered the same or received the proceeds thereof. A similar statute prevails in Colorado.

The fifth bill is a proposed amendment of Sec. 1183 of the Code of Civil Procedure relating to liens of mechanics and others upon real property, and is intended to secure to the laboring miner a greater right than is afforded by the existing provisions of the law upon that subject. The most cursory reading of the present law will show its manifold deficiencies as to the miner's right of lien and the necessity for its enlargement. The Supreme Court's construction of this law has tended to emphasize its inherent defects, and the proposed amendment has been drawn in the light of its decisions.

The proposed amendment to Sec. 14 of Art. 1 of the Constitution defines what shall be construed as public uses, and is taken bodily from the act of 1895. In view of the publication in the MINING AND SCIENTIFIC PRESS of the 7th of the editorial headed "Eminent Domain in Mining," copies of which are before you, it would seem like a work of supererogation for me to say anything further as to the reason why this constitutional amendment appears to be a proper measure for your consideration.

The necessity for a congressional definition of what may be included in a placer location has been made evident by the recent ruling of the Commissioner of the General Land Office in the recent case of Aldritt vs. Northern Pacific R. R. Co., which has been so fully explained in an editorial in the MINING AND SCIENTIFIC PRESS in its issue of October 31st last.

A proposed amendment of Sec. 2329 of the United States Revised Statutes is submitted for your consideration. It simply defines as "placer" what the Land Department has held to be "placer" for about fifteen years before the Aldritt decision.

It is not assumed that these various matters are free from error, although great care has been taken in their preparation.

Since the publication of these bills, several very important amendments have been made thereto at the suggestion of the Alameda delegation, and it is hoped that this convention will likewise add to the efficiency of this proposed legislation. I now, on behalf of the mining industry of California, submit the matter for your consideration.

Laboratory Tests in Connection with the Extraction of Gold from Ores by the Cyanide Process.*

NUMBER II.

By H. VAN F. FURMAN, Denver, Colo.

Whether the ore requires roasting prior to leaching will depend principally upon the condition of the gold in it. If present as a telluride, the gold may be extracted from the raw ore by fine grinding and leaching with potassium cyanide; but the action of the solution on the tellurides is slow, and it may be more economical to subject the ore to a preliminary roast. Roasting presents two disadvantages: it materially increases the cost of treatment, and it is liable to result in the formation of salts detrimental to the subsequent leaching; for example, soluble sulphates, which decompose potassium cyanide. Unless the roasting is carefully conducted, gold may be lost by volatilization. This is especially the case with tellurides. On the other hand, many ores are rendered more porous by roasting, and thus the rate of percolation is increased and coarser particles can be leached.

The best strength of solution and the time of maceration and percolation are important points. The time required and the amount of cyanide consumed will depend largely upon the strength of the solution employed. For example, the time required with a 1 per cent solution will generally be much less than with a 0.25 per cent solution. On the other hand, for many ores the consumption of cyanide with a 1 per cent solution is so great that the process becomes commercially impracticable, while with dilute solutions the ore may possibly be treated with success. In this connection, mention may be made of the use of additional reagents, such as sodium peroxide, bromine, etc., which *are said* to facilitate the extraction in many cases. This is a mooted point, and the use of these reagents is objected to by some, as they have a tendency to increase largely the consumption of zinc, when zinc is the precipitant employed, and to foul the solution. According to the equation of Elsner,

$$4Au + 8KCN + O_2 + 2H_2O = 4KAu(CN)_2 + 4KOH,$$

oxygen, or an oxidizer, is essential to the solution of the gold. It would appear to the writer that the necessary oxygen can be obtained from the air at less cost, and quite as conveniently, as by the introduction of expensive reagents.

The amount of potassium cyanide required per ton of ore, including the amount which is destroyed during treatment, is a vital point. The character of the ore and its associated minerals will determine the consumption of cyanide.

The rate of percolation of the solution through the ore is a question of some importance. It would appear as if too much had been made of this point, as it is essential that the solution should remain in contact with the ore for a considerable time in order to insure a good extraction. On most ores the percolation will generally be quite as rapid as the necessary time of contact will permit.

A small quantity of the ore should be ground to 30-mesh, which is a suitable degree of fineness for the preliminary experiments. A sample is carefully cut out of this prepared pulp, ground to pass 100-mesh, and assayed for gold and silver in the usual manner.

A quantity of stock solution, containing 0.5 or 0.6 per cent of potassium cyanide, should be prepared. As this solution is liable to decomposition, it should be kept in a stoppered bottle, protected from the air and sunlight, and should be tested from time to time according to Test 6.

It is necessary that the water used in making up the stock solution should be quite pure. It should always be tested for impurities, for should it contain iron salts, magnesium sulphate, salts with an acid reaction, soluble sulphides, free carbonic acid, or sulphuric acid, they will decompose the potassium cyanide.

I.—DETERMINATION OF ACIDITY.

Should an ore be acid, the result will be decomposition of potassium cyanide unless this acidity is destroyed before the cyanide solution is added.

Soluble Acidity.—Agitate 10 grammes of the pulp for ten minutes with 50 c.c. of water; filter, and test the filtrate with litmus paper for acidity. Should acidity be shown, wash the ore until the washings no longer give an acid reaction when tested with litmus paper. Now titrate the total filtrate with deci-normal caustic soda solution, until the neutral point is obtained, using litmus as an indicator.

Latent Acidity.—Transfer the washed ore to a small porcelain evaporating dish; cover with water; add a measured excess of deci-normal caustic soda solution; stir and titrate the excess of soda with deci-normal acid solution. This gives the latent acidity.

*Transactions Am. Inst. M. E., September, 1896.

Scientific Progress.

Compressed Air for Street Cars.

The Manhattan Elevated Railroad of New York has authorized an air-power company to place one of its motors on one of its lines to run on schedule time and to draw a train of five cars. If it should be a success in this trial the Manhattan Company will consider the use of air motors on the entire system. The compressed-air locomotive or motor is little more than a long, black cylinder, similar to the boiler of the present locomotive, with the cab at one end. There will be no smokestack, no tender and no dome. The only protuberances on the cylinder besides the cab will be the whistle and the sand-box. The air power company claims that it can draw loaded trains more rapidly, smoothly and safely than is done by the steam locomotive, and at a decrease in operating expense, and points to its cars now running on the 125th Street branch of the Third Avenue cable line, in New York City, as an example of what it can do. The company avers that the public and the railway officials are more than satisfied with the cars, and that it is only a question of time when compressed air will supersede steam, cable, electric and horse power on city street railways.

THE observers at the Blue Hill observatory have sent definite details of their great kite ascension of October 8, when records were made with their meteorograph at a height of 9,385 feet above a level. More than three miles of piano wire were paid out, the ascension beginning at 9:15 A. M. and ending at 9:05 P. M. The pull on wire was from twenty to fifty pounds at the start, and ranged from fifty to ninety-pounds at the highest point, after which it slowly decreased. The instrument entered and passed through the clouds, as shown by the record of very dry air above the clouds. The temperature fell from 46° at the hill to 20° at an altitude of 8,750 feet. The meteorograph record in ink on a revolving cylinder run by clockwork was the best yet obtainable. The lifting force consisted of seven Eddy and two Hargrave kites from 6 to 9 feet in diameter, and the ascension was managed by Clayton, Fergusson, and Sewatland of the observatory. The instrument was more than a mile high during three hours. This breaks all kite altitude records. The height, 9,385 feet, is about 1,000 feet less than two miles.—Scientific American.

A NEW PROCESS for the manufacture of steel, invented by B. Stockman of Manchester, England, is claimed to be a success. The process involves a combination of both the Bessemer and the open-hearth methods of manufacture, and it is a basic dephosphorizing system. The molten phosphoric iron is brought into contact, in a converter or similar vessel, with dephosphorizing agents—nitrate of soda, common salt and titanic iron sand being the chief ingredients—and, after a contact of only three minutes, the metalloids are practically eliminated. The metal is then poured into an open-hearth melting furnace, where it is treated for about two hours, during which time the dephosphorization and desulphurization are completed, and the carbon is added in the usual way, as spiegeleisen or ferro-manganese. The steel produced by this system has been tested by Kirkaldy of London and Nash of Sheffield, and the results are said to be satisfactory. It appears to be adapted to the production of steel of any degree of hardness, and, as it only occupies about 2½ to 2½ hours, it is comparatively inexpensive.

IN a recent lecture on what sanitation has done for human life, Prof. Brewer of Yale University said that no one doubts that human life has been prolonged by the application of science in the last fifty years. How much, mathematically, this amounts to, in years, in per cents, is an unanswerable question. We can never have the data in figures. Even if we had our vital statistics completed for that period, men would differ as to the relative value of the several factors in this problem. Our great cities would not exist—they could not exist—without the aids of science. We have had an ancient Egyptian and Greek and Roman civilizations, which were pagan, and later Christian civilization, and all were powerless to convert practices. Between the epidemics that raged from time to time and the high death rate in the best of years, the population of Europe, as a whole, probably scarcely increased at all for 1000 or 1200 years. This century came in without a single city in Christendom with a million of inhabitants. Paris had in 1800 but 548,000; London and its suburbs in 1801, 864,845. The other great English cities had less than 100,000. Great cities could not endure then. First, the people could not be fed. Then, most of the population had to be fed and food produced within twenty miles of the place of consumption. Science has now made it possible to transport food half way around the globe, and has discovered new methods of preservation as well. City population was not self-perpetuating. Man died off; the death rate was continually high, and from time to time there was death by pestilence. Even where there were sewers, they were to drain the ground of water rather than to carry away sewage. Now cities are made nearly as healthy as the country.

Electrical Progress.

AT Montreux, in Switzerland, the electric tramway gets its power from a very small stream, and from the old Roman town of Vevey to the mediæval castle of Chillon one may ride in a trolley car propelled by the power of an insignificant little stream. The capabilities of this general utilization of natural power are beginning to be understood everywhere, and with the appreciation of the possibilities of the best methods of long-distance transmission, the development of many mountain streams must surely come. There are innumerable streams which, while very small, are yet very high, and these can, with comparatively little difficulty be impounded and carried down many hundreds of feet, thus making up for their lack of volume by the great pressure readily obtainable, and, either by the use of electricity or compressed air, the power may be transmitted to many points of application with but little loss.

IT is proposed by the electrician of the St. Louis and Suburban Railway to establish and maintain a bicycle corps, the duties of which will be to answer calls and patrol certain sections of the road. A few days ago one of the line workers used a wheel, and the result of the experiment proved satisfactory. Where minor troubles develop one working electrician is generally enough to remove the fault. Where there is trouble at any point along the line the "hurry-up wagon" and three or four men are dispatched. Often several calls are received at the same time from different localities, and all of them cannot be answered at once. With a bicycle corps this difficulty would, in a measure, be overcome. Defects in overhead work would also be discovered before they developed trouble.

THE new process for the direct production of iron and steel from the ore, which is being introduced in Sweden by Dr. De Laval, is said to consist in mixing pulverized iron ore with carbon, probably in the form of pulverized peat, and subjecting the same in some form of a rotating cylinder to heat, after which it is brought into direct contact with an electric arc of immense power, which reduces the ore to metallic iron, says *Industries and Iron*. The melted iron then flows into a large and highly heated furnace, where it can either be manufactured directly into steel or cast in any suitable form for further treatment. Dr. De Laval commenced his experiments something like three years ago at Trollhattan. It is said that Dr. De Laval has purchased one side of the entire water power at Trollhattan, which is made up of four falls, yielding an aggregate horse power of from 60,000 to 70,000. He has also purchased at considerable expense very much larger water powers in the north of Sweden.

Mechanical Progress.

The Efficiency of Hydraulic Dredging.

The efficiency of a hydraulic dredge, considered as a machine for raising mud and earth, is very low; but, taking the total result and comparing it with other methods of doing the same work, it presents a great advantage. The efficiency of a good centrifugal pump for water is from 55 to 65 per cent under ordinary conditions; that of a dredging pump is necessarily somewhat less, being from 48 to 55.

Let us take, for example, the work done in pumping a mixture of 15 per cent of sand and 85 per cent of water against a head of 40 feet. We will assume, for the sake of calculation, that the pump has an 18-inch discharge, and that the velocity of flow is 10 feet per second. Now, the weight of such a mixture of mud and water per cubic foot will be 85 per cent of that of a cubic foot of water at 62½ pounds, equals 53.12 pounds, plus 15 per cent of that of a cubic foot of sand at 120 pounds equals 18 pounds, or a total of 71 pounds per cubic foot.

The discharge of the pump will be 1056 cubic feet per minute, and the foot-pounds of work done will be that due to 1056 cubic feet at 71 pounds per cubic foot, raised to a height of 40 feet. This is equal to 2,999,040 foot-pounds per minute, or, say, 90 horse power. At 50 per cent efficiency, the horse power required to drive the pump will be 180. From this it can be deduced that an engine of 180 horse power, requiring, say, three and a half tons of coal per ten hours, will dredge and elevate about 350 cubic yards of solid material per hour, 40 feet high, or 1000 cubic yards per ton of coal.

Now, a good dipper or grapple dredge, burning three and a half tons of coal per day, will dredge on an average 2000 cubic yards per ten hours, or, say, 570 cubic yards per ton of coal. The dipper dredge, however, simply picks the material up and puts it down again—either into a scow or on the bank, if it is near enough to reach. The hydraulic dredge, on the other hand, will deliver its output to a considerable distance and spread it evenly over the surface. It is safe to say that transporting and spreading the material is at least worth as much as dredging it, so that, on this basic, the work of the hydraulic dredge has double the economic value of other types which do not transport and spread. These figures are, of course, merely approximate and will vary greatly, according to circumstances; but they will serve to illustrate the difference between the types.

In general terms it may be said that the hydraulic dredge is adapted to work under conditions where the material is homogeneous, that is to say, free from large obstructions, and where a fluid or semi-fluid discharge can be provided for. This discharge may be at any distance up to a mile or more. By homogeneous material is meant sand, clay, earth, gravel, alluvial deposit, and, in fact, everything that does not contain large obstructions, such as boulders, roots or stumps, etc., and any material which can be disintegrated by plow or cutter. All such material is capable of being carried through a pipe, when mixed with from 60 to 90 per cent of water, the amount that can be carried in suspension depending on the distance, velocity of flow and character of material. Stones and other objects of considerable size can be washed through the pipe; in fact, any solids can be carried that will pass through the openings in the pump.

The form of pump commonly employed is the centrifugal. For dredging purposes this is made extra heavy: the internal passages should be large and free, and with curves of large radius. The interior of the pump is sometimes fitted with lining plates to take the wear and abrasion. This wear, however, is not great, and a well-designed dreding pump is about as durable as any other kind of dredging machine.—A. W. Robinson, in Cassier's Magazine.

CHARLES S. CROWDEN of Beeston, England, has devised a new process for joining tubes, or, as he terms it, "welding tubes by hydraulic power." With two tubes to join, one is made to fit into the other. The inside of the outer one is spirally grooved along the length of the proposed join. Water power is brought to bear inside the inner one. The water endeavors to burst it, but it merely succeeds in pressing it into the grooves of the outer tube, which form a kind of mould to which the inner tube is shaped. The inner tube is not only shaped to the grooving of the outer by the water pressure, but it is fixed to it. On the removal of the pressure the two tubes are indissolubly united, and the object is attained. It is claimed that by this process a bicycle frame can be "welded" in five minutes or less.

IN a building in New York City, which is let out in sections, compressed air is added to the list of conveniences at the service of tenants. An air compressor is placed in the engine room of the building, and air power will be supplied to all the tenants of the building who desire it. The compressor is run by steam, and compresses the air into an air receiver. The building is piped throughout, pipes being run up through the shaft and branches taken off at the floors. The plant has been put down by a company having large interests in compressed air apparatus, and is intended to demonstrate the number of uses to which compressed air can be put in ordinary business and domestic life.

NEW JERSEY now has 29.72 miles of railway to every 100 square miles of territory. This is a larger percentage of track to area than is contained in any other State. Massachusetts comes next, with 26.35; Pennsylvania next, with 21.67; Ohio, 21.13; Connecticut, 20.81; Rhode Island, 20.37. In the proportion of railroad mileage to inhabitants Arizona leads, there being 208.51 miles of railway to every 10,000 of population in that territory.

Practical Information.

Of Interest to Inventors.

All inventions are classified in the United States Patent Office. The present classification, revised January 1, 1895, contains 213 classes, subdivided into 6322 sub-classes. Persons desiring to inform themselves in regard to the state of the art in any line of invention can best do so by purchasing printed copies of the specifications and drawings of patents in the sub-class containing the invention, the number and class of which will be given upon application to the Commissioner of Patents at Washington. Those wishing to subscribe for the printed copies of specifications and drawings of future patents in any sub-class may do so by depositing any amount from five dollars upward, the sum depending upon the size of the sub-class. The copies will then be mailed to them weekly at the rate of three cents each, until the deposit shall have become exhausted, when notice will be duly sent for renewal of deposit if desired. Orders for specifications and drawings by classes should give the numbers as well as the titles of the class and sub-class. Orders for single patents should give the number and date of the patent and the name of the inventor. Drawings of all patents from earliest to present

date have been photolithographed, with few exceptions. The cost of copies of drawings with specifications, if printed, is five cents per copy. If the specification has not been printed an additional cost of ten cents per one hundred words of manuscript copy will be charged. For the convenience of persons ordering copies of patents, or of the *Official Gazette*, coupon orders, good for one drawing and printed specification or one number of the *Gazette*, are sold in quantities of twenty or multiples thereof at five cents each. These may be used singly, and are good until used. The *Official Gazette* contains a copy of all patents issued, and is published weekly at five dollars per year. All subscriptions must begin with January or July numbers. There are no club rates, no discount to dealers, no free sample copies, and all subscriptions must be paid in advance. All correspondence relating to the above should be addressed to the Commissioner of Patents, Washington, D. C.

THE annual report of A. Blue, Director of Mines for Canada, shows that last year the total number of wells in the Petrolea district was 6787, and in the Oil Springs field 3176, making a total of 9963. There have been vigorous developments in various fields since this report was compiled. Wells have been put down in Plympton township, in Bothwell, and on Pelee Island, and many new wells have been put down in the original field, so that to-day there are considerably over 10,000 wells in this oil field. The contract price for drilling a well in the Petrolea field is about $110, the oil being usually reached at 460 to 465 feet. Forty sets of tools were running last year in the territory, much greater activity being shown since the price of crude went up. One rig, working in daytime only, will complete a well in less than two weeks, and the average number of wells drilled is about eighty per month. About 100 wells are abandoned every year, but this is owing to local obstructions and not to failure of oil, it being found cheaper to drill a new well than to clean out an old one.

THE French Department of Public Works have collected returns of the railway systems in Europe at the end of 1895, which are classified as to length of line by countries as follows: Germany occupies the first place with 29,032 miles; France comes second with 25,130 miles; Russia third with 22,225 miles, and Great Britain fourth with 21,025 miles. The other countries come in this order, namely: Austria-Hungary, 19,312; Italy, 9,410; Spain, 7,533; Sweden, 6,097; Belgium, 3,838, and Switzerland, 2,208 miles of track.

"HISTORY OF CRIPPLE CREEK."

We have just issued in book form the only authentic and reliable history of Cripple Creek gold camp, the marvel of the mining world. The book contains numerous full-page illustrations (with map) of gold mines true to life. With the sole object of introducing our big 8-page 56-column illustrated weekly paper (established 1890) we will send a copy of the above interesting book free to all who send us 25c (stamps or silver), for a 3 months' (13 weeks) trial subscription to our big weekly, which contains the latest mining news and illustrations of Rocky mountain scenery. Club of 5 and 5 books, $1. Mention THE PRESS and address, *Illustrated Weekly*, Denver, Colo.

THE OVERLAND LIMITED, VIA UNION PACIFIC.

Only 3 1-2 Days to Chicago-----3 1-2.
Only 4 1-2 Days to New York---4 1-2.

The Union Pacific is the only line running Pullman double Drawing-Room sleepers and Dining Cars San Francisco to Chicago daily without change. Only one change to New York; dining car service entire distance. Vestibuled composite buffet smoking and library cars between Ogden and Chicago.

The only line running upholstered Pullman Tourist sleepers San Francisco to Chicago daily without change, and personally conducted excursions to St. Paul and Chicago without change, leaving San Francisco every Friday.

Tickets and sleeping-car reservations at No. 1 Montgomery St. Steamship tickets on sale to and from all points in Europe. D. W. HITCHCOCK, General Agent, San Francisco.

GOLD MINE FOR SALE.

Covering Over 6000 Feet of the Mother Lode with Extensive Developments and Improvements.

Working Bond on Liberal Terms will be Given. Address O. H., Mining and Scientific Press Office.

IMPROVED MINERS' LANTERN.

A light, simple, cheap and efficient Lantern which will remain lighted in the strongest drafts. County or State rights for sale on royalty. MRS. HATTIE DELZELL, Jackson, Cal.

WILL NEGOTIATE with owners or their duly authorized agents only.

WILL INVESTIGATE only thoroughly bona-fide properties, either Mines, Prospects or Mineral Lands, whose owners are willing to make reasonable terms. When sending reports on properties also send terms on which you are willing to sell or lease.

E. N. BREITUNG,
Marquette, Mich., U. S. A.

Operator and Dealer in

Mines, Mining Properties and Mineral Lands,

Mining Stocks, Bonds, Options, Leases, Contracts and Securities.

MONEY LOANED ON BONA-FIDE MINES.

WILL EXAMINE on reasonable terms all kinds of Mines, Mining Properties and Mineral Lands as to their value, method of working and the condition of their titles.

WILL GIVE Options, Leases, Bonds and Contracts on all kinds of Mines, Mining Properties and Mineral Lands.

Assay and Chemical Work Done on Reasonable Terms.

Have best of bank and other references. Use McNeill's or A B C Telegraphic Codes.

DO ALL OUR OWN EXPERT AND CHEMICAL WORK.

CALIFORNIA STUMP PULLER.

This is a photograph of the Stump Puller at work on redwood stumps on the farm of C. E. Ogburn, Guerneville, California.

In the improved form in which it is now offered to the public, it is universally admitted to be the most practical, powerful and successful machine of the kind in America, and the only machine in existence that can be successfully operated on hill land.

Coast Industrial Notes.

—The telephone company is arranging to extend their lines and give direct communication between this city and San Diego.

—The Tulare Soda Factory and Bottling Works were destroyed by fire last Tuesday. The insurance was $1450 and the loss about $5000.

—A party of engineers has left Stockton to make preliminary surveys for a route for the Sierra Pacific Railway from that city to Sonora and other points in the mines.

—The San Francisco & Pacific Glass Works in this city, which has been idle for a long time, started up this week with 100 men employed. The force will soon be increased to 250.

—Word has been received from the East that the projectors of the Sacramento and Orangevale Railroad have determined to commence work immediately. It will be run by electricity and will tap the American river fruit district. The cost will be about $400,000.

—General Miles in his annual report to the Secretary of War recommends the following expenditures for high power guns, mortars and other artillery: at San Diego, $600,925; San Francisco, $902,850; mouth of the Columbia river, Oregon, $566,325; Puget Sound $764,050.

—The San Francisco Bridge Company's dredger Oakland has commenced work in Olympia harbor and will widen the channel so far as an expenditure of $32,000 will permit. The plans of improvement provide for a channel about 1000 feet from the north street bridge to deep water.

—The Northern Pacific Steamship Company announces that it has chartered the steamer Macduff to ply between Tacoma and Yokohama. This vessel was chartered to relieve the increased traffic from America to the Orient. The Macduff is a tramp steamer of 1882 tons registered, and is now at Hongkong.

—Work has been begun on the railway into Alum Rock Park from San Jose. The road will be extended about three-fourths of a mile and end near the bath houses, where a neat station will be erected. The work will cost about $10,000. In order to get into the park it will be necessary to construct a tunnel 338 feet in length.

—An organization has been incorporated under the name of the California Stone Brick Company, which proposes to expend $50,000 in the purchase of a site and the erection of buildings for the manufacture of bricks from sand. Plans for the kiln have been drawn and a search is now being made for a proper site in the neighborhood of San Francisco.

—A meeting will be held this evening in Sausalito to form a permanent organization whose objects will be the securing of a boulevard from San Rafael to Sausalito, the erection of milestones, the destruction of obnoxious weeds and the planting of trees and greensward on the sides of the county roads, besides other improvements for southern Marin.

—The committee of the California exhibitors of the Central American Exposition at Guatemala has organized, with Charles Bundschu chairman, E. R. Lilienthal treasurer and Carl H. Clark secretary pro tem., adding Mr. Pereira as official representative of the Guatemalan Exhibition committee. Mr. Clark has been instructed to draw up the necessary contract and interview the various merchants and manufacturers who had already signified their intention of exhibiting at the Guatemalan Exposition, as well as others who might be interested likewise.

Recent California Mining Incorporations.

Archimedes Gold Dredging Company, Marysville; A. C. Irwin, J. R. Garrett, S. O. Gunning, Marysville; R. H. and H. W. Postlethwaite, Saratoga; W. D. Goshard, San Jose; capital stock, $1,000,000; $80,000 subscribed.

Stine Mine and Milling Company, Los Angeles; F. Lindenfeld, J. A. Lovie, H. P. Von Der Lohe, J. D. Stine, N. T. Blair, Los Angeles; capital stock, $2,000,000; $77,500 subscribed.

Quartz Glenn Mining Company, San Francisco; George West, Frank A. West, W. T. Harris, John W. Ferris and Arthur W. Bell.

Triumph Mining Company, San Francisco; August Mackintosh, Kenneth Mackintosh and George H. Stipp.

The San Andreas Mining Company, San Francisco; John D. French, William Forsyth, Horace G. Platt, Benjamin H. Ramsdell and Mortimer Fleischbacker.

Personal.

GOVERNOR BUDD has appointed Miles Wallace of Madera commissioner of Yosemite Valley, vice George W. Sperry, resigned.

IVAN H. PARKER, the successful business manager of the Colfax, Cal., *Sentinel*, has bought the entire establishment and will continue to do good work for the miners of Placer county.

MR. GEO. F. KUTZ, who has been chief engineer at the United States Navy Yard at Mare Island for a generation and who recently retired after a long and honorable record, has taken the position of superintendent of marine engineering in the establishment of Chas. C. Moore & Co., 32 First street, San Francisco.

CHARLES F. HOFFMANN, who has been for many years manager of the Red Point drift mines in Placer county, owned by French capitalists, has accepted a three years' engagement in Siberia and will leave shortly accompanied by his son Ross Hoffmann. Mr. Hoffmann was prominently mentioned for the presidency of the California Miners' Association, until Mr. Neff consented to again accept the office.

EX-UNITED STATES SENATOR STEPHEN W. DORSEY has returned from London, where he went to interest capitalists in his plan to develop the mines at Picacho, and was successful. For several years the ex-senator's home has been in Denver, and for a year and a half past he has been interested in a large group of gold mines near the Colorado river, twenty-eight miles from Yuma, in southern California.

Recently Declared Mining Dividends.

Star King, Utah, Nov. 9, $37,500, payable Nov. 16, a total to date of $825,000, of which $375,000 has been paid this year.

Swansea, Utah, $5000, payable Nov. 10.

Mercur, Utah, $25,000, payable Nov. 20.

Galena, Utah, $5000, payable Nov. 20.

Utah, Utah, $2000, payable Nov. 16.

Commercial Paragraphs.

THE tunnel of the Pioneer mine, Placer county, Cal., is being driven ten feet daily. The power to run the drills is furnished by a Rix duplex 13x16-inch water-jacketed air compressor, built by the Fulton Engineering Works of San Francisco, and the working pressure at the drills is from 90 to 100 pounds.

THE Colorado Iron Works Company of Denver, Col., has issued a second edition of their pamphlet on "Ore Crushing Machinery," that will be of value to those interested in mills and smelters.

THE Prospective Mining and Machinery Co., 127 First street, San Francisco, recently shipped a Tremain steam stamp to C. C. Mathews, Tehachapi, Cal., for the Uncle Sam mine, and one to H. W. Russell, Mojave, for the South Park district, Inyo county.

THE CALIFORNIA DEBRIS COMMISSION, having received application to mine by the hyraulic process from William Konradi, in the Blackwater claim, near Spanish Ranch, Plumas Co., to deposit tailings behind the Quincy Mining & Water Company's impounding works in Spanish Creek; from Walter Shackleford, in the Grub Flat Mine, No. 2, near Meadow Valley, Plumas Co., to deposit tailings in Reservoir Ravine; from Pitro Picolo and Luigi Sulbrero, in the Cleveland Placer Mine, near Johnsville, Plumas Co., to deposit tailings in a ravine below the mine; from Francis Jackson in the Sebastapol Flat Claim, near Spanish Ranch, Plumas Co., to deposit tailings in an old pit; from La Mont Brown, in the Preacher's Ravine Placer Mine, near Scales, Sierra Co., to deposit tailings in Preacher's Ravine; from F. B. Clark, in the Clark and Willis Mine, near Railroad Flat, Calaveras Co., to deposit tailings in a ravine below the mine; from Charles Edner, in the Lady Edner Mine, near Omo Ranch, El Dorado Co., to deposit tailings in a ravine below the mine; from Em Santirfo, in the Santa Clara Mine, near Volcano, Amador Co., to deposit tailings in South Branch of Sutter Creek; and from Eckart & Solario, in the Campi Placer Mine, near Volcano, Amador Co., to deposit tailings in a ravine below the mine, gives notice that a meeting will be held at room 59, Flood Building, San Francisco, Cal., on November 16, 1896, at 1:30 P.M.

GOLD MINING PROPERTIES.

Having thoroughly canvassed this section of country during the past seven months, I am enabled to furnish valuable information to capitalists desirous of bonding or purchasing meritorious mining properties in El Dorado county. Prospects, partially or wholly developed properties, or purchasable interests ready for operation but lacking capital, can be had on favorable terms. Address, A. E. HAMILTON, P. O. Box 66, Placerville, Cal.

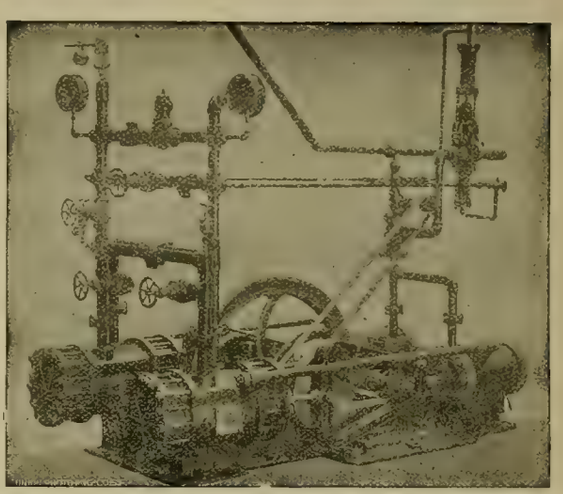
DOUBLE PIPE AIR COMPRESSOR.



This is a cut of the Double Pipe AirCompressor, the Compressor that is guaranteed to save 30% in power over any other make. It is cheapest to buy, cheapest to carry about and cheapest to run. If your fuel or water costs you anything, you want this Compressor. If you can get railroad freights free, and can carry machinery to your mine without cost, and your power costs you nothing, any make of Compressor will do you. You will be under no necessity to write to PNEUMATIC POWER CO., at 306 Pine St., San Francisco, Cal. We could save you money, though, in cost of foundations, as our Compressors are half the size of other makes.

A Standard Work.

THIRD EDITION JUST OUT.

Assaying Gold

.....AND.....

Silver Ores.

By C. H. AARON.

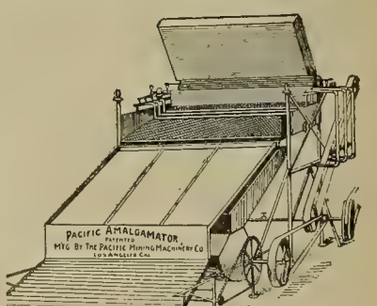
This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:—Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 126 12-mo pages, with illustrations, well bound in cloth; 1896. Price **$1.00** postpaid. Sold by the **Mining and Scientific Press**, 220 Market St., San Francisco.

THE PACIFIC AMALGAMATOR



Pacific Amalgamator

MANUFACTURED BY

Pacific Mining Machinery Co.

J. A. HEDGE

Inventor and Manager

MILL or PLACER.

A Guarantee with Each Machine.

This machine is the finest gold saver for both placer mines and quartz mills. No other plate necessary in mills where the Pacific Amalgamator is used. It is constructed almost entirely of metal; it can be transported on pack train. Possesses a large amount of silvered amalgamating plate surface. No scouring of amalgam. Any ordinary amalgamator can operate the machine with good success. Send for catalogue.

THE PACIFIC MINING MACHINERY CO.,

127 First Street,

San Francisco, Cal.

Mining Summary.

CALIFORNIA.

Amador.

Record: The new pump has been started up at the Potazuba mine, and the water is being lowered in the old shaft at a rapid rate.

At the Allen mine J. B. White has begun the work of erecting the new 40-stamp mill. 160,000 feet of lumber and 2000 tons of machinery are already contracted for.

Ledger: Sinking was resumed in the Amador Queen mine on the 1st.

The mill at the Gwin is completed and will be running in full force by the 1st of December. Sinking is still progressing.

James Greenwood has taken out several tons of very valuable ore from the Clearwater which he expects to have treated at Selby's.

The Kennedy Mining Company is having a new hoist built over the north shaft.

The people in and around Campo Seco are jubilant over the prospect of the Venus becoming a successful mining enterprise.

The Plymouth Rock is being worked on half time. It is rumored that it has been sold to a large syndicate which intends to erect a smelting plant on the ground. It is claimed that the copper in the ore will pay expenses of mining and working.

Republican: The Wieland mine has started sinking again, having received the necessary hose in connection with the big pump. They intend also to keep on drifting east and west at the 400-foot level. Ten stamps are run day and night. Thirty stamps will be started as soon as they meet the gouge ledge at the 400-foot level.

Butte.

Mercury: Fifty men are at work in the Magalia mine. The Princess mine is being worked by eight men. The Indian Spring mine also employs eight men.

The English syndicate is putting in a large quantity of 16-inch iron pipe and is cleaning out and repairing ditches, so as to bring in a large quantity of water. This company is operating two mines—one on Mosquito creek, under the supervision of S. P. Moody, and the other on Butte creek, under the supervision of E. C. Paxton.

The Best mine, which has been idle for a number of years, is now being opened and will be operated again in a short time.

Mercury: The mill and reduction works of Ekman & Spangler are nearly ready for work. They expect to commence crushing ore from the Gillett, Rhiel & Co. mine of Palermo.

Calaveras.

Chronicle: The Lightner mine, adjoining the Utica on the west, is now in the hands of a company of large means, and work has been commenced thereon. It is the intention of the owners to put the main shaft down 1000 feet.

Work at the South Paloma mine has been suspended for a few days pending bids for sinking shaft.

J. Sargent has a small force of men at work grading for a mill site in the Gwin mine where it is his intention to erect a small mill and work the ore from his mine.

At the Petticoat mine active operations are going on. There is a substantial hoist on the mine, 40 feet high. The shaft, which is a double compartment one, 6x14, is now open to water level. A new building 24x36 has just been erected, which is to be used for an engine room. The machinery is now on the road.

At the Mitchell mine the tunnel is now in 450 feet. A 75-foot winze in face of drift shows 5 feet of galena ore that prospects well. An incline shaft is now being sunk at the mouth of the tunnel. There is a 70-horse power engine on the ground. The new mill will be started about the 1st of December.

Citizen: The California Exploration Company has begun operations on several of their properties in this vicinity. The company is doing prospecting and development work principally, employing three or four men in each mine. The corps of surveyors who are running off the electric line reached San Andreas last week, and the poles to be used are at Valley Springs.

It is reported at Murphys that negotiations are pending for the bonding of several mines owned by Antone Ponte of San Domingo, the Boulder Lead upon which a rich strike was made last year being one of them.

Fresno.

Investor: The decision of the United States Land Office, in which the term "mineral lands" is held to apply only to lands containing metalliferous ores, has already caused trouble in this State, in the Coalinga region, in the southwestern part of Fresno county. These petroleum lands have been developed into oil fields of some value, and the original locators who have spent money and developed their land as mineral claims, are now having trouble with a number of men who have come in and jumped the lands, filing homesteads on them on the ground that the legal decision referred to makes such lands open for homestead settlement. As is well known, the petroleum lands of California are sterile and broken, unfit for agriculture or for grazing. This is especially true of the Fresno county oil fields, where even in the spring season grass cannot be made to grow. There is no water near the petroleum fields, and, as the Fresno *Expositor* says, it is folly for any one to assent that he would seek such a forbidding region for a home. The homesteaders refuse to move, and as the original locators are determined to resist the usurpation of their land, trouble is feared.

Inyo.

There are more men now at work in the mines at Silver Peak than for several months past. There is reason to expect the work there to go on under its present management.

Mariposa.

Gazette: At the Horseshoe mine in Hunter's valley the owners have added another battery of five stamps to their mill. This will enable them to crush all the rock of the vein. Heretofore they crushed only the low-grade ore.

Nevada.

Transcript: The output of bullion at the Champion mine last month is said to be the largest ever produced by any quartz mine in this district in one month. Some very rich ore has recently been encountered and the mine is looking better than ever. Both mills are kept running night and day. The company has paid up all of the indebtedness, and the prospects are bright for big dividends to the stockholders in the near future. Next spring work will be rushed ahead on the North Merrifield and on the Spanish, both of which mines are now owned by the Champion company. Operations will be conducted on an extensive scale and it is believed that when everything is under way the company will have more men employed than at any other mine in the State, with one exception—the Utica mine at Angels Camp.

Union: A number of miners have leased the Gold Gravel mine on the Rodda ranch, about two miles from town, and will proceed to develop the claim at once. The company will put new hoisting and pumping machinery on the ground.

Union: The Plumbago mine at Moore's Flat is looking well and indications are that it will be paying dividends soon. There are three tunnels on the mine, one over 1000 feet, one 900 feet and the third 210 feet.

The quartz mill at the Old Home Consolidated mine, near the Mt. Vernon House, has started crushing. There is considerable ore on the dump and it is expected that enough will be taken out to keep the mill running steadily.

Placer.

(Special Correspondence).—The new tunnel the Pioneer Gold Mining Co. are now running to cut the present working vein at a depth of 510 feet below the present level, is being driven ahead at a very quick rate. For the thirty-one days ending October 31, 1896, this tunnel was advanced 306 feet, or nearly 10 feet every twenty-four hours, and for the week ending November 7th the tunnel has been advanced 78 feet. This is very fast work. The formation is in hard slate rock, with occasional bodies of very hard quartzite cutting through it. The size of the tunnel is 6½ feet wide, 7 feet high, and with a grade of 6 inches to 100 feet. The tunnel is being run with two 3½-inch drill machines. The holes are drilled to a depth of from 9½ to 10½ feet at each drilling, and it takes twelve holes in the face of the tunnel to break the face. The tunnel is now in 1500 feet and will have to run 1300 feet yet before the back vein is reached.

Sentinel: The Rising Sun mine, near Colfax, has produced hundreds of thousands of dollars in gold and has worked through a shaft to a depth of 900 feet. The cost of running pumps and hoisting machinery in operating the mine through the shaft was very great, so a bedrock tunnel has been completed for a distance of 200 feet. This tunnel will tap the mine at the 500-foot level. The mouth of the tunnel is near Bear river, and it will require 1800 feet of tunnel to tap the shaft at the old works.

Plumas.

Independent: The Harrison mine in Granite basin has closed down for the season, after a most successful season's work.

San Diego.

Ex-United States Senator Stephen W. Dorsey has returned from London where he went to obtain money for developing his mines in the Picacho district. Speaking of this he says: "The mill which I will erect will be at Picacho, twenty-eight miles north of Yuma. We have a 15-stamp mill there now, but the new one will be a 100-stamp and will treat an enormous amount of ore. We have some large ledges. The ore runs from $5 to $6 a ton, it being about twice as rich as that of the Alaska Treadwell mine.

"I will also build a railroad five and a half miles long to carry the ore from the mine to the mill, which will be located on the bank of the Colorado river."

Ramona *Sentinel*: There are some capitalists expected at Julian soon to look at the Helvetia property.

Some rich rock has been struck on the Lucky Ben claim owned by Bacon and Cook.

In the Rush district, Rush & Co., have drifted 70 feet on their Tellurium claim and have run through a 3-foot ledge of pay rock and are now drifting for the main chute of ore.

Shasta.

Free Press: The comparatively new mining camp of Harrison gulch still continues to show remarkable growth. The operations of Colonel J. H. Roberts of Sacramento in improving the mining property, which he recently purchased of Rhodes, Fowler & Benton, and in completing the mill are being retarded for the want of building material. Estimates made show that the Colonel will have expended $150,000 ere he is ready to begin crushing ore. The mining locations owned by Ferdinand Hurst are being developed and are showing up well. He recently shipped a carload of thirty tons of ore from one of his claims to the Selby Smelting and Lead Company, which netted him $182 per ton.

Siskiyou.

Journal: The miners in the Salmon river section, are preparing for their winter's work. They will begin piping just as soon as fall rains furnish them sufficient water.

At Oro Fino the Wright & Fletcher mine and the Eastlick brother's claims will not start up much before spring, as it requires a large head of water to run the mines. The Gardiner mine will be started up soon.

The owners of the Garret mine at Hamburg have leased it to a Chinese company for $3,000 for the remainder of the season.

The quartz mill at Mugginsville is about completed, and will soon commence crushing ore from A. Erno's mine.

The Chamberlain & Timmons mill, on Mill creek, is kept in operation constantly, and the owners expect a good return from the large amount of ore which they have on the dump.

The Columbia mine, adjoining the Mabel mine, near Scott Bar, is producing good quartz, which is crushed at the Columbia mill, on Mill creek.

Journal: The indications for a prosperous season next spring and summer in our mines are excellent. A number of new companies have made purchases in the county, and will have their new properties in full operation by that time. The big hydraulic plants on Thompson creek and Horse creek will greatly increase Siskiyou's gold product. Several new mills have also been built in the county, and will be in operation. Inquiries are constantly being made regarding mining properties by outsiders.

The pipe for the new company which recently purchased the Shinar mine, on Thompson creek, has been hauled to the mine, and the new ditch will soon be completed. The water will be carried across the Klamath river in pipes suspended by a cable.

The Seattle Placer Mining Company will soon commence operations on Thompson creek and will employ quite a force of men. It was purchased about two years ago for $10,000, and the new owners have made a great many improvements since.

The Klamath river dredger is still at work at Buckeye Bar, and the reports are that the owners are well satisfied with the results.

The Blue Gravel mine at Greenhorn will be started up as soon as there is sufficient water. This property has given employment to a number of men for several winters past.

Tuolumne.

Independent: In the past two weeks a large lot of heavy machinery, consisting of engines, boiler, and 14-inch pipe has passed through Sonora to the Confidence mine.

The Green and Tibbitts mine has rapidly improved in the last few weeks as development work has been done on it, and has lately produced ore of high grade in free gold.

NEVADA.

The Cortez silver mine will begin operations at once and 200 men will be put to work. This mine was a steady producer and is the property of Simon Wenban of this city.

Enterprise: A circular letter signed by President Forrester has been recently addressed to the shareholders of the Carson River Placer Mining Company, calling on them to subscribe 10 cents a share. Should the call fail to meet with a favorable response reorganization will be resorted to under a new title, which will render the present issue of stock worthless. The erection of a leaching plant of 100 tons daily, to cost $10,000 or more, is stated as the object of the subscription. The leaching process is to be adopted for working the low-grade sulphurets recovered from the bed of the river.

The company has been in existence for about twelve years under various titles, and has expended $120,000 in experimenting with costly dredging machinery.

The buried treasure on the river bottom has been vastly overestimated, some placing it as high as $30,000,000, but $10,000,000 would be a nearer guess. This treasure is not in the form of solid amalgam, but is mingled with the virgin material of the river, but in the form of slimes, sulphurets and floured or pulverized quicksilver. To arrive at a proper estimate of the amount of this material that has escaped in the form of tailings from the mill settlers, it must be taken into consideration that these tailings, after leaving the settlers, flowed over tables or blanket sluices swept three or four times in each twenty-four hours, and a large percentage of the coarser and valuable material contained therein was concentrated and saved by this process. It is probable that the only way to recover the buried treasure is to drain the river bed by diverting its flow through a flume of a capacity to carry its volume throughout the year. It is estimated that this would require a flume with a width of 40 feet on the bottom, with sides 4 feet in height, and would cost $60,000 a mile for the lumber. Whether the expense of recovering this buried treasure would warrant such an outlay is extremely problematical, as there is no method known whereby a fair average of the value of the material recovered can be obtained, on account of its constant shifting from point to point through the action of the water.

OREGON.

The miners who have been operating in Rogue river by means of wingdams have done well this season.

Operations have been resumed at the Jewett mine, near Grant's Pass.

The Consolidated Saxe Creek Mining Co. will resume work on their properties in a short time.

The date for the holding of the annual meeting of the Southern Oregon Miners' Association has been postponed to Nov. 16 at Grant's Pass.

Monitor Miner: E. O. Lampher and Chas. H. Lawrence, mining experts from Chicago, representing capital, have been in the country for the past ten days examining into mining resources.

Jacksonville *Democratic Times*: A run of ten tons of ore from the Goldbug mine, owned by Farnham, Billings & Lucas of Ashland, last week yielded $19 per ton in free gold, besides the concentrates.

C. L. Mangum has sold the Cameron ditches and water rights on Star gulch, in Applegate mining district, to O. G. Shurtliff, E. Sikes and others of Portland.

Grant's Pass will soon have a custom quartz mill and cyanide plant, to be erected by Dr. W. H. Flanagan.

WASHINGTON.

Spokane *Chronicle*: Word comes in of a rich strike in the Bald Knob mine at Methow Camp, in the Squaw creek district, near the Friday mine.

The Friday Company is making preparations to begin work on a smelter which is to be completed this year. Machinery for the new plant on Goat creek, twenty-five miles away, was hauled in two weeks ago and is now being put in place.

Large crowds of workingmen and prospectors are being attracted to the country by the recent strikes, and it is believed the coming winter will be one of great activity. The Red Shirt and Friday Companies are making preparations to employ larger numbers of miners than ever before.

BRITISH COLUMBIA.

(Special Correspondence).—Victoria, as the capital of the province of British Columbia, naturally focuses the news of the gold fields. A reasonable mining project meets with consideration and respect. In the island of Vancouver itself, outside of the coal measures there is but little actual mining going on. There are some excellent prospects that later may develop into mines. At Alberni the Consolidated Company is doing considerable work. This coporation owns four claims, the Victoria, Warspite, Chicago and Alberni. The shaft is down about 70 feet on the ledge, and there is a tunnel making connection with it at a distance of about 85 feet. The pay streak is rich. Recently a 3-stamp mill has been erected for sampling purposes and there is every indication to show that this Alberni country will shortly make a name for itself in the ranks of the gold-producing districts. It is well situated for economical working. Wood and water are plentiful. The ledges run N.E. and S.W. and appear to dip at an angle of about 70 degrees.

Gold mining is not a new thing in Vancouver Island. Over 40 years ago California miners came here and prospected around finding numerous indications of gold. The conditions at that time, however, prevented profitable work. To-day the old prospect holes are being reopened and with the economy that is now possible it appears likely that this district will develop into a permanent gold field.

As the capital of the province Victoria is the principal market for stocks and shares in mining companies, and a very considerable business in that way is transacted. In the new fields on the mainland there are dozens of companies whose stocks are dealt in by the people of Victoria. Most of these concerns are eminently respectable and are starting work with every prospect of success. There are, however, some, as is always the case in a time of gold mining excitement, whose object is to dig into the pockets of the credulous instead of into the bowels of the earth.

The British Columbia Board of Trade has just issued its 17th annual report. It is an extremely interesting document and is very credible to its compiler, Mr. F. Elworthy, the secretary of the Board of Trade. Anyone proposing to visit British Columbia would be wise to write for a copy of this report. It is distributed gratuitously.

On the subject of mining the report says:

"The value of the output of minerals, other than coal, increased from $1,241,031, in 1894, to approximately $5,000,000 in the year 1895, as follows:

"Trail creek district, 22,972 tons, yielding 45,950 ounces gold, 2,572,850 pounds copper.

"Slocan district, 9307 tons shipping ore, 30,000 tons concentrates, yielding 1,837,100 ounces silver, 17,145,000 pounds lead.

"Ainsworth district, 43,644 tons yielding 605,550 ounces silver, 28,906,800 pounds lead.

"Nelson district, 3707 tons, yielding 176,560 ounces silver, 494,370 pounds copper.

"West Kootenay, placer gold, $10,520.

"Cariboo, Cassiar, Yale, Lillooet and East Kootenay, placers, $491,025.

"Fairview and Camp McKinney, quartz, $135,000."

Victoria, Nov. 8th, '96. R. W. W.

Spokesman Review: The largest deal which has ever been made in the Slocan country was consummated on Friday last, when the two-thirds interest in the Ruth Mining Company, owned by D. C. Clark, J. P. O'Neill, F. E. Starkey and G. Y. Kessler, passed into the hands of H. M. Forster, a member of the English Parliament, for $166,666.66, practically cash.

Nelson *Tribune*: The prospects along the North Fork of Salmon have received considerable attention during the past two weeks and a number of transfers, involving nine claims in all, have been made.

During the past ten months at the North Star mine 6,000 tons of ore has been mined. Of this, 2,500 tons has been shipped to market. This output of 6,000 tons was taken from the drifts and crosscuts while developing the property, leaving about 40,000 tons in sight in the mine. The ore is sent to smelters in the United States.

The report of the shipments of bullion, matte and ore from the mines of Southern Kootenay for the last week in October shows that the total was 784½ tons, valued at $86,684. The total for 1896, so far, was 25,139⅛ tons, valued at $2,771,272.

Documents have been signed conveying the controlling interest in the Alpine group on head of Lemon Creek to a foreign syndicate for $60,000.

Ore will be shipped from the Bondholder, Neepawa, Oregon City and Enterprise so soon as snow flies, the latter putting out five tons a day at least.

The people on the coast are warming up on the subject of a railway from Southern Kootenay to the coast, in order to secure a portion of trade of the district. In view of the imperative necessity of a railway from the coast to Kootenay country, it is desirable that the provincial government build, equip

and control the said railway, pledging the credit of the province to that end, and that the coast cities be made common points, and that this board of trade ask the other provincial boards of trade to each appoint two delegates to meet and confer with the provincial governments on this subject without delay.

Trail Creek *News*: In the Cariboo country, at Quesnelle Forks, work on the Golden River Quesnelle Company's dam will be pushed, with 200 men employed all winter, and in the early spring it is safe to say 500 men will be employed. The Cariboo mine, in conjunction with its Moorehead lake ditch, and James Moore property that is to be opened up; the Montreal Company with their ten miles of ditch; the Fishback, Maud, Beavermouth, Harvey Creek, and other big properties; the big drifting and hydraulic mines of the Horse Fly, only thirty miles away Quesnelle Forks and vicinity will furnish employment to several thousand men. At Slough Creek, Willow River, Antler, Cunningham, Big Valley and other creeks and at Barkerville, where mines are being opened up to work by the Cariboo Gold Fields Company with a hydraulic elevator, considerable work is being done.

ALASKA.

A report from Tacoma says that J P. Ladd of that city, who represents a New York syndicate, will return to Alaska next season for the purpose of establishing a hydraulic plant on Resurrection creek. The Al-Ki brought news of the sale of the Horrible and Mexican lode claims in the Berners bay district by Frank Bach to L. Nicholai of Portland. The price was $60,000, of which one-fourth was paid in cash. The mines have two well-defined ledges, with over 400 feet of tunnels. The ore assays $8 to $10 per ton in free gold.

The Al-Ki brought down 240 California and Washington miners from Cook Inlet, who were left at Sitka over three weeks ago by the steamer Excelsior. About 175 men will winter in Sunrise city and Hope city.

IDAHO.

A telegram to the Denver *News* says: "The Helena and Frisco has been sold to the Standard Oil Company, who already own the Bunker Hill and the Sullivan. The announcement of the sale comes from unofficial sources, but there is no doubt that it has been made, although the transfer may not be made for some time to come. The Helena and Frisco is nearly all owned in Helena, and is one of the largest mines in the Coeur d'Alenes, employing 125 men and mills 525 tons of ore daily. Nothing is known regarding the price, but as it has paid $500,000 in dividends during the past year, the consideration must be a heavy one."

UTAH.

Among the companies most prominently interested in the annulment of the patent under which the MacArthur-Forrest people claimed the right to collect a royalty was the Mercur. It was made to answer directly in the action in which the claimants of the patent set up. The contest was taken up in South Africa, and there it was decided that the patent was invalid. Subsequently the Court of Appeals of England permitted the owners of the process to amend the exhibit on which they had procured their patent, and a few months later the Mercur people made a compromise with the patentees for $20,000. Meanwhile the Sunshine had adopted the process, and when a representative of the patentees called on the company to pay tribute, a suit similar to that in which the Mercur was engaged was threatened, then the Sunshine agreed to pay $119,000 for the use of the process.

At present the cyanide process is being used at the Spanish mill ot Bingham; at the Mercur, Marion, Geyser, Sacramento and Sunshine, in Camp Floyd mining district; at the De La Mar mine in Idaho, and very extensively at Cripple Creek.

Salt Lake *Tribune*: The Pleasant Valley Coal Company shipped from its Winter Quarters mine, near Scofield, about 12,000 tons of coal in October. They employ at their two mines there 150 miners and 75 other men, making a payroll of about 225 men. Miners are paid 60 cents per ton for mining coal, and their average earnings during the days operated are from $3 to $3.25 per day. Under the new law they are not permitted to work over eight hours in any one day, while an agreement among the miners limits them to six mine carloads each per day, the cars holding 1 to 1¼ tons of coal each. The mines are now being operated six days per week. During the summer it was from two to four days per week only, as the demands required. Besides its local market, the Pleasant Valley Coal Company is marketing much coal outside. Pleasant Valley coal is quoted daily in San Francisco market reports, where it is gaining popularity as a fuel for all purposes.

The Union Pacific mine at Pleasant valley turned out about 4500 tons of coal in October, and there are now employed about seventy men around the mine. This vein of 24 feet lies practically level.

The Wasatch Asphaltum Company has twenty-two men getting out asphaltum rock at its mines near Clear Creek station on the Rio Grande Western Railway. Shipments of this paving material have been going forward to Chicago pretty regularly for months for use in paving streets in several cities on or near Lake Michigan.

Park *Record*: The Silver King has a large body of free-milling ore, and the company has for some time been considering the feasibility of building a mill to work that class of ore, and may do so yet provided the market for silver takes a turn for the better.

Bingham *Bulletin*: Shipments in October were smaller than any other month this year, amounting in all to only 2000 tons. October is said to have been the first month in over fifteen years that not a pound of ore was shipped from the Old Jordan and South Galena mines. Local causes figured in the entire suspension, as all work done for some time has been in the line of development and putting the mines in repair; but, of course, the main drawback is the markets.

Since work was recently started at the Badger mine the vein has rapidly improved and is now showing 18 inches of rich sand carbonates and galena. The incline has reached a depth of 500 feet.

A deal has been closed by which a majority of the shareholders of the Golden Gate Mining Company of Mercur place their stock in escrow under an agreement giving J. B. Black control. The intention is to continue the exploration in depth.

MONTANA.

Butte *Inter-Mountain*: The financial troubles of the Golden Scepter Mining Company have culminated in the assignment of the company to Colburn & Brown of Philadelphia for the benefit of Eastern creditors, who hold claims amounting to $285,000. Colburn is the president of the Golden Scepter Company. Although the plant and mine are estimated to be worth at least half a million dollars, the stockholders were tardy about putting up money. Just what effect the present proceedings will have on the operation of the properties this year is not known.

Mining World: The Cumberland dump, said to contain about 10,000 tons of ore, will be hauled to Leadboro.

The operators of the Daisy mine at Cooke City, have cut through a 30-foot body of good milling ore. The operations have been removed to the other side of the hill to avoid the heavy snow fall.

Garver and Bunnel of Clancy have sold the G. & B. mine, located on the middle fork of Warm Springs creek, to Tommy Cruse and W. J. Sweeney of Helena. The price said to be paid for the property was $50,000.

The Gold Dredging Company operating near Bannack has closed down all work for the season. This season's operations have proved the ground to be more valuable than was originally claimed.

Work on the Clark's Fork gold dredging machine has been suspended. C. H. Dietrich, president of the company, says that the undertaking so far has not proved a success, the chief fault being that the sluice boxes are too small for the size of the steam dredge, thus preventing the successful washing of the gravel raised from the bed of the stream. It is proposed to have larger sluice boxes constructed of steel and mount them on pontoons.

The Overwich country is beginning to show up and attract outside attention. The Black Jumbo and Little Pete claims, owned by Joe Burgoyne and others were recently bonded to a Chicago syndicate for $30,000.

WYOMING.

The Carbon County and Gold Coin Mining Company has contracted for the erection of a stamp mill in the Cooper Hill mining district near Laramie.

A wonderful discovery of gold ore is reported in the Grand Encampment mining district, in the southern part of Carbon county. A prospector made the find. The lead is 40 feet wide and projects out of the ground for several hundred yards.

SOUTH DAKOTA

Black Hills *Times*: The St. Elmo M. & M. Co. have opened up a new and large vein of rich ore on their property situated near Hill city.

The Big Owl M. Co. will resume work in a few days on their group of four claims, situated on the southeast slope of Elk mountain.

COLORADO.

Republican: The Cripple Creek district is producing more ore than ever, the output ranging between 500 and 600 tons a day. It begins to look as if the camp may exceed the estimated production of $10,000,000 for 1896.

Twenty-eight sets of lessees are now working on various blocks of the Pike's Peak placer, located in the northwestern suburb of Cripple Creek. The Lewis leasing shaft is producing some ore of good grade from a first-class vein three feet in width, and the indications are strong for a mine.

In October the Union Gold Company produced 600 tons of $50 ore, making the month's yeld in round numbers $30.000. Owing to the fact that the Union properties have reached that stage which requires more permanent improvements, dividends are not being paid.

The Morning Star mine's new plant at Ward has been successfully started and thirty men are employed under ground in development work and knocking down ore. The company recently purchased the mine for $65,000, and has spent $20,000 in improvements in and upon the property. Another $20,000 is yet to be spent in additional equipment.

In the San Juan mining region at Eureka Gulch there are three mills with a capacity of 325 tons a day; at Telluride, including the Tomboy and Smuggler-Union, five mills with a combined daily capacity of 750 tons, and at Ouray one mill, the Revenue tunnel, with a capaciey of 300 tons.

In the Pitkin district a newly organized company is doing extensive development on the Red Jacket group of six claims, located on West mountain, about a half mile below Pitkin.

The Cleopatra mine is employing a large force of men and is producing a high grade product of silver-lead ore.

J. C. Gifford, a member of the Chicago Board of Trade, has purchased the Golden Inlet mine and put a force of men to work. The Golden Inlet is considered by mining men to be one of the best properties in the gold belt.

The Argentum-Juniata Company of Aspen has issued its report for July 1st to October 1st, which shows that the aggregate shipments was 1,361 tons of ore, which returned 105,971 ounces of silver, valued at $68,212.12; smelting and railroad charges amounted to $12,166.68; mine operating expense and sampling at Aspen used up $35,483.53, leaving as a net profit at the mine for the three months of $20,566 91, the average gross value of the ore being $50 a ton.

At Saw Pit a new strike has been made in the breast of the Nancy Hanks tunnel, which is now in 410 feet.

The Belle Champion tunnel is in 430 feet, running 100 feet below the contact. An incline upraise is being driven to reach the contact, where it is said that 100 cars of ore are already blocked out.

At Central City the Calhoun shaft is now down 750 feet and Manager Bliebel intends to sink at least another lift on the 100 feet. Drifting and stoping work is also being prosecuted and shipments of mill ore are being made sufficient to keep two batteries of stamps dropping at the mills on ore, which gives returns of from two to three ounces in gold.

Word comes from Idaho Springs that the people working the Cecil mine in the Cascade have reached the ore chute for which they have been drifting for a year. It is proving all that was expected, and it is the intention to make the first shipments from the present workings.

A company has been organized to erect a portable smelter near Camp Carter for testing ores of the adjacent territory.

The new ten-inch water pipes recently purchased by the Elkton Company have been put in place and connections with the big pump made at the 300-foot station. The new pumps will be placed at the 400-foot level, where a big station 40x16 will be cut for them. The flow of water into the mine is about 500 gallons per minute.

ARIZONA.

(Special Correspondence).—The Black Copper group, the property of the Black Warrior Copper Company, capital $1,000,000, is in Globe mining district, seven miles west of Globe. John Whyte represents the interests of the Eastern syndicate. He and Supt. W. W. Hill are preparing for the reduction plant, which will include a blast furnace with a capacity of 120 tons per twenty-four hours. It is also probable that the company will erect a large leaching plant. This company also owns the Selby mine, four miles west of the Black Copper group. The ores of the Selby are chalcocite and carbonate and carry a large amount of iron. The company is now driving a cross-cut tunnel, which, when completed, will be 200 feet in length and will reach the ledge at a depth of 100 feet. The ores from this mine will serve as fluxings for the chrysocolla ores of the Black Copper group. A hoisting plant is to be built and the sinking of the Black Copper shaft resumed and run to a depth of several hundred feet. Matters in Globe have assumed a promising aspect. All lines of business are gaining in activity, and especially so since this company has shown its intentions, known to be undoubted, of becoming a large copper producer, and will add greatly to the already active Globe mining district.

The Continental group, which is situated eleven miles west of Globe and four miles west of the Black Copper group, lies between carbonaceous limestone and granite. Toward the southeast end of the Continental mine the granite gives place to diorite. The limestone runs along the full length of the Continental group, and as far as the Selby mine, while the granite runs along only part of the Continental group to the point where the diorite takes its place. The Continental has a large cropping of gossan mixed with chalcocite and copper carbonates. The cropping is over 50 feet in width and is tilted up like an immense cliff, over 60 feet high, from the mouth of the tunnel. Work will commence on the Continental Dec. 15th. It is anticipated that, when work is commenced upon this group and properly developed, it will number among the largest and most profitable producers of copper, gold and silver in the Territory of Arizona. Not only do the ores of the Continental carry a paying amount of gold and silver, but also a sufficient amount of iron and lime, which is a valuable item in the matter of fluxing, and thus the ores of the Continental are self-fluxing and will not necessitate the adding of foreign sterile fluxing materials.

The commencing of work on the Black Copper group, and the movements in the same direction upon the Continental, together with the operations of the two old companies—the Old Dominion Copper Mining and Smelting Company and the United Globe Mining Company, which two latter companies have been operating here for a number of years—all bespeak a great future for the town of Globe.

The property of the Girard Mining Company is situated in Lost gulch, six miles southwest of Globe. This company will put its 10-stamp mill in operation about the 10th inst.

Globe, Arizona, Nov. 1st.

SOUTH AFRICA.

South African *Mining Journal*: The report of the directors of the Rand Central Ore Reduction Company showed a very satisfactory state of affairs. A dividend of 10 per cent was declared, absorbing the sum of £14,875, and £5875 is carried forward to the new account. The company experienced difficulty during the year in making contracts for the treatment of sands, owing to the reluctance of mining companies to dispose of their stocks and in consequence of all companies treating their own productions at works erected by themselves. At the chlorination works a total of 2069 tons was treated and 10,153.52 ounces of fine gold was recovered. Plants are now at work at the Worcester, the May Consolidated, the Crœsus, the Robinson, the Crown Reef and the Bonanza companies, with an estimated total monthly tonnage of 25,000 for sands and 13,000 for slimes. Plants to treat 81,000 tons of sands and 34,000 tons of slimes are in course of construction, including the Van Ryn Estate, the Van Ryn West, Knights, Ginsberg, Glenluce, Lancaster, York and Balmoral companies.

Delegates to the Miners' Convention.

The following is a list of the delegates to the Convention as reported by the Committee on Credentials:

Alameda.—J. S. White, W. R. Thomas, T. W. Jeffries, A. H. Ricketts, S. H. Christy, E. H. Benjamin, George Burdick, W. E. Hale, G. I. Taggart, H. G. Blaisdel, Du Ray Smith, F. Chappellet, Mark Webber, W. C. Ralston, E. C. Regney, E. C. Loftus, Warren Shelling, Robert McKillican, John B. Eldridge, L. W. Foesting, R. R. Grayson, C. W. Childs, O. W. Jasper, W. G. Hawkett, John Driver, B. H. Mason, Daniel Best, Lyman Bridges.

Amador.—M. J. McDonald, C. E. Purington, E. E. Roberts, John R. Treglown, W. F. Keeney, John B. Treglown, E. C. Voorhies, Morris Brinn, John Ross, W. E. Dawns, S. M. Knight, J. H. Tibbetts, William Castle, W. J. McGee, John Treglown, Jackson Dennis, C. W. Randall, W. R. Thomas, W. E. Detert, John F. Davis, David Guiman, J. E. Dye, A. Cammetti, John M. Wright, L. F. Reichling, Col. H. D. Ramlett, Mr. Bibo, E. A. Freeman, John A. McIntyre, James T. Parks, Mr. Sargeant, Robert Robertson, Dr. Thomas Boyson, W. T. Jones, Thomas W. Jeffers, A. L. McWayne, J. H. Barney, James T. Wheeler, C. L. Haskins, P. Clute, A. Cassinelli, Frank Frades, J. W. Surface.

Butte.—Mr Sprague, W. E. Duncan, Sr., A. F. Jones, Frank McLaughlin.

Calaveras.—Ira Hill Reed, Richard Parker, T. T. Lane, Mr. Burleson, L. F. Sheperd, Sam E. Redmond, J. J. McSorley, E. C. Loftus, W. H. Clary, A. J. Brooks, Mark B. Kerr, Thomas E. McSorley, Edward Casey, W. Hooper, George Taylor, C. D. Lane, Alvinza Hayward.

El Dorado.—John Mellon, J. J. Crawford, N. E. Ricket, A. H. Ten Broeck, Thomas Clark, D. W. Morgan, A. Blane, O. S. Boekboe, James Richards, G. W. Harvey, D. H. Jackson, A. A. Wood, W. E. Chapman, W. H. Husband, Fred Husband, J. M. Brown, G. H. Burnham, J. F. Lang, C. N. Weatherwax, W. S. Mery, E. Bend, Max Mierson, M. Varozza, W. C. Root, J. H. Bradley, L. D. Greater.

Los Angeles.—F. W. Edelsten.

Nevada.—J. S. McBride, R. C. Walrath, Fred Zeitler, W. F. Englebright, M. Bates, E. J. Rector, J. S. Gregory, H. Lane, Geo. Nihell, W. Gibble, F. Eilerman, Geo. C. Gaylord, M. L. Marsh, Will Fisher, Geo. E. Turner, W. G. Richards, S. D. Matson, J. M. Walling, J. J. Jackson, C. J. Braud, Chas. Stepp, C. H. Mallon, J. A. Northway, Niles Searles, W. Martin, Dani Nirens, C. Schuster, D. McFall, J. T. Morgan, Joseph Fetz, Gus Kartgchoke, Fred Searles, Geo. C. Shaw, F. E. Wadsworth, N. P. Brown, Dr. E. F. Lebrech, A. H. Walrath, Mat Isoard, H. Pengelley, P. Tautphaus, Fr. Breckman, Jas Herster, C. Jepson, L. L. Myers, R. D. Sliedmore, J. H. Helwig, W. Mobley, Henry German, P. Curerow, Daniel Collin, C. E. Uren, F. J. Dawson, Thos. Pierce, Alf. Tregidgo, H. G. Parsons, W. F. Presk, C. E. Clench, Arthur Foote, Joseph Weissbein, Samuel Granger, J. L. Lakeman, John Glassow, L. E. Phillips, M. Farrell, E. C. Culver, John Eddie, T. H. Wilhelm, Geo. D. McLean, Louis Dorsey, Geo. Mainhart, D. B. Marsick, R. R. Porter, J. P. Maleville, Wm. Campbell, Edw. Morgan, Geo. Fletcher, Jas. Haskings, M. Sproul, J. F. Kidder, M. G. Taylor, W. R. Erckart, James Bennallock Sr., Wm. George, R. Linder, J. S. Goodwin, L. J. Graver, C. D. Einstein, H. Fuller, G. Ozalli, C. Peach, O. Waehler, E. J. De Sabla, C. L. Miller, R. H. Thomas, Robert Walker.

Placer.—Richard Thomas, John Landers, P. C. Secor, Wm. Rea Sr., R. M. Clarken, Col. Davis, B. J. Watson, Dr. B. B. Brower, J. F. McCall, J. P. Burchards, S. S. Vail, F. J. Horswell, F. G. Durning, Chas. D. Aikers, L. S. Moffith, S. M. Sprague, H. Simons, M. R. Gleeson, D. A. Russell, John Papa, Frank Papa, T. Michaels, Benj. Rossi, G. W. Cross, F. I. Adge, Seymour Waterhouse, C. G. Kershner, G. R. Cowan, Harold T. Power, St. C. Nye, Geo. Cooper, John W. Clark, John H. Ferguson, F. E. Colburn, T. J. Nichols, M. F. Lawrence, F. H. Bell, John Adams, J. M. Fulweiler, Chas. F. Reed, James L. Gould, J. E. Doolittle, John Nichols, Louis Petzlaff, Chris Ranckel, Morris Lobner, Henry Desque, Ivan B. Parker, W. A. Edenger, Henry Lobner, Allen Towle, Andrew Rodger, Joseph Dixon, Wm. Rodger, Wm. Rule, D. M. Kent, M. Morgans, F. Chappellet, Thomas Crosby, G. S. Sanborn, Chas. E. Mason, Chas. F. Hoffman, W. W. Ramsdell, Robert Jones, John C. Boggs, Chas A. Reed, Pillar Lozano, G. C. Hepburn, A. E. Moody, Edward Politka.

Plumas.—A. B. White, S. W. Cheney, G. P. Cornell, J. H. Roberts.

San Diego.—L. L. Aubury,...

San Francisco.—S. K. Thornton, Samuel J. Hendy, Niles Searles, L. F. Reichling, Louis Sloss, C. W. Cross, Julian Sonntag, Andrew Carrigan, A. J. Ralston, T. R. Church, Edw. Belcher, Louis Glass, Chas. G. Yale, Sam'l W. Backus, T. J. Parson, Louis Janin, W. D. Leonard, J. M. Wright, Geo. Stone, W. F. C. Hasson, F. H. Huntington, J. F. Halloran, W. W. Montague, Geo. Goodman, Geo. C. Sargent, B. D. Pike, Henry Pichoir, Geo. Johnston, Geo. W. Tomb, Alfred Holman, Calvert Meade, Jacob Frawenfeld, B. T. Lacy, James W. Abbott, J. C. Campbell, Ross E. Browne, Edward Coleman, Wm McDonald, John C. Coleman, Thos. Barber, Wakefield Baker, Squire Mooney, Charles Altenburg, F. W. G. Maebus, Doorman, Thomas Lally, Geo. A. Ames, Hugh Craig, J. C. Newson, D. E. Hayes, D. E. Miles, Thos. Kirkpatrick, Chas. Watt, A. McLaughlin, S. H. Tacy, John Bermingham Capt. W. F. Mills.

Santa Barbara.—J. B. Treadwell.

Santa Clara.—Chas. C. Derby, Robt. R. Bulmore, Edw. W. Carson, Richard Pearce, Thomas Wasley.

Siskiyou.—A. H. Bar. Maj. A. G. Myers, Martin C. Beem.

Sierra.—J. M. Harper, Chas. P. Gale, Julian Sonntag, Andrew Carrigan, Thos. Kirkpatrick, P. Carberry, Paul Meroux, H. W. Orear, J. W. Orear, H. H. Squire, John Scott, S. Purdy, Frank R. Wehe, Edw. F. Wehe, Tirey L. Ford, Lewis F. Byington, Wm. H. Byington, Louis Rosenfeld, Mason W. Mather, J. O. Jones, E. A. Miley, F. W. Page, Jas. McGregor, F. H. Campbell, W. F. Hanly, A. B. Moulder, Claude T. Hamilton, P. Van Cleif, I. Copeland, A. J. Meroux, Stanley H. Smith, J. A. Vaugh, J. F. Cowdery, Dan P. Cole, M. H. Mead, Henry Kingdon, A. Westall, H. Spalding, Sr., W. F. Eschbacher, John Costa, W. J. Holmes, Thos. H. Crossman, Jas. S. Wiggins, P. R. Gardner, J. M. Haven, I. T. Mooney, Geo. D. Gray, Giles H. Gray, Thos. C. Haven, J. H. Hickox, W. W. George, G. W. Hughes, C. C. McIvor, Henry Rosenfeld.

Shasta.—H. A. Keller, J. C. Hopper.

Tuolumne.—E. C. Loftus, D. R. Oliver, W. J. Sharwood.

Yuba.—J. O'Brien, Thomas Conlin, E. F. Holbrook, John McQuaid, W. W. Chamberlain, Louis Comath, C. C. Durnam, Joseph Durfee, O. C. Mayo, W. R. Meek, J. C. Campbell, James Nelson, Daniel Settens, Wm. Jeffards, Wm. C. Hall, G. McM. Ross.

Kern.—B. F. Price.

Madera.—J. W. Ragesdale.

Alpine.—O. Nelson.

Colorado.—Edward J. Field.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING NOVEMBER 3, 1896.

570,785.—NECK YOKE—J. S. Brown, Eureka, Cal.
570,537.—CLOTH CUTTER—J. Brusie, Oakland, Cal.
570,841.—OPERATING WINDOWS—M. M. Canfield, Seattle, Wash.
570,661.—STEP LADDER—W B. Cantrell, Seattle, Wash.
570,623.—SHIFTING APPARATUS—A. Chavanne, Grass Valley, Cal.
570,843.—ORE SEPARATOR—H. M. Copland, Scottsburg, Or.
570,738.—CAR AND RETORT—Curtis & Isaacs, S. F.
570,789.—NUT LOCK—E. Fluehr, Sprague, Wash.
570,727.—VALVE—H. B. Gale, S. F.
570,628.—LETTER BOX—F. G. Gaschlin, S F.
570,550.—LIFTING JACK—W. L. Hall, Spokane, Wash.
570,705.—POWDER—F. A. Halsey, San Rafael, Cal.
570,753.—HAY LOADER—J. T. Hare, Fresno, Cal.
570,799.—BARREL BUNG—J. Henn, S F.
570,756.—STEAM TURBINE—R. Hewson, S. F.
570,665.—SASH FASTENER—C. Hoffman, Spokane, Wash.
570,636.—IRONING TABLE—C. L. Hofwolt, Santa Rosa, Cal.
570,637.—CHAIN LINK—B. Holt, Stockton, Cal.
570,807.—STOCKING—J. H. Jessen, S F.
570,639.—POLISHING MACHINE—Jessup & Wheelan, S. F.
570,483.—AIR BRAKE—C. W. June, Ellensburg, Wash.
570,640.—COOKING PAPER STOCK—M. D. Keeney, Antioch, Cal.
570,641.—COOKING PAPER STOCK—M. D. Keeney, Antioch, Cal.
570,643.—ROTARY PUMP—J. D. Keller, Santa Clara, Cal.
570,601.—RAILWAY SPIKE—E. E. Knight, S. F.
570,670.—SASH LOCK—D. O. Livermore, Los Gatos, Cal.
570,763.—FRUIT BOX—E. R. Morrill, Truckee, Cal.
570,649.—GAS ENGINE—R. J. Rolfson, S. F.
570,584.—ROTARY ENGINE—C. G. White, Woodland, Cal.
570,526.—WATER ELEVATOR—M. H. White, Wanatchee, Wash.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

LINKS FOR DRIVING CHAINS.—Benjamin Holt, Stockton, Cal. No. 570,637. Dated Nov. 3, 1896. This invention relates to an improvement in the links composing driving chains. It is especially adapted to that class of chains in which the links are cast in malleable metal narrower at one end than the other, so that the narrower end of one link fits between the wider end of the opposite one, and they are united by a pin passing through the two. The improvement consists of a link of this description, having a sleeve or barrel cast with and extending between the narrower end a pin or bolt, the ends of which are fixed in openings in the wider end of the link, said sleeve or barrel being a complete cylinder, having its pin-hole offset upon the side against which pressure and wear are brought, the offset extending from end to end of the barrel, and a segmental wear plate removably fitted to the offset, so that it may be replaced whenever worn out without destroying the remainder of the link.

STEAM TURBINE.—Robert Hewson, San Francisco, Cal. No. 570,756. Dated Nov. 3, 1896. This invention relates to an apparatus or motor in which steam or other elastic medium under pressure is employed. It consists of a peculiarly constructed wheel with a series of buckets concentric with the axis or shaft, into which buckets the propelling medium is admitted under pressure to act expansively and with reactionary force, and is conducted successively from one series of buckets through stationary concentric chambers upon each side of the wheel to the next interior buckets and is finally exhausted from the last chamber surrounding the shaft.

CLOTH OR TWINE CUTTER.—James Brusie, Oakland, Cal. No. 570,537. Dated Nov. 3, 1896. This invention relates to a cutting device, which is applicable to the hand of the operator and is especially useful for cutting cloth where goods are to be cut into lengths, and also the string with which packages are done up. It consists essentially of a flexible band to be fitted upon the hand, a disk fitted upon the band having a groove or channel transversely across its outer face, a central hole made through it with a countersunk depression on the inner side concentric with the hole, a bar fitting the exterior groove or channel with a shank extending through the hole, having a head fitting the depression beneath and a spring holding the bar in place, said spring yielding so that the bar may be drawn up and reversed and the cutting blade fixed to the exterior surface of the bar.

ROTARY ENGINE.—Charles G. White, Woodland, Cal., assignor of one-half interest to J. F. Hink, same place. No. 570,584. Dated Nov. 3, 1896. This invention relates to an apparatus which may be used either as an engine or a pump and is designed to provide certain improvements in that class of rotary machines in which radial pistons are movable in planes parallel with the shaft and are alternately projected into the upper portion of the cylinder and withdrawn therefrom. It consists essentially of a cylinder case, a drum or cylinder fitting one end of the same with a central shaft, radial grooves or channels formed in the cylinder having rectangular blades or pistons slidable in them, a hub extending from the cylinder to the end of the open space in the casing having corresponding grooves in which the inner edges of the pistons are guided, a cam-shaped channel formed in the interior periphery of the case, lugs projecting from the outer edges of the pistons to engage with the channel, so that the rotation of the cylinder alternately projects and retracts the piston, and a segmental abutment extending across one side of the open chamber of the case from the interior periphery to the hub, and inlet and outlet openings adjacent thereto.

WANTED,

A First-Class Mill Superintendent.

A good position, with opportunity for advancement, for a young man who understands all the duties necessary for taking charge of a 40-stamp gold mill. Must understand assaying and electro-silve plating. Inquire by letter only, stating experience, to D. A. JENNINGS, ESQ., 401 California St., San Francisco.

WANTED,

A position as Superintendent or Assistant Superintendent in copper-silver or silver-lead smelting works.

Understands mining, sampling, assaying, furnace management, handling men.

Prefer Mexico or Spanish South America. Speaks Spanish. Best references.

Address METALLURGIST this office

British Columbia.

W. J. R. COWELL, B.A., F.G.S., Mining Engineer,

Reports on mines, designs and superintends the erection of mining and milling machinery; makes analyses of ores, metals, soils, etc.; arranges for mill tests, and selects suitable processes for the treatment of ores. Correspondence invited. Address W. J. R. COWELL, Victoria, B. C.

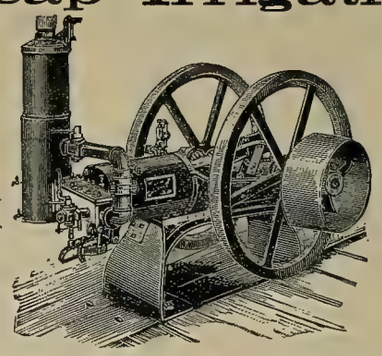
Cheap Irrigation!

SAVE MONEY BY USING



The "Daniel Best" Crude Oil Engine.

This Engine can be operated on either Crude Oil, Distillate, Gasoline, or Kerosene. **It is the cheapest power on earth** and is not tied to any one kind of Oil, but can use any kind that will make gas and is not handicapped by being compelled to use a certain Oil. Do not forget this when in need of an Engine.

Notwithstanding what some other makers claim, we guarantee our Engines to work perfectly on California Crude Oil or Distillate, or any other kind of gaseous Oil; we however prefer CALIFORNIA CRUDE OIL, notwithstanding what some other makers of Gas Engines say to the contrary, for the reason that gas from Crude Oil will produce more power from the number of feet of gas used than from any other Oil, and it is also a natural lubricant as well, the valves being always lubricated sufficiently to prevent them from sticking, thus assuring greater durability of the working parts than it otherwise would be in using dry gas, as is the case with other makes of Gas Engines which are compelled to use dry gas produced from one kind of oil. And another advantage we claim is, that danger from explosions is reduced to a minimum, there being no accumulation of gas, but is used by the Engine as fast as it is generated and hence is absolutely safe. The following is a test that we made with one of our Five-Horse Power Crude Oil Engines, running ten hours on the different gas oils:

California Crude Oil, 40 gravity,	7½	gallons at 7	cts.,	.52½
Distillate	40	"	7½	"	8	"	.60
Domestic Coal Oil	40	"	7½	"	12½	"	.93⅜
Gasoline	74	"	8⅛	"	15	"	1.21¼
City Gas	1000	feet,					2.00

We will guarantee the above results, and we are prepared to convince any one that our Crude Oil or Distillate Engines can be operated for less money than any other so-called "Distillate" Engine made.

There is an abundance of first-class Crude Oil produced in this State and of the very best quality, and recent discoveries have demonstrated the fact that it contains very little, if any, asphaltum and the Oil is of a rich green color which denotes a paraffine base, notwithstanding what other Gas Engine makers might say to the contrary, whose Engines cannot be operated on Crude Oil. This Crude Oil can be and is purchased at the oil wells at 3 cents per gallon in any desired quantity. We will guarantee that one and a half gallons of this Crude Oil will produce one-horse power running steadily for ten hours (when used in our Engine) and that the residue will not exceed three-fourths of a gallon in ten gallons, and this residue is not a loss but is a fair lubricant and can be used as such on any part of our Engine. We have sold a large number of Engines and a greater part of them are running on Crude Oil, and our customers cannot say enough in their praise.

We manufacture all sizes from two-horse power up, and will guarantee that our Engines will run cheaper and are more simple in construction, have fewer parts and hence are more durable than any other Gas Engines on the market. Seeing is believing; don't take our word for it, but come and investigate for yourselves. You can always see one in operation at our works. We will be pleased to see you and will at all times take pleasure in showing them up. Our Engines are specially adapted for running well and mining machinery—in fact, for any kind of power desired. We are the pioneers and first inventors of Crude Oil and Distillate Engines. **We always lead and never follow.** Send for Catalogue and Price List of the only genuine Crude Oil and Distillate Engine made.

PATENTEE { Brown's Complete Automatic Mill Process. Brown's System of Mechanically Stirred Roasting, Cooling and Conveying Furnaces, Etc.
1607-8 Manhattan Building, Chicago, Illinois.

KENDALL GOLD AND SILVER EXTRACTION CO.

THE KENDALL PROCESS is the most efficient method of using cyanide for the extraction of precious metals from their ores. Wherever this process has been adopted the result has been increased percentages of values recovered and saving of time. Material reduction in consumption of chemical has also been demonstrated with respect to several classes of ores.

All ores, without exception, amenable to cyanide treatment can be treated to better advantage by the Kendall Process. This can be accepted as an axiom.

The Kendall system of gold and silver milling comprises (1) the Extraction Process, in which the chemical solution extracts the values from ores; (2) the Recovery Process, by which the gold and silver are obtained from the solution, and (3) a modified form of plant, not indispensable, but permitting the use of unskilled labor.

Owners of mines and reduction works can obtain full information on application to
KENDALL GOLD AND SILVER EXTRACTION CO.....47 Broadway, New York City.

The General Gold Extracting Co., Ltd.,

PELATAN-CLERICI PROCESS.
Patented in U. S. and Other Countries. Capital, £100,000.
London Head Office.....8 Drapers Gardens.
Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.

This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.

Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.

F. CLERICI, Manager for U. S.

Improved Self-Contained Cushion-Frame Five-Stamp Mill.
Patented in the United States and Foreign Countries.

The Improved, Iron-Frame, Self-Contained, Cushion-Frame, Five-Stamp Mill Saves Bills for Heavy Timbers, Millwright and Mechanics' Labor, and a Large Amount of Space. The term "Self-Contained" Means a Great Deal to the Mine Owner, and Can Be Readily Recognized and Appreciated in Making an Estimate For an Ordinary Five-Stamp Plant, When the Comparative Cost is Considered Over a Wood-Frame Mill.

FIRST: There is Saved by the Use of This Mill a Large Bill for Heavy Timbers, in Many Instances Obtained at Great Expense and Loss Of Time.

SECOND: The Saving in Mill-Wright and Mechanics' Labor in Framing and Erecting.

THIRD: The Large Amount of Space Saved.

Late improvements in the amalgamation and concentration of ores enable us to offer to the mining public in connection with our Self-Contained Mills, an apparatus which amalgamates and concentrates at the same operation and provides a perfect trap for escaping quicksilver. Write to us for information.

Send for Catalogue and Price List.

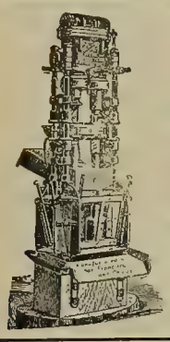
Consulting Engineers for
SACRAMENTO ELECTRIC POWER AND LIGHT CO.
NEVADA COUNTY ELECTRIC POWER CO.
LOS ANGELES RAILWAY CO.
310 PINE STREET, SAN FRANCISCO. BRADBURY BLOCK, LOS ANGELES.



Tremain Steam Ore Stamp.

COMPLETE FREE-MILLING PLANT FOR $1,000.
Consisting of One TREMAIN STEAM STAMP, with Automatic Feed, capacity from 8 to 12 Tons a Day; One Upright Boiler; 20 Feet Electro Silver Plate, and all Pipes and Fittings necessary to connect Boiler and Mill.
Total Weight, About 5000 Pounds.

It requires no belting, shafting, pulleys or building.
Can be transmitted in section or whole. Well adapted to localities difficult of access. Weight, 3000 pounds.
Its practicability was fully demonstrated by its enormous sales of 1895, which exceeded those of two former years, and is now in successful operation in Africa, Alaska, Mexico, Colorado, South America, California, Canada, Montana, Oregon, Central America, Arizona, Dakota, New Mexico, Wyoming, etc.

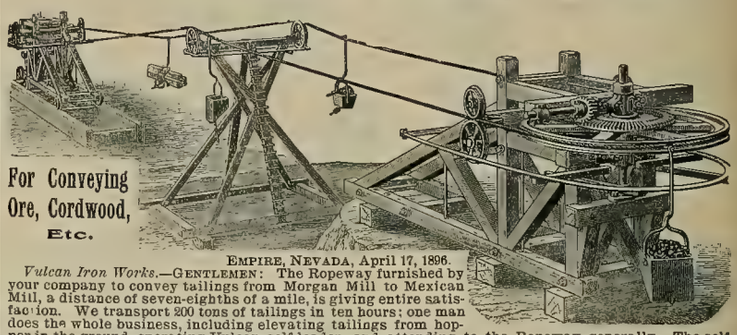
VULCAN ROPEWAY
—WITH—
AUTOMATIC ORE LOADER AND AUTOMATIC DUMPING DEVICE.



For Conveying Ore, Cordwood, Etc.

EMPIRE, NEVADA, April 17, 1896.
Vulcan Iron Works.—GENTLEMEN: The Ropeway furnished by your company to convey tailings from Morgan Mill to Mexican Mill, a distance of seven-eighths of a mile, is giving entire satisfaction. We transport 200 tons of tailings in ten hours; one man does the whole business, including elevating tailings from hopper in the ground, operating Vulcan self-loader, and attending to the Ropeway generally. The self dumper requires no attention whatever. The Vulcan loader I consider the best feature in the whole Ropeway, making it possible for one man to load 200 tons in ten hours.
Yours very truly, J. P. WOODBURY, Supt.

Market Reports.

The Markets.

SAN FRANCISCO, Nov. 12, 1896.

There is a more cheerful and confident feeling in all branches of trade and leading manufacturing circles. Jobbers report more orders coming in for goods, while manufacturers state that they are well supplied with orders, with more being figured on. Hoarded money is coming out for investment, which is calculated to create a better demand for speculative and legitimate investment propositions. It is stated that there is quite a perceptible increase in the inquiry from abroad and from the East for gold mining properties. It is also stated that bonds and better-class securities can be placed now to a much better advantage than one or two months ago. The high and strong market for grain has a very marked and favorable influence on general trade and inspires the belief that it will be felt well into, if not throughout, the coming year.

The local money market is working easier, with the opinion prevailing that before the close of the year there will be a much better feeling in financial circles than has prevailed for a year past. Money is coming out from its hoarding, while the heavy disbursements for farm products, particularly for wheat, is putting large sums of money into circulation. These favoring conditions will have at an early date a decided effect on many languishing industries, and bring about a more general desire for realty, mines and similar investment propositions. Eastern advices are of a decidedly favorable character. The banks report money being redeposited and a better demand from the trade and manufacturers, which indicates improving times. It is stated in well-informed circles at the East that by the end of the current month fully 200,000, if not more, heretofore idle hands will be at work in the different manufacturing industries. This of itself will have a large beneficial influence. A New York journal, just to hand, says that, looking at the matter broadly, it would seem that the prolonged era of cheap money all over the world is coming to an end. At all the European centers, thanks largely to improved business and greatly increased speculation, the low rates have passed away and the inauguration of a period of industrial improvement in this country, bringing with it a great speculation, would unquestionably give New York bankers a good average 4% to 6% market right along.

Mint Director Preston still maintains that the gold production this year will not be less than $220,000,000, against $203,000,000 last year, and an almost uninterrupted increase since 1890, when the world's production was $118,848,700. He says that the political troubles in South Africa and the strike at Leadville have checked output somewhat. The United States yield is expected to be about $50,000,000, South Africa $50,000,000 and Australia perhaps $48,000,000. Colorado is expected to produce this year over $16,000,000; California about the same, and Montana and South Dakota over $4,000,000 each. The Russian output is expected to increase $5,000,000. The silver production of the United States is estimated at $57,000,000.

New York Silver Prices.

NEW YORK, Nov. 12.—Following are the closing prices for the week:

	Silver in—London.	N. Y.
Friday	29 15-16	64⅞
Saturday	30	65⅛
Monday	29 15-16	65
Tuesday	29 15-16	65
Wednesday	29⅞	64⅞
Thursday	29 13-16	64¾

	Copper.	Lead.	Iron.	Tin.
Friday	10 75	2 85	10 25@12 50	13 05
Saturday	10 85	2 90	10 25@12 50	13 05
Monday	10 90	2 95	10 25@12 50	13 05
Tuesday	11 00	2 95	10 25@12 50	13 05
Wednesday	11 00	2 95	10 25@12 50	13 05

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	7@8
Commercial Loans, prime	6@8
Call Loans, gilt edged	6@7
Call Loans, mixed securities	7@8
Mortgages, prime, taxes paid by lender	6@8
New York Sight Draft	Par
New York Telegraphic Transfer	5 c. Prem
London Bankers' 60 days	$4.83
London Merchants	$4.82½
London Sight Bankers	$4.86
Refined Silver, per oz., 1000 fine	64¾
Mexican Dollars	51@52

SILVER.—The market strengthened slightly and then began to ease off, closing weak. The demand is only fair both on this coast and at the East. Following is given the average monthly prices of silver for three years:

	1896.	1895.	1894.
January	67.13	59.69	66.63
February	67.97	59.90	63.43
March	68.40	61.98	59.49
April	67.92	66.61	62.92
May	67.88	66.75	62.96
June	68.69	66.61	62.59
July	68.75	66.75	62.45
August	67.75	66.61	61.83
September	65.68	66.90	64.14
October	64.62	67.64	63.06
November		67.40	65.13
December		66.47	60.43

The shipments from London to the East for the year to October 8th aggregated £4,371,177, a decrease of £581,730. The Indian shipments were £3,251,078, an increase of £403,898; the China shipments £574,413, a decrease of £909,311, and shipments to the Straits £545,686, a decrease of £76,317. For nine months ending September 30, 1895, Great Britain imported £7,973,947 of silver, an excess over exports of £297,574. In 1896 the imports were £10,788,570, while the exports were £439,663 in excess of this amount. During nine months of 1896 Great Britain imported £19,946,712 of gold and exported £20,429,414. In 1895 she imported £27,035,412 and exported £15,327,702 gold.

MEXICAN DOLLARS.—There is a light export movement. Brokers quote 51⅛@52c in a small way, but in large quantities from first hands the price is lower.

COPPER.—The demand abroad is simply enormous. The outward movement from this country is restricted by the scarcity of freight room. The home consumption is enlarging. The market is strong and apparently tending up.

Ingot, jobbing	—@14
Ingot, wholesale	—@13
Sheet copper	—@17

QUICKSILVER. — The market is steady with a continued good demand.

The market is quoted as follows:

Domestic trade, per flask	36 50

For export, quotations are nominal but less than for home.

LEAD.—The markets at home and abroad seem to have found bottom and under smaller stocks and improving consumption are firming up.

Our market is quoted as follows:

Pig	—	@	3 75
Bar	—	@	4 00
Sheet	—	@	5 25
Pipe	—	@	4 50

SHOT.—There is a good seasonable demand.

Drop, sizes smaller than B, per bag of 25 lbs	$1 20
Drop, B and larger sizes, " "	1 45
Buck, Balls and Chilled, do, " "	1 45

ANTIMONY.—Crude is in good demand and slightly higher. Our market is quoted at 7¾@8½c in a jobbing way. New York mail advices quote 7⅞@8c for Cookson's, 6½@7c for Hallett's and 6⅞@6½c for Japanese, from store.

BORAX.—The shipments by rail to the East are said to be increasing.

The market is quoted as follows:

Refined, in car lots	6½
Refined, in sacks	5¾
Powdered, in car lots	5¼
Concentrated, "	5⅝

TIN.—Pig is firmer in sympathy with the East. Plate is steady with firmer feeling.

Pig, per lb	14¼c@ —
Plate, I C coke, heavy, per box	— @$7 05
" " " light, "	— @ 3 95

IRON—The East reports a steadily increasing demand, with the markets firm. With us there is a better demand. It is stated that the consumption in 1897 will probably be the largest in the history of the Coast.

AMERICAN.

	To Arrive.	Spot.

" jobbing, " "	3 30
Cut, carloads, " "	2 95
" jobbing, " "	3 05

Mining Share Market.

SAN FRANCISCO, Nov. 12, 1896.

Business the past week has been light. On Saturday and Monday there was a slight strengthening in prices, but it soon gave way under persistent selling by the bears. There was a steady, sickening decline up to yesterday when a steadier tone was noted, owing to some outside buying for a turn. That slightly higher prices are near at hand is the growing opinion with the better class of operators. While believing that a higher range of values will rule, still they do not think the market will run away, but, on the contrary, go to very much lower figures before the winter and spring months pass. This belief is grounded on reports that moneyed men who can make a market will not do so now but leave it to small pools, and past experience has shown that the latter are content with a few dollars deal in the shares of from one to three mines that are well in hand. The work on the Brunswick lode still attracts attention, but, to an outsider, it looks very much like the monkey shearing the pig—it is all cry and no wool. The fact that the work is being done in a new lode makes the shares of the mines a gamble. Take, for instance, Chollar the past week. The official letter reports a three-foot vein of $35 ore on the 650-foot level in the Comstock workings, but it had no effect on the market price of the shares. If this ore had been struck on the Brunswick lode the shares would have moved up one or two dollars. The work on the Comstock lode indicates that the most important will be discontinued before long and new work started from which nothing but assessments can be looked for. In the Bodie shares there has been the usual few cents up and down. This is done to concentrate shares.

From the Brunswick lode the news is not of an unfavorable character, although the decline in the market value of shares would indicate it. In Occidental work is continued on several levels, and while nothing of large value has been made public, still those in charge express themselves as well pleased with the general situation. It will take considerable time, work and expenditure of money before definite results can be known with any degree of positiveness. In Chollar connection has been made between the 200-foot level and the surface. On the 300-foot level exploiting work is still the order. The south drift on the 400-foot level has been turned so as to be used as a crossdrift with the view of striking the downward continuation of the ore found above. In Hale & Norcross sinking of the shaft is continued as is the crossdrift on the 400-foot level. When in about 30 feet the ledge was struck and, at last advices, it was being croosscutted to find its value, if any; so far it is disappointing. In Savage and Gould & Curry considerable work is being done, and generally in favorable formations. This work is being closely watched by mining men as is the east joint crossdrift on the 300-foot level in Best & Belcher and Gould & Curry.

Mail and telegraph advices from the Comstock mines are not materially different from last week's published news. The general outlook, judging from official letters, points to longer time and more work before the powers that be are ready to show up much ore. It looks now as if the result of the recent work in two or more of the mines will die a dead secret, so far as the public is concerned, but it is reasonable to conclude that it was very favorable or else it would have been given out. In the Alta group work is only being done by Alta, and this shows no particular change. In Overman a few tons of ore are raised while prosecuting work on second level. No ore was raised the past week by Seg. Belcher. The work that is being done is not reported, and has not been done for many months past. The same remarks apply to Belcher, although the latter raised about sixty tons of ore the past week.

In Crown Point exploiting work is continued in several levels. Seventeen hundred and seventy-nine tons of gold-bearing ore have been milled, which returned about $6 to the ton. This will hardly pay expenses. A small quantity of good ore was milled which returned over $40 to the ton. No advices are to hand from Yellow Jacket. The news from Confidence and Challenge is about the same as heretofore reported. In Con. Imperial they are still pushing the joint Confidence, Challenge-Con. Imperial west crossdrift. Work on the other west crossdrift was discontinued some time ago and work on the north lateral drift from the end of the west crossdrift was resumed. It is said that the ore on this level was taken out through another mine and not accounted for, which accounts for the old fillings found in the drift. In Alpha the work, it is said, is still being done as if not to find the rich gold-bearing ore run into a few years ago. The work in Bullion is essentially unchanged. In Potosi work is continued on the croppings and also on the 450-foot level, but nothing new was reported during the week. In Chollar they are exploiting on the 450-foot and 650-foot levels. On the latter level they are following a 3-foot vein of $30 to $35 ore. The official letters from these two mines, and also from Savage, give the assays in gold and silver, the same as has been done by Hale & Norcross for nearly a year past. This is quite an improvement and not so misleading as when the two metals are given separately.

In Hale & Norcross the work is practically unchanged. In Savage exploiting work is being done on several levels, and it is said that it is quite favorable on one of them. The joint Best & Belcher and Gould & Curry east crossdrift is being pushed steadily ahead. The work under way in Con. Virginia is on the same levels and in the same direction as reported last week. Those directly interested are watching with considerable interest the work to the east on the 1650-foot level and that to the west on the 1000-foot level. The number of tons of ore raised and assay value were less than last week. The work in Ophir is continued on the Central Tunnel and 1500-foot levels. As it is to the west, mining men watch it with close attention, but even there work can be done and no one outside of a very few know anything about it. In Mexican, Union Sierra Nevada, Utah and Andes work is continued on the same levels and in the same direction as heretofore reported, with no marked change in the material encountered reported in official letters.

The following illustrates the changes of the week:

Mines.	Nov. 5.	Nov. 12.

ANNUAL MEETINGS.

Company and Location.	Secretary and Office in S. F.	Date.
Occidental Con M Co	Alfred K Durbrow, 309 Montgomery	Nov 16

THE SANTA ROSA GOLD MINING COMPANY.

Properties located in the Cripple Creek Gold Mining District.

We believe we can give you the largest prospective value for the least money.

Investigate carefully; hesitate before buying other stocks; consider SANTA ROSA and know why you don't want it.

Call, write or telegraph to F. H. PETTINGELL, 10-11 Bank Block, Colorado Springs, Colo.

ANNUAL MEETING.—The Regular Annual Meeting of the stockholders of the Occidental Consolidated Mining Company will be held at the office of the Company, Room No. 69 Nevada Block, No. 309 Montgomery street, San Francisco, California, on MONDAY, the 16th day of November, 1896, at the hour of 1 o'clock P. M., for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such other business as may come before the meeting. Transfer books will close on Friday, November 13, at 3 o'clock P. M.

ALFRED K. DURBROW, Secretary.

The Jno. G. Morgan Brokerage Company,

BANKERS and BROKERS,

No. 1630 Stout Street.

Telephone 1293.

DENVER, COLO.

STOCKS, BONDS, GRAIN AND PROVISIONS.

Direct private wires to Chicago, New York, Cripple Creek, Colorado Springs and Pueblo.

Orders executed in large or small amounts for cash or on *reasonable* margins. Out-of-town orders by mail, telephone or telegraph will receive prompt attention. Daily market circular mailed free on application.

Assessment Notices.

CHALLENGE CONSOLIDATED MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Gold Hill Nevada.

Notice is hereby given that at a meeting of the Board of Directors held on the 14th day of October, 1896, an assessment (No 22) of Ten (10c) Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 35, third floor Mills building, corner Bush and Montgomery streets, San Francisco Cal.

Any stock upon which this assessment shall remain unpaid on the 17th day of November, 1896 will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on TUESDAY, the 8th day of December, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

C. L. McCOY, Secretary.

Office—Room 35, third floor Mills building, corner Bush and Montgomery streets, San Francisco, Cal.

THORPE MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Calaveras County, California.

Notice is hereby given that at a meeting of the Board of Directors held on the 14 h day of October, 1896, an assessment (No. 4) of five (5c) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, No 507 Market street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 12th day of December, 1896, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on SATURDAY, the 9th day of January, 1897, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

A. F. FREY, Secretary.

Office—No 507 Market street, San Francisco, Cal.

GREENWOOD GOLD MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Greenwood, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 16 h day of October, 1896, an assessment (No. 1) of two (2c) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 79, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 23rd day of November, 1896, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 14th day of December, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHAS. E. ELLIOT, Secretary.

Office—Room No. 79, Nevada Block, No. 309 Montgomery street, San Francisco, California.

GOLD RIDGE CONSOLIDATED MINING AND MILLING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Nevada and Sierra Counties, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 20th day of October, 1896, an assessment (No. 5) of two and one-half (2½c) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Rooms 12 and 13, No. 43 Sixth street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 21st day of November, 1896, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 14th day of December, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

WM. F. McLAUGHLIN, Secretary.

Office—Rooms 12 and 13, No. 43 Sixth street, San Francisco, California.

DELINQUENT SALE NOTICE.

GOLD BAR CONSOLIDATED MINING COMPANY. Location of principal place of business, San Francisco, California. Location of works, near La Porte, Plumas county, California.

Notice. There are delinquent upon the following described stock, on account of assessment (No. 4) levied on the Thirteenth (13th) day of July, 1896, the several amounts set opposite the names of the respective shareholders as follows.

MINING AND SCIENTIFIC PRESS,

220 Market Street.....**San Francisco, Cal**

Assaying.—Part I—Gold and Silver Ores.
Third edition; Just Out. Rewritten and Improved by the Author, C. H. Aaron. Embraces 130 12-mo pages, with illustrations; well bound in cloth; 1896. Price, postpaid.....$1 00

Assaying.—Parts II & III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.
Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid.....$1 75

Notes on Assaying and Assay Schemes.
By P. De Peyster Ricketts, E. M., Ph. D., Professor in Assaying in the School of Mines, Columbia College, N. Y. Prepared with special reference to the wants of the student and practical assayer. Containing also Rules for the Examination of Mines, Assayer's Outfit, Treatment of Ores, etc. Fifteenth edition. 8vo., cloth.....$3 00

Prospector's Field Book and Guide.
By H. S. Osborn.....$1 50

A Practical Guide for Prospectors and Miners.
By C. W. Moore. With numerous illustrations.....$4 75

Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.
Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, postpaid.....$3 00

The Lixiviation of Silver Ores with Hyposulphite Solutions.
With special reference to the Russell Process. Second edition. Completely revised. By Carl A. Stetefeldt. Price, bound in cloth.....$5 00

Dr. R. W. Raymond, in reviewing the book, says: "Mr. Stetefeldt's book is a model of terseness and clearness. * * * His contribution to the literature of the subject takes its place among the valuable professional treatises which have, in recent years, reflected honor upon American metallurgists."

Modern Copper Smelting.
By Edward Dyer Peters, Jr. Seventh edition. Rewritten and greatly enlarged. The standard authority of the world in Copper Smelting. Profusely illustrated.....$5 00

Losses in Gold Amalgamation.
By W. McDermott and P. W. Duffield.....$2 00

Electricity in Mining.
By Sylvanus P. Thompson.....80 cts.

Practical Treatise on Hyaraulic Mining.
By Aug. J. Bowie, Jr. This new and important book is on the use and construction of Ditches, Flumes Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc A very practical work for gold miners and users of water. Price, postpaid.....$5 00

Practical Hydraulics.
A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid, $2

The Metallurgy of Silver.
By M. Eissler. Profusely illustrated.....$4 00

Manual of Hydraulic Mining for the Use of the Practical Miner.
By T. E. Van Wagenan.....$1 00

Manual of Mining.
For the use of Mining Engineers and Technical Schools. Treating of Preparatory and Exploratory Work, Methods of Mining, Hoisting Machinery, Pumping, Ventilation Shafts, Tunnels, Blasting, Timbering, etc., etc. By Prof. Magnus C. Ihlseng, E. M., Ph. D. Second edition, with Appendix. 500 pages, 8vo., cloth.....$4 00

The Explorer's and Assayers' Companion.
A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid.....$6 00

Aaron's Leaching Gold and Silver Ores.
By C. H. Aaron. The most complete handbook on the subject extant; 164 pages, octavo. Illustrated by twelve lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, postpaid.....$3 00

The Metallurgy of Gold.
By M. Eissler. Profusely illustrated.....$5 00

A Text Book of Mineralogy.
Based upon the System of Mineralogy of Prof. J. D. Dana. Embracing an extended Treatiee on Crystallography and Physical Mineralogy. By Edw. S. Dana, Curator of Mineralogy, Yale College. With upward of 800 woodcuts and one colored plate. Seventeenth edition. 8vo., cloth.....$3 50

Notes on the Treatment of Gold Ores.
By Florence O'Driscoll, Associate Member of Institute of Civil Engineers. 8vo., cloth.....$2 00

A Practical Manual of Minerals, Mines and Mining.
By H. S. Osborn.....$4 50

Cyanide Processes for Gold and Silver Ores.
By E. B. Wilson, E. M. 12mo., cloth.....$1 50

Practical Metallurgy and Assaying.
By A. H. Hiorns.....$1 50

The Practical Metal Worker's Assistant.
By Oliver Byrne. Illustrated.....$5 00

Confusion of Mining Laws.

Almost universally favorable comment is noted in the journals of this State regarding proposed changes in the mining laws submitted by the MINING AND SCIENTIFIC PRESS to the California Miners' Convention. In a very few a wrong impression is given of their object. In the Redding *Free Press* it is claimed that "their practical effect would only add to the complications that already exist," and that "there is no class of our citizens who are confronted with so much unnecessary red tape in securing title to any part of the public lands as the miner."

The locator now is surrounded with more red tape than he would be under the proposed laws; but it is red tape cut up into short bits that he is unable to put together. Under the present system of locating mines in California, some things that are considered necessary to be done have been declared useless by the courts. Other things that the locator considers of little importance have been declared by the courts as vitally necessary. Then again the decisions of the courts have been conflicting, and the result is that no one knows just what should be done.

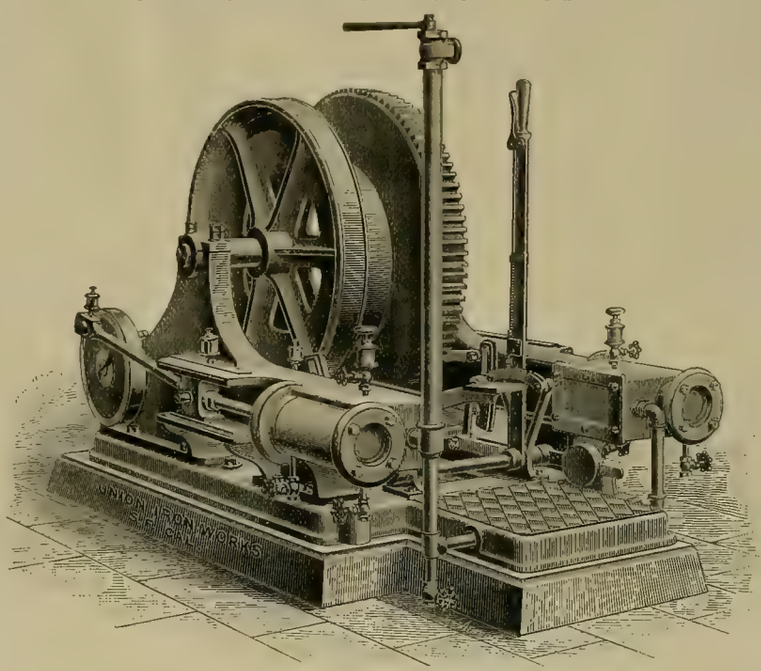
This is best evidenced by the fact that the MINING AND SCIENTIFIC PRESS has been called upon for many years to answer more inquiries on this subject than upon any other.

For example, the locator looks upon the posting and recording of the notice as one of the best evidences of his title. Yet the Supreme Court has lately held that in the absence of State or district laws no such notice is necessary.

The want of State laws on the subject of locations has left the locators to their own devices. The result has been a most fruitful source of litigation, most of which would have been avoided by statutes of the State covering the points that the Federal statutes expressly invite the several States to cover.

As to the proposed laws in this respect, we believe that they are as simple as they can be made and yet comply with the Federal statutes in the case.

To comply with the requirements proposed would give no more work to the locator than the present system. And, what is of more consequence, when he had complied with the proposed law, if passed, he would feel a sense of security that few locators have now. Under the present system locating is largely done by guesswork as to what is or is not really necessary to be done. The Federal statutes provide in a very general way that certain things shall be done in a manner to be prescribed by the State or local rules and customs. The State has not prescribed the manner in which these things shall be done, and in most mining districts of the State there are no local customs now in force. The Federal statute is so very general that not only has there been doubt and confusion among the miners as to what is required, but the courts themselves disgree upon many points. If there is any advantage in security of title to mining property, some laws such as are proposed are a necessity.



HOIST FOR PROSPECTING.

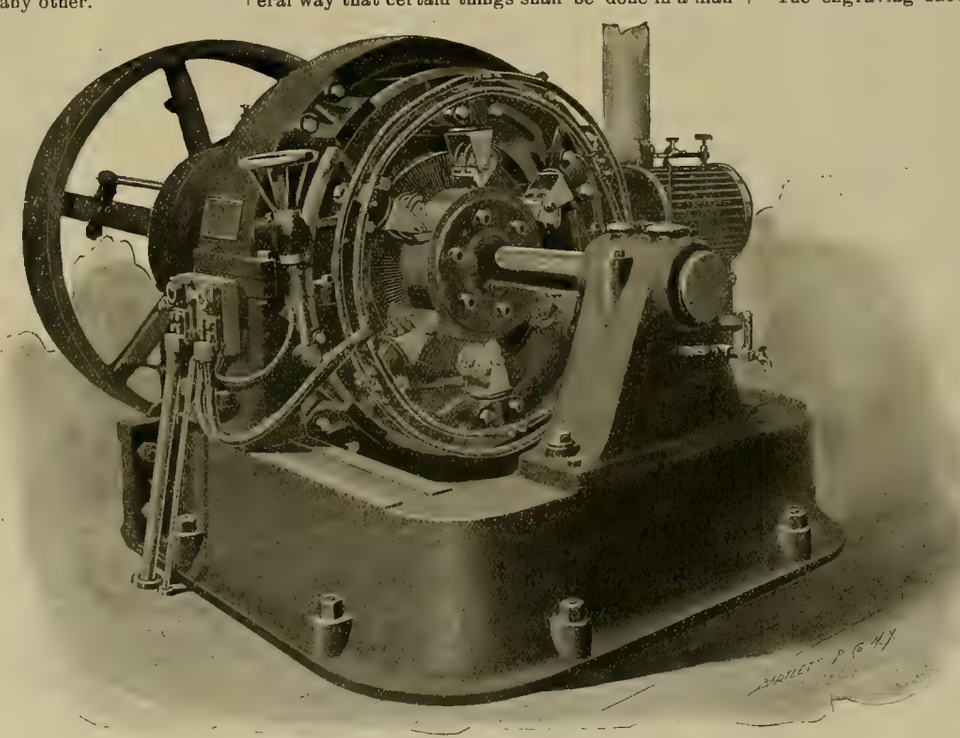
Prospecting Steam Hoist.

We illustrate on this page a small double cylinder, single drum hoist for prospecting purposes or for underground work, using compressed air. The entire hoist is self-contained, being mounted on an iron sole plate or bed, which carries all the operating levers and provides a foot board for the operator.

The engines are provided with reversible link motion and the drum with a broad strap brake, insuring safe and rapid work. The general lines upon which this hoist is designed are neat, strong and substantial, and all the operating parts seem to be conveniently arranged. The illustration is taken from the 4-in.×10-in. size, rated at 15 H. P. The larger sizes, 8-in.×12-in. and upwards, are provided with post brakes.

Generator for Isolated Lighting.

The engraving shows a new style generator for isolated lighting plants, designed by the Walker Co., Cleveland, O., direct connected and of the multipolar type: the bed of the engine and the generator are one casting. The pole pieces receiving the coils are of laminated wrought iron, cast welded into the frame. The machine does not dispense with a pole shoe as is done in some dynamos having laminated pole pieces, but has a shoe which is claimed to distribute the magnetism properly through the armature, minimize the power necessary for the magnets and form a supply for the field coils, enabling them to be easily removed.



GENERATOR FOR ISOLATED PLANTS.

In the Kootenay district fully five times as many mines will be in operation this winter as last. Rossland has grown in one year from a town of 2500 to a city of 7000. Trail has grown in the same period from 100 to 2000. Burton, Waterloo and Deer Park were unknown on the map last spring.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Hoist for Prospecting; Generator for Isolated Plants, 417. Multiple Drilling Machine, 422.
EDITORIAL.—Confusion of Mining Laws; Prospecting Steam Hoist; Generator for Isolated Lighting; Mining Activity in British Columbia, 417. How a Secretary of Mines May Be Secured; The Proposed "Placer" Law; What Cheap Methods Mean; Morality of Miners; The Mine Owner and Government Bureau; Local and Foreign Investors; Mining Laws in Alaska, 418.
MECHANICAL PROGRESS.—Multiple Drilling Attachment; Shotgun Barrels; Compressed Air on a Warship, 422.
SCIENTIFIC PROGRESS.—Pneumatic Tubes in the Postal Service; Making Diamonds, 422. Tricks of Ancient Gold Workers; A Remarkable Institution; To Convert Fahrenheit into Centigrade Degrees, 423.
ELECTRICAL PROGRESS.—Niagara on Tap; New York and Brooklyn Tunnel; A Noiseless Electric Motor, 423.
PRACTICAL INFORMATION.—Cost of Labor Wars; The President's Term of Office; The Government's Coast Defense Guns; A Large Timber Area; A Recollection of Ancient Literature; To Restore Burned Steel Tools, 423.
MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 426-7.
THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 434.
MISCELLANEOUS.—Concentrates, 419. The Relation of Geology to the Development of the Mineral Resources of the State, 420. Laboratory Tests in Connection with the Extraction of Gold from Ores by the Cyanide Process, 421. Dredging versus Impounding Debris; It Does Not Pay, 422. Coast Industrial Notes; Personal, 425. Prof. Emmens' Discovery; List of Patents; Notices of Recent Patents, 428. Recently Declared Mining Dividends; Recent California Mining Incorporations; Commercial Paragraphs, 435.

How a Secretary of Mines May Be Secured.

The movement for the establishment of a Department of Mines in the Federal Government is gaining strength daily. Good work has been done in this State by the Miners' Association; the newspapers are taking up the matter, notably the *Call* of this city, and from the interest manifested it may safely be said that California will do her share toward accomplishing the end in view. A joint resolution will be presented to the Legislature when it meets in January, recommending that Congress take action. In the Northwest the Mining Association and the press are doing all that could be expected. The papers in Colorado and other States in which gold and silver mining is the leading industry have fallen into line.

But this is not enough. What is wanted, and what will insure the success of the movement, is the co-operation of the great mining industries of the East. If the States in which coal, iron and copper mining are leading industries would see to it that their representatives in the House and their senators vote for the measure, it would pass with little opposition.

The value of the coal product of Pennsylvania in 1895 was over $36,000,000; of Illinois, over $16,000,000; of Ohio, over $12,000,000; and of West Virginia, Alabama, Iowa, Indiana, Washington and Colorado, over $4,000,000 each. The leading States in the production of iron were Pennsylvania, Ohio, Illinois, Alabama, Virginia, Tennessee and New York. Michigan produced over $20,000,000 worth of copper.

A concerted movement on the part of the States named would be all that would be required.

The Proposed "Placer" Law.

Land Commissioner Lamoureux's decision in favor of the Northern Pacific against a placer claimant promises to give him some discomfort during the short session of Congress. Since we called attention to the case, and presented the proposed bill for remedying the evil which the Commissioner is striving to accomplish, the newspapers all over the West have given the matter consideration and heartily endorse the movement to clip his wings.

The other day Senator Teller of Colorado, in speaking of the decision of the Commissioner, said that the former rulings of the Land Office which have been reversed in this case have been in existence for the last half a century, and that he could see no special reason for the position taken by Lamoureux.

"I have no doubt," said he, "that if the bill proposed by the California miners comes before Congress to put the practice of the department into the form of statutory law it will be passed, unless the Secretary of the Interior should reverse the decision of his subordinate. It has always been customary to put sulphur, borax, alum, kaolin and like minerals not in place under the provisions of the laws governing placer claims, and I fail to see any reason why they should not be still maintained in that category. The bill will certainly receive attention if it comes before Congress."

What Cheap Methods Mean.

It is probably no exaggeration to say that but for the reduction in the cost of mining and milling brought about by new methods within the past ten or fifteen years more than half the mines in the world now being worked would never have been opened. On the Rand in South Africa much of the ore that is being worked to-day would not have paid under the methods in vogue three years ago. There the cost of working tailings by the cyanide process has been almost brought down to 50 cents per ton on the larger plants.

In his address before the Miners' Convention Prof. Christy of the State University said: "And this much is certain, that any mine owner who is discharging tailings averaging over 50 cents a ton would do well to save them." A few years ago such a statement could not have been made.

Aside from the fact that the reduction in the cost of working ores gives a larger profit to the mine owner there is a much larger view to be taken of the matter, and it is that the reduction in cost has added countless millions of wealth to the world in making of value immense ore deposits that were before worthless.

Many millions, of course, have been irretrievably lost in the past through the crude methods of working. Much has gone off in the tailings and much ore that would now pay to work has been left in the old workings of the mines, where it cannot now be reached, owing to the breaking down of the ground.

Colorado miners estimate that there are $30,000,000 in low-grade ores on the dumps that will now pay to work. All over this State a great deal of such ore is now being worked at a profit.

Morality of Miners.

A man who claims to have visited British Columbia during the past year writes to the Liverpool *Post* to warn English girls against emigrating to the mining districts of that province, and says:

The inhabitants are chiefly men of the lowest possible type, who gain a livelihood by gold mining, and vary their occupation by following the profession of gamblers. The astounding number of drinking saloons in proportion to the population, which one invariably finds in these towns, is a sufficient proof even to a casual visitor of their bad character, but the real depth of their vileness can only be fathomed after a considerable stay. They are then found to be veritable dens of iniquity—foul blots on their magnificent surroundings, and certainly not the places where we would wish our sisters to find husbands.

Such a palpable, bald slander, if published in this country, where the character of the gold miners is so well known, would not be taken seriously. But, published in one of the most reputable of the great English dailies, it may do considerable harm.

The gold miner of the Pacific coast of to-day has many of the characteristics that won for the men of '49 the respect of all who understand them. This is especially true of the miners in the newer districts. Probably the fact that the miner does his drinking and gambling openly, and not secretly, will impress the casual visitor wrongly. The honest miner is in the habit of doing all things openly and allowing the world to judge him by all he does, rather than trying to show only his best side.

The Mine Owner and Government Bureau

The United States Geological Survey has for several months had a corps of surveyers about Butte, Montana. In order to make a thorough examination of the mineral deposits of the great copper district and obtain the desired data it was necessary that they should be permitted to examine the mines. In most cases this permission was freely given. It was with difficulty, however, that the privilege was finally obtained from one or two of the largest mines. In this State the Mineralogist in his annual report tells of considerable difficulty experienced by his field assistants in obtaining access to the mines during the past year. In many cases, and particularly large mines, they were absolutely refused permission to make examinations.

It is from such sources that the most valuable data may be obtained by geological surveys and mining bureaus. Information so gathered would be of practical use. Were there any good reason for refusing permission to the surveyors to examine the mines, the owners who refuse might be excused. But there is not. The information required is mostly obtained from the older workings and there is no need for the surveyors to gather and publish any information except such of a general nature that could not in any way affect the mine owners' interests.

It has been suggested in this connection by the State Mineralogist that a law be passed compelling the mine owners to allow access to the mines. Such a law would be of value only as to a very small proportion of the miners of this State, for it seems that very few upon a proper understanding of the matter would object.

There is no desire on the part of the Mining Bureau or the Geological Survey to pry into any of the private affairs of the mine owner, and they should certainly know that the Bureau and the Geological Survey are engaged in work in their interest.

Local and Foreign Investors.

The advent of the foreign speculator for the purpose of purchasing California mines is looked upon with alarm by some, who believe that a large proportion of the best mines will soon be taken up and owned abroad. It is unfortunately true that too large a proportion of the mine owners would rather sell mines than work them. Then, of course, many of them have not the necessary capital to properly develop their properties. However, there has been a large increase within the last year of that best class of miners—men who are looking for mines to work for the profits to be made, rather than for speculation. They, and not the speculators, are the men who will do most for mining and who will add dignity to the calling.

The great change in sentiment in reference to that industry that has taken place within the past few years is best illustrated by the San Francisco "down-town business men." A few years ago an offer of a mining investment to one of these men would have made him throw up his hands in horror. He would explain that he never gambled.

Now all that is changed. More money has probably been invested in the mines of this State within the past year by San Francisco business men than by any other class. They have learned that mining may be conducted as any other legitimate business enterprise, and the fact that they have learned this means much for the future welfare of the industry, and particularly for the welfare of California. It means that not only a large proportion of the profits of the mines will remain at home, but, more than that, it means that mining will be conducted as it should be, by careful and conservative men, who are looking for investment for their money in a business that, economically and carefully managed, will give them large profits. They will be much more interested in new methods of mining and milling than in the machinations of stock dealers or promoters.

The day of pure speculation in mining is fast passing away the world over. The big English syndicates which are looking for mines to offer in the London market expect to buy only mines which they can practically guarantee to their clients. The good work done for English syndicates by California engineers, and the splendid reputation they have made as a class for integrity, has given them a standing in London that enables them to do much toward turning capital to this State. It is to be hoped that this new interest of foreign capitalists will further stimulate local capital to rival them in seeking investment here.

THE general mining laws of the United States have been for a number of years extended to Alaska, but not so with the general land laws; and it is practically impossible to perfect title to any ground except mineral in that country.

Concentrates.

TEN stamps will soon be added to the mill at the Bigelow mine at Sierra City, Cal.

CAPTAIN T. H. MERRY of Hueneme, Cal., recently discovered a gas well off shore in that vicinity.

THE Denver *Mining Industry and Review* reports an "exodus" from Colorado to Mexico since the election.

DURING October Cripple Creek, Colorado, incorporated mining companies paid dividends aggregating $168,000.

M. MCVEIGH, owner of the Live Oak mine in Clapboard gulch, Amador county, Cal., is arranging to erect a mill.

BUT forty-one days remain in which to do the required $100 worth of work or improvements on unpatented mining claims for 1896.

THE resumption of work at the borax mines at Calico, San Bernardino county, Cal., will cause the employment there of 200 men.

CONSIDERABLE success in working the mines on the Colar gold fields has attracted attention to India as a field for exploration.

THE Director of the United States Mint estimates that the world's output of gold for 1896 will be $220,000,000—an increase over last year of $17,000,000.

THERE are 438 stamps in present operation in Alaska. The '95 gold output of the Territory was $3,000,000. The estimated output of '96 is $4,500,000.

A COMPANY with a capital of $100,000 has been formed to work a gold mine discovered near Paris, Texas. There is considerable prospecting going on in the neighborhood.

EXPERTS have been making examination of W. E. Chapman's Taylor mine in El Dorado county for English capitalists. It is reported that the mine has been offered for $500,000.

IT is generally of much more interest to a mining man to read of the discovery of a 10 or 20-foot ledge of $10 ore than the reports of small ledges that go away up in the thousands.

ON the Rand, in South Africa, the natives are rebelling against the reduction in wages decided on by the mine owners and many are asking for passes in order to leave the districts.

AN order has been issued in the District Court of Arizona permitting the sale of the Vulture mine under the terms of a trust deed given by Senator Tabor of Denver for security on loans of $23,000.

COLOMA, in El Dorado county, where Marshall made the discovery of gold in California, is now noted as the center of a small district from which come the best peaches shipped to Eastern markets.

IT is expected that the Colorado Eastern railway will soon run into the Yellow Pine mining district in Lincoln county, Nevada, where, it is said, it may obtain nearly 1000 tons of ore daily for freight.

THE California Exploration Company will soon supply Mokelumne Hill, which is within a mile of their plant, with electric lighting. The ground has been surveyed and stakes set as far as San Andreas.

LAST week at the annual meeting in London of the Con. Gold Fields Co. J. H. Hammond, the company's general manager, made a favorable report on deep level mining in the Rand, South Africa, district.

THE estimated copper output of the State of Montana for October is between 20,000,000 and 25,000,000 pounds. Of this the Anaconda is credited with 10,000,000 pounds and the Boston & Montana with 5,000,000 pounds.

ON Rogue river, in southern Oregon, Newell and Iliff have purchased heavy pumps to force water from the river direct against their gravel banks for washing. Two such plants were in successful operation last winter.

OIL PRODUCERS of southern California are looking forward to better prices. They claim that the product will soon fall below the amount desired for consumption unless new territory is developed more rapidly than during the past few months.

AFTER the adjournment of the miners' convention in this city last week a number of delegates from different parts of the State went up to Grass Valley and Nevada City as guests of the Nevada county delegation to visit some of the large mines.

THE Anaconda Copper Mining Company paid a dividend of $1,500,000 last month to its English shareholders, who purchased it for $34,500,000. Now it is reported in Montana that before the end of the year a dividend of $3,000,000 will be declared by the company.

CRIPPLE CREEK, Colorado, is expecting a boom from an influx of outside capital. It is claimed that brokers are besieged with orders for properties to be placed in the East, and that there are a number of English, French and German investors now in the camp.

ON the last pay day the forces of miners in the principal Gold Hill, Nev., mines were reduced as follows: Crown Point from 72 miners to none, only watchmen are now in charge; Belcher from 33 to 16; Confidence from 9 to 8; Challenge Con. from 5 to 4; and Con. Imperial from 8 to 7.

IN the past two years twenty-five hydraulic mines have been started up in Plumas county, all with storage dams, all working successfully. This means a great deal for that section—money coming out of the ground, ready cash market for products, schools, civilization, industry.

THE Anaconda, Montana, copper mine is announced to overtop all previous records in mine dividends by declaring this month a dividend of $1,500,000, recalling the days when in this city Con. Cal. & Va. declared a monthly dividend of $2 on each of the 540,000 shares of stock.

LA MADRUGADA, in the Topia district, Durango, Mexico, is said to be enjoying a boom. It is estimated that the value of the ore in sight is over $5,000,000. The company owning the mine contemplates building a narrow-guage railway from a point near Topia to Culiacan, capital of Sinaloa.

ACCORDING to the annual Blue Book on the mineral statistics of Great Britain the value of all the lead, zinc, copper, tin and other metallic ores except iron did not exceed £750,000, and the *Mining Journal* says in this connection that British metal mining is, therefore, in a dying condition.

UNDER the laws of Russia all gold and silver mined must be registered and taken to the Imperial mint, which has agencies established for convenience in collecting. The mines are the property of the crown, and a certain percentage goes to the Imperial treasury. The result of this is that more or less is concealed; yet the production last year was placed at $34,000,000. In most of the rich districts the methods employed are very crude. To remedy this a number of experts have been called upon from California and other places to go there of late.

TO CORRECTLY approximate the number of mines, mills and working miners in the State is not practicable. The lists published in these columns in serial form from April to September, '96, indicate that there are about 18,000 miners in the State, about 3,300 mines and 600 stamp mills, comprising 6,500 stamps.

LEADING mine owners and managers of Colorado propose organizing a State Mining Association. The Colorado plan embraces the idea of having none eligible for active membership but those actually engaged in mining, which is not without its advantages. The headquarters of the Association is to be in Denver.

THE laws of Montana provide that the Secretary of State shall charge 50 cents for each $1000 of capital stock of any corporation filing its certificate. In order to avoid this, companies have been organizing with a capital of a few thousand dollars, and shortly afterwards increasing the capital to the desired amount.

THE Mines Department of the New South Wales Government offers a reward of £500 for the discovery of a new gold field, provided that within six months not less than 300 miners shall be profitably employed in it. In case there are 500 miners at work within twelve months, an additional £500 reward will be paid.

THERE have of late been more than the usual demands for placer miners for South America. Robert Williams, a brother of Gardiner Williams, who has charge of the Kimberley diamond mines, left some weeks ago. R. O. Laws has gone from Trinity county, and now Henry Meegan, who has been mining on Snake river in Idaho, has gone to Venezuela.

THERE has never been any law, any statutory provision, against hydraulic mining in this or any other State; a decree of a court and injunctions under that decree have interfered with operations of hydraulic mining in this State, the miners in general complying therewith, but, thank Heaven, hydraulic mining is not "illegal" in this commonwealth.

IN a gravel mine at Cherokee, Butte county, the owner claims that owing to lightness and toughness of the ground he washes it four times. The first washing only brings from $4 to $5 to the man per day, but the second about $7 to the man, and the third from $6 to $7 to the man per day. The tailings are left to dry out well and after wheeling 1000 yards a fourth washing yields $3 to $4 to the man.

A CORRESPONDENT of the *Wall Street Reporter* writes from Durhamville, New York, of the discovery of gold quartz veins there, lately mentioned in this column, which show assays running from $25 to $900 per ton. He says that he has thirty-two claims in St. Lawrence county and has discovered mines enough in the State to flood the gold market for ten years. He admits that the statement may seem incredible.

GREAT SALT LAKE, Utah, has for several years been furnishing a good part of the surrounding country with salt. Lately the salt company, while driving some piles, discovered a stratum of sulphate of soda, or glauber's salt, with a slight mixture of silica, which can be easily separated. It is claimed that there is sufficient quantities to make the discovery of value. Most of our sulphate of soda comes from Europe.

FROM February 1, 1896, to November 1, 1896, there were coined at the United States mints 16,262,922 standard silver dollars from the silver bullion on hand purchased under the act of July 14, 1890. The seigniorage upon this amount was $5,051,430. Silver bullion purchased under the act of 1890 on hand November 1, 1896, was 125,061,263 fine ounces, which cost the Government $112,865,625. The coinage value of this amount is $161,693,000.

REPRESENTATIVES of Barney Barnato, the South African mining king, are reported to have secured control of practically all the mining property in Lake of the Woods and Rainey River districts in northwestern Ontario. Mr. Barnato denies the statement. Whether Barney Barnato is behind the men or not it is certain that representatives of English capital have gone to those districts to secure control of properties, attracted by the representatives of some leading Canadian mining men.

THE last three payments on the Prize mine, in Deer Lodge county, Montana, which was sold some time ago by the Murray brothers to Irwin C. Stump and others, was made on November 3d, and the property is in the hands of the new owners. The purchase price was $45,000. This is a mine that was offered in London a few months since for £150,000, or, rather, shares were offered at that rate in a company formed to purchase and operate it. Of this sum, £120,000 was to go to the vendors and £20,000 for working capital.

THE Miners' Protective Association of Tuolumne county offers a standing reward of $150 for evidence that shall lead to the conviction of any person for stealing gold dust, amalgam or quicksilver from any mining claim, tunnel, sluice, under-current, riffle-box or sulphuret machine, the property of any member of said Association, and a reward of $50 for evidence that shall lead to the conviction of any person for stealing from any mining claim belonging to any member of the Association tools of a value under $50.

THE Cowenhoven Railway Tunnel and Drainage Company of Aspen has been incorporated, with a capital stock of $1,000,000, for the purpose of completing the Cowenhoven tunnel from Smuggler mountain to Lenado, the principal mining town of the Woody district, on the Aspen contact. From there a road is to run northeasterly to the town of Thomasville, to a junction with the Colorado Midland road in Pitkin county, thence northeasterly again to the town of Minturn in Eagle county, and to a junction with the Denver & Rio Grande road. In addition a branch line will be built from Thomasville to Ruedi in Eagle county.

ACCORDING to a late estimate in the Alaska *Mining Record*, the output of gold in Alaska this year will be over 50 per cent larger than last year, when it was about $3,000,000. The total for this year is placed at $4,670,000, of which $2,355,000 comes from quartz mines and $2,450,000 from placers. While these estimates are probably rather high, there can be no doubt that there has been a large increase over last year's output and that a further increase will be noted next year. Not only are a number of large, new quartz mines being made productive, but the placers will no doubt be worked more systematically and intelligently. Of the large number of people who went to Alaska last spring many will not go again. Their absence will not be a drawback. Of those who will go up in the spring, there is every indication that a larger proportion will be intelligent miners, prepared by experience and equipment for good work.

UNIVERSAL attention is being directed to the revival in gold mining. The famous article on "The Flood of Gold" is being copiously paraphrased. It is not likely, however, that there will be an immediate demonetization of the yellow metal. In view of this increase, the position of silver is interesting. On one side it is argued that silver will increase in price through a change in ratio, and ultimately recede under the stimulus of "overproduction;" on the other hand, there are many who hold that silver will exhibit a constantly appreciating ratio with gold. Above and beyond ordinary "political" questions, these matters have the most important bearing on the world's commercial destiny.

THE Canadian Government is doing good, timely work in the way of making examinations of the mining districts of British Columbia. W. A. Carlyle, the Government Mineralogist, published a short time ago a report upon the mines of the Trail Creek district, and has lately been on the Slocan and about Toad mountain and other localities. R. G. McConnell of the Dominion geological survey department has been examining the geology of certain parts of the Kootenay country. While Mr. McConnell is examining the geology Mr. Carlyle has been examining more particularly the mines themselves. One of the main duties of Mr. Carlyle's office is to collect and publish reliable statistics of the products of the mines.

A BILL has been drafted by the Minister of Mines of Victoria, Australia, providing for the expenditure of £140,000 by the Government to assist in the development of mining. According to the provisions of the bill, £75,000 may be set aside for assisting companies which are doing pioneering work, but only £25,000 can be spent annually. The money is to be expended in sinking or driving, or in obtaining machinery and appliances for carrying on such pioneering mining. For each pound of assistance received the companies must expend a pound of their own money. The repayment of this is to be made a charge on the first profits. Part of the rest of the proposed appropriation is to be used for an ore-testing plant.

THE Volksraad of the Transvaal has passed two laws that are apt to stir up considerable opposition and may cause trouble if enforced. These are the press law and the expulsion of aliens bill. By the press law it is enacted that in future all articles appearing in Transvaal newspapers must be signed by the writers, and any newspaper can be at once suppressed by the President and Executive Council should they deem it obnoxious to the State: and by the expulsion of aliens bill the President and Executive Council have the power to summarily put over the border any burgher or Uitlander making himself politically obnoxious to the State. It is claimed that both these laws have been passed in defiance of the constitution.

THE cyanide process can be applied with success for the treatment of free-milling ores in which the gold occurs in fine particles, or of tailings and concentrates resulting from wet-crushing and copper-plate amalgamation, or dry-crushing and pan-amalgamation. It can also be used for the treatment of refractory ores in which the gold is so finely divided that even pan amalgamation fails to recover a profitable percentage of values; or of ores in which the gold is coated with a film of metallic oxide or sulphide. All the common ores of silver are soluble in dilute cyanide solution. The rate of dissolution of silver ores is, however, much slower than that of gold. The distinguishing features of the Siemens-Halske process are the use of extremely dilute solutions of cyanide, and electrical precipitation of the gold.

COAL mining is promising to become an important industry in Arizona. In the northeastern part of the territory extensive bodies of bituminous coal are encountered north and east of the Painted desert region. This coal crops out in many places, and at one point has a thickness of 23 feet. The San Carlos coal lands lie east of the Painted desert tract, and extend northeast into Colorado and New Mexico. It comes to the surface in many places, and as far as now known consists of three stratas, the first two having a thickness of four faet while the last and lower one is often found 15 feet in thickness. One thing which has prevented the development of the San Carlos coal measures is the fact that is covered by the Indian reservation, and unless some steps are taken by Congress no work can be done.

THE Mountain Mines, Limited, of Shasta county seems to have entirely overcome all the difficulties of smelting they at first encountered, and are successfully working about 150 tons of ore per day with their big blast furnace and some 200 stall roasters which have lately been erected. All the ore except a small proportion of siliceous ores from other mines for fluxes comes from their own property on Iron mountain. A second blast furnace is being built and it is the present intention of the company to build four or five altogether, and erect 400 or 500 stall roasters altogether. A statement made in the MINING AND SCIENTIFIC PRESS of September 26th as to the proposed number of roasters was questioned at the time as being excessive. There are employed at the mine about 125 men, and at the smelter in operating and construction work about 250.

A PHILADELPHIA paper states that it is reported on good authority that a large company has been organized to promote a system of gold mining without removing the ore from the earth. The scheme as applied to gold mining is to sink shafts a few inches apart and pump into them a suitable dissolvent. A strong electric current is then to be passed through the soil between the shafts. The action of the electric current is claimed to be that it will carry with it the dissolved gold from one shaft to the other and deposit it there on any metallic circuit in the same manner as electro-plating. The successful mining of sulphur in what is called a somewhat similar way in Louisiana is quoted as giving some reason for thinking the gold mining scheme feasible. But the case is very different. In Louisiana the valuable deposits of sulphur are covered with quicksand and many unsuccessful attempts have been made to reach the sulphur. The attempt was made to freeze the quicksand, and for this purpose a giant refrigerating plant was set up, but without success. Then a Cleveland inventor offered the proposition to sink a 4-inch pipe, and inside of this a 2-inch pipe, and to melt the sulphur by forcing down steam under pressure and allowing it to expand at the bottom of the well, and pumping out the molten sulphur through the small 2-inch pipe, as is done in certain salt wells worked on a similar plan. This scheme worked successfully and is now in operation, sulphur 99 per cent pure being obtained, which is allowed to cool in vats and afterward cut into suitable blocks.

The Relation of Geology to the Development of the Mineral Resources of the State.*

By HAROLD W. FAIRBANKS, PH. D.

The science of geology has for its object the study of the earth. It attempts to unravel its history from the earliest times of which we can gain any record, and traces downward to the present the development and modification of its various physical features, as well as the complex life which has gradually grown up on its surface.

On the one side this science is studied more directly for the added knowledge which it gives us of the world processes. On the other side, there is the practical aspect, which deals with the varied needs of the individual and of society. These two—the practical and the purely scientific—are inseparable in many of their applications.

There is needed first the most careful and scientific work along lines which, taken in themselves, do not seem to have any practical bearing in order to develop those results which can be turned to some end which is useful in aiding the onward march of industry.

The science of geology is made possible because of the uniformity in nature's processes. Chemical and physical forces have never ceased their action upon the earth since it was first formed, and it is through a knowledge of these forces going on to-day that we can determine what took place in ages past. The degredation of mountain ranges, the deposition of their material upon the bottom of the ocean in regular order and the growth and modification of life is but the present aspect of an almost infinite series of similar changes.

The regular succession of strata, the younger above the older, and the steady growth of higher and still higher forms of life, as represented by the fossil remains in these strata, are among the most important means by which we are enabled to intelligently unravel the complicated history of our earth.

At first sight it does not seem of any practical use to spend so much time in classifying the rocks and arranging them in their proper sequence by the aid of the animals and plants entombed in them; but study, as well as practical experience, has shown that it has a most important use. Different mineral products are found in different portions of this series of rocks which it is the problem of the geologist to classify according to their age and character; and when we have successfully outlined the structure, character and extent of the different rocks of successive periods, noting the conditions under which they were formed and the disturbances which they have undergone, we are in a position to intelligently direct those searching for valuable minerals, thus saving them time and money.

The Carboniferous period is the one so productive of coal in the Eastern States, but in California the strata of the same age are totally barren, so that it is forever useless to expect to find the best quality of coal in California. A knowledge of this important fact is due to the work of the paleontologist, and has been determined only by the means of a thorough acquaintance with the fossils of the coal periods over the whole world. We ought to appreciate the facts which we apply so easily to-day to the solving of such practical questions which have taken scholars and investigators of the pure science years of research to reach. The organized study of geology has been largely carried on and brought to its practical applications through the instrumentality of geological surveys. These surveys have been undertaken and supported by appropriations from the local governments.

Since geology began to assume the character of a science, surveys have been initiated and carried on by all civilized governments, and to their systematic investigation is due much of the successful effort for the development of the mineral industry. The geological survey has, then, in the first place, for its object the study of the different kinds and groups of the rocky strata exposed in the crust of the globe. It investigates the extent and structure and mineralogical character of each.

The deposition of most minerals is usually the result of volcanic or other violent disturbances of the earth. Thus conditions for their formation have existed at different places in different periods. Each mineral is often associated with certain portions of the country or with certain formations, and it is the business of a geological survey to point out the regions where such and such minerals are liable to be found and by careful study determine the extent and character of those already known.

I do not mean to make light of the debt which we owe to the prospector. Without his patient searching much of our present wealth would have remained hidden in the ground. His work and that of a geological survey are different, and the one can learn from the other. A knowledge of the principles of geology which govern the character of ore deposits would, however, have saved the prospector many a weary search and wasted energy. As a general thing, it may be said that the principles governing the deposition of minerals are dependent for their action in a high degree upon the nature and structure of the country rock.

Since geological surveys were organized fifty years ago they have grown in number and importance, fulfilling a need of our civilization which nothing else has been able to do. In many of the Eastern States the great expansion of the mineral industry is directly traceable to the work of the geological surveys. Geological mapping is being carried on over a large part of the world and will doubtless be continued for generations.

If States like New York, New Jersey and others whose mineral resources are comparatively limited can find it profitable to maintain geological surveys for many years—that of New York continuously for over forty years—it can be readily seen what an enormous advantage it would be for California, whose area, as well as mineral resources, is so much more important.

Although one of the leading States in the Union in wealth and natural resources, California has done comparatively little in systematic survey work. The science of geology has so advanced that to-day it is only careful, detailed work which can in reality be very profitable. We have now a general working knowledge of nearly the whole State as the result of the investigations of different organizations, chief among which is the State Mining Bureau. The latter institution has done some good detailed geological work upon the old river channels and in portions of the chief gold areas, yet circumstances have made it impossible to do more than reconnaissance work over the most of the State.

Although the former survey was discontinued because of the feeling that its work was not satisfactory, yet the need of something of the kind continued to be felt, and the State Mining Bureau was organized in 1880.

It was felt that more definite knowledge was needed of the mineral deposits of California, but it seemed best to devote the energies of the institution more directly to the problem connected with mining. In this line a vast amount of work has been accomplished, which has done much to call attention to the resources of the State and stimulate mining.

California is growing and other needs are coming to the front. The extent and character of the coal and oil fields, the demand for good building stone, knowledge of the water supply, etc., are earnestly calling for systematic attention.

The needs of the mining industry are also expanding, so that it is felt that the work of the Mining Bureau must be restricted more closely to that line and give up all attempts at carrying on geological work in connection with that of mining. The work in geology is important, and it is felt that it ought not to be dropped, but that arrangements should be made to carry it on separately in the form of a geological survey, either under the auspices of the Mining Bureau or in any other way in which it can best accomplish what is needed. It would seem that, however, for the present at least, that it could be more economically administered as a department of the Mining Bureau, whose library, museum and laboratory could be utilized. This question is proposed for your consideration.

Before proceeding farther in regard to the functions of a geological survey, I will indicate briefly some of the principles governing the distribution of the natural economic products in California, so as to give a clearer idea of what a survey might accomplish.

The geologist divides the formations represented upon the surface of the earth into the following great divisions, beginning with the oldest: Archæan, Algonkian, Cambrian, Silurian, Devonian, Carboniferous, Triassic, Jurassic, Cretaceous, Eocene, Neocene, and Quaternary. The earlier formations are not well represented in California as far as we know at the present day, and do not particularly concern us. Down to the close of the Jurassic the land area in California was probably much smaller than at present. Then occurred the great revolution, upturning and metamorphosing the rock constituting the auriferous slate series. Before the deposition of the next series of beds called the Cretaceous California's important gold and silver deposits were formed, extending the whole length of the State. As a result of this fact it is useless to prospect in the Cretaceous for valuable gold veins. This condition of things not being generally known by prospectors, they are constantly hunting for "Old Padre mines" in portions of the Coast Ranges where the rocks exposed were mostly formed after the period of mineralization.

The quicksilver deposits date from comparatively recent times, having been formed after the great volcanic outbursts in the Coast Ranges. While this mineral is largely confined to the Coast Ranges, it occurs in small amounts in the Sierra Nevadas.

The principles governing the formation of ore deposits should be understood by all interested in mining. Many have been the mistakes, and many the failures, from a lack of knowledge or appreciation of important geological principles. It should be the province of a survey to dispel the many erroneous ideas current, to examine new mineral districts, reporting upon their extent and value, and in every way possible spread true conceptions among those vitally interested.

The thorough collection of all the rocks and ores of the various mining districts is not one of the least of the functions of a geological survey. Duplicate collections should be made of all important and typical specimens and a suite maintained in the State Museum, in addition to distributing sets over the State in charge of the high schools, or in some other way, so as to be of the widest educational value. In the leading mining centers of the State these collections would be of very great value. This distribution of typical specimens is being done by some of the States as well as by the general Government. The collections from the latter, however, reach only the universities. These collections could be made while the survey was in progress at a very slight extra expense, and I can conceive of no more direct way of informing people in regard to mineralogy and geology.

When we come to a consideration of the deposits of coal, oil, and the question of water supply, it is easy to be seen that their successful exploitation is most vitally dependent upon a knowledge of the economic geology of California, and more particularly of the Coast Ranges. Such knowledge is more necessary in this State in examining deposits of coal or oil than in most of the Eastern States, owing to the immense amount of disturbance to which the strata have been subjected.

The geological structure is exceedingly important when the question of the extent of a coal seam is under consideration, while a correct determination of the age of the rocks showing traces of oil will settle the question as to whether it is advisable to bore at any particular spot.

Workable beds of coal are confined to three different geological formations in California, and the determination of the areas where it may be found should be attended to first. Then there should be taken up a study of the different fields where it is known to occur and the extent and character of the beds determined.

I wish that I could impress upon you the importance of the fact that a thorough knowledge of the structure of the mountainous portions of the State, where coal or oil are known to occur or are likely to be found, is of the utmost importance.

Many times in my examination of mineral deposits in different parts of California have I come across men who have spent large sums of money and months or even years of toil prospecting coal seams, where a little reliable geological information would have shown them the uselessness of it.

Near Goler I once met a miner who had spent all winter at work prospecting a seam of coal of fair quality and which might have been of value in that region if of sufficient extent. Unfortunately, the miner did not notice that the seam of coal was associated with strata which formed only a remnant a few hundred yards in extent, being completely surrounded by the gold-bearing rocks of much greater age.

At the eastern foot of the Santa Ana mountains in southern California there are remnants of coal beds left by erosion. They occur faulted into the range of older rocks and can never be mined profitably. The condition of their occurrence has never been noted by the men who have spent much time and money there.

South of Carmello bay, in Monterey county, there is a coal field, which, although the seam is thick enough to pay well, has only a very limited extent, being surrounded by granitic rocks. Through ignorance of the simple geological principles involved, many thousands of dollars have been spent on roads and tramways and in opening the property. These things are not apparent to the miner who has had no opportunity for acquiring the proper knowledge, and it sometimes happens that even experts, who are supposed to know, have blundered because of their non-familiarity with the local geological conditions.

California needs coal more than anything else, and the question arises as to whether she really possesses beds of much value. While the general impression is that the home supply is limited, we occasionally see descriptions of discoveries which are to revolutionize manufacturing. Notwithstanding the numerous descriptions of the coal beds of California, we know comparatively little in a definite way as regards their actual or prospective value. This question can only be determined by a systematic survey carried on by men who are especially trained in the study of geological structure and of the conditions obtaining in California.

What has been said with reference to coal applies with equal force to the question of the oil supply of California. At the cost of much experimentation and many failures, the oil industry has reached a considerable development, but it could be greatly encouraged by a systematic survey of the whole of the Coast ranges. In this line the State Mining Bureau has recently made a good beginning.

The oil deposits of California are peculiar in many respects, occurring as they do in a very recent geological formation, having no relation to the coal beds.

Eastern experts come here and, ignorant in most

*Read before the California Miners' Convention, Nov. 11th.

cases of the geological conditions under which the oil is found, lead people into spending thousands of dollars foolishly. They neglect entirely the geology of the region where they propose to bore and put down wells merely on the surface indications of oil as shown by seepage. Thousands of dollars have been thrown away the past year in the vicinity of San Diego and in earlier years in the counties farther north, when if a competent geologist had been called in, the efforts would have been discouraged. These borings have sometimes been put down in the proper oil horizon, but no account has been taken of the structure. At other times they have been made in strata which are older and underlie the oil rocks, and, as a result, the deeper the borings go the less prospect of getting oil.

A large number of cases of this kind have come under my observation, and it shows how much the work of a thorough geological survey is needed. There are large areas of the State which are liable to contain oil in paying quantities, and it is important that their study be continued until all are surveyed.

The question of artesian and general underground water supply is an important one in many portions of the State. The available supply, as you know, is dependent in large measure on geologic structure. Practical experimentation will often be successful, but it also involves many failures. It is much simplified if we understand the character and position of the strata.

Building stone is destined to be in much greater demand in the future than it has been in the past, and the question of a supply of good stone of various kinds and within the limits of transportation is becoming more pressing every day. Its importance is shown by the difficulty encountered in selecting suitable material almost every time that a large structure is in contemplation. There is no doubt that stone exists in abundance and of good quality, but the fact must be demonstrated and brought before the public.

Mineral springs abound through the State and are the source of a considerable industry. Their investigation and description would come within the scope of a geological survey, and though it would take time to accomplish, yet the result would be invaluable.

I have enumerated the above as constituting some of the more important lines of research of a survey. There are many others, but they will not be taken up here.

You are all undoubtedly aware of the extensive mapping which the United States Geological Survey has been carrying on for a number of years in the northern and eastern parts of the State. This work is excellent, and I fear that some of you may think that it is not only unnecessary but foolish for the State to undertake to compete with it. As a matter of fact, however, there are large areas which the Government has no intention of examining geologically, and besides the functions of the two organizations are so different that there need be no conflict. There are also a number of good reasons why the State should not be deterred from undertaking a geological survey because of the work of the general Government.

In the first place the maps and reports of the United States Geological Survey are not within as easy reach of those who really need them as the results of the State work would be, and while very valuable, appeal more to the technical man and scientist. The State reports are disseminated among the people as those of the Government can never be.

The collections made by a survey are among the most important means for the education of the masses, but in the case of the United States Geological Survey these are all taken to Washington, where they are practically inaccessible to those who ought to see them. The minerals, rocks and fossils should be thoroughly represented in the State museum so that the character of every county and every mineral district can be readily seen.

Mr. Walcott, the director of the United States Geological Survey, has expressed the intention of confining the work of the survey to special problems. No general mapping will be undertaken by that organization, so that if the State does not take up any geological work the most of its area will not be touched and many important regions and industries will remain almost unknown.

There would be no advantage in the State attempting to remap the area already covered by the Government surveys, unless for the purpose of elucidating some particular economic problem, but, while examining mineral deposits and making collections from all parts for local benefit, should confine its mapping to those regions not included within the former surveys. There are many problems lying more in the domain of economic geology which the State can take up to very much better advantage and with greater profit than can the United States Geological Survey. In fact, many of these have hardly been touched upon by that survey.

Mr. Walcott will be glad to leave to the State investigation all along those lines which it is willing to take up, and there is no need of the surveys conflicting in any way. The lines of research of the two organizations would to a certain extent be different. Plans of work and co-operation can certainly be agreed upon to the benefit of both. The work of the United States Geological Survey is excellent as far as it goes, as those of you know who have examined the maps they are making at present, but it would be decidedly unfortunate if it should result in the State making no effort of its own. As you know, the reports of that survey do not circulate among the people as those of the State do, and they would remain as ignorant as before upon those questions concerning which they need information. There is also a loss of State pride and individuality.

As citizens of a State possessing exceedingly varied and valuable mineral resources our local pride should lead us to maintain a rank with other States, and to support a center of science and economic investigation.

There is one line of work associated with a geological survey, and on which its success depends, which the State can profitably undertake in conjunction with the general Government. This is in the production of accurate maps, on which the topography is indicated by contour lines. The United States Geological Survey has been empowered to undertake topographic mapping in the different States where it is asked for by the latter, the expense to be divided equally between the State and the general Government. I have the word of Mr. Walcott that such an arrangement can be entered into in California. The State will have the privilege of printing all the maps it needs from the plates which are prepared by the general Government, and at no extra expense. Those of you who have seen the maps issued from Washington, and covering much of the gold belt, know how valuable they are.

Small areas have been mapped topographically in the Coast Ranges and in the southern part of the State, but it is not the intention of the Government to extend these greatly unless the State will step in. When the great importance of these maps becomes generally known the work will undoubtedly receive such support as to insure its completion over the whole of California. We have all had experience with the poor maps now in existence. There is so little accuracy in some of the county maps that for many purposes they are of little value.

These topographic maps form the only basis for an accurate geological survey, but in addition they are of the utmost value to the surveyor and engineer. While all the natural as well as artificial features are indicated on these maps, the contour lines indicating different elevations enable the most unskilled person to trace out the course which a road or ditch would have to follow without expensive surveys.

I would respectfully suggest that the recommendation of the State Mineralogist concerning the mining and geological work be taken under advisement by a committee who should be entrusted with power to make recommendations for the necessary enactments during the coming session of the Legislature.

The survey might perhaps be organized to the best advantage as a department of the State Mining Bureau. In this case the expense would be less and it could occupy rooms in a portion of the same building and have the benefit of the museum and laboratory. It should be empowered to undertake topographic mapping in conjunction with the United States Geological Survey. Then, as the funds might permit, there should be undertaken the plotting of the different formations, with reports describing the extent and charater of their various mineral contents. During this work collections of rocks and minerals should be made for the State museum and for exchange.

There has been carried on in former years, partly under Prof. Whitney and partly under the auspices of the State Mining Bureau, a large amount of reconnaissance work, so that we have now a general idea of nearly the whole State. As a result of this fact we should not have to lose any time, but could get down to productive work immediately. We are in a position now to do thorough and valuable work as a result of this general knowledge.

The large preliminary geological and mineralogical map which the State Mining Bureau issued six years ago is now, owing to the rapid strides which our knowledge has made, entirely antiquated. It is known now to be sadly inaccurate in regard to the rock formations shown, as well as in regard to the occurrence of minerals. We should not delay entering upon a correction of this map, if we would have the reputation of the State along scientific and industrial lines maintained.

If we had to begin with a very modest appropriation, I believe the work would meet with such favor as to ensure its continuance and expansion. California is a very large State, and, of course, to do any really valuable and permanent field work, only small areas could be covered each year. A part of the moneys might be devoted to the mapping of important localities and a part to more general problems connected with the distribution of minerals over the State as a whole. California contains as intelligent a class of people as any State in the Union and will, I believe, appreciate the results of a survey carried on in a thorough manner. Geology is becoming more accurate in its methods every year, and a geological survey at the present day cannot help but return many times its running expenses to the State each year.

Laboratory Tests in Connection with the Extraction of Gold from Ores by the Cyanide Process.*

NUMBER III.

By H. VAN F. FURMAN, Denver, Colo.

Total Acidity.—The sum of the tests shown gives the total acidity, but as this is frequently all that is required, it may be determined as follows: Introduce 10 grammes of the pulp into a stoppered bottle with some water; add a measured excess of the caustic soda solution; agitate for twenty minutes, and then titrate back with deci-normal acid solution.

The soluble acidity is due to salts with an acid reaction, such as ferrous sulphate, zinc sulphate, copper sulphate, etc., or to free sulphuric acid from the decomposition of pyrites, tellurous acid, etc. It may be overcome by giving the ore a preliminary wash with water. This washing is followed by treatment with a weak solution of caustic soda or caustic lime, which neutralizes the latent acidity due to basic salts. The amount of alkali necessary is determined from the quantity of deci-normal soda solution used in the above experiments. Unless the ore contains a large amount of free acid, the preliminary washing with water may be omitted, the total acidity being determined and reported in terms of lime. Sufficient lime is then added to the ore, before crushing, so that it becomes thoroughly incorporated before the ore reaches the tanks, and when the tank is charged the cyanide solution is at once admitted.

II.—TEST FOR THE CONSUMPTION OF CYANIDE.

The original strength of the stock solution being known, it is only necessary to determine its strength after it has been used on a lot of ore to arrive at the consumption.

Introduce 20 grammes of ore (treated with a sufficient quantity of soda or lime, if necessary,) into a glass-stoppered bottle; add 40 c.c. of the cyanide solution, and agitate for twenty minutes; filter; measure off 20 c.c. of the filtrate and determine the amount of undecomposed potassium cyanide remaining in the solution according to Test 6. The difference between the amount of potassium cyanide in 20 c.c. of the stock solution and the quantity found above gives the amount consumed by 10 grammes of ore.

If the consumption of cyanide is not excessive (which will depend altogether on the value of the ore, as rich ores can stand a much higher consumption than those of lower grade), or, say, not over 4 pounds of potassium cyanide per ton of ore, the following extraction tests can be proceeded with.

III.—TESTS FOR THE PERCENTAGE OF EXTRACTION.

Generally two series of tests are made: by agitation and by percolation.

Agitation.—Take four 4-ounce, wide-mouthed, glass-stoppered bottles, place 1 assay ton of pulp in each, then add to each 60 c.c. of solution of the following strength respectively:

To No. 1	0.1	per cent	KCN.
" 2	0.3	"	"
" 3	0.5	"	"
" 4	0.75	"	"

Before adding the cyanide solution the proper quantity of neutralizer, as determined by Test 1, is added. Allow the bottles to stand for forty-eight hours, with occasional shaking. Filter off solutions; wash with water up to original bulk; test an aliquot portion of the solution for loss of cyanide; dry the tailings; crush them to 100-mesh, and assay. From the assay of the original pulp and the assay of tailings the percentage of extraction can be calculated.

Another method, preferred by some, is to assay the tailings and also assay the solution (see Test 11); then

$$\text{Percentage of Extraction} = \frac{\text{Assay of Solution} \times 100}{\text{Assay of Solution} + \text{Assay of Tailings.}}$$

For quick results the bottles are placed in an agitator, which is revolved for twenty-four hours.

Several agitation tests can be carried out in this manner, varying the quantity of cyanide solution used and the mesh of ore (10, 20, 30 and 40 mesh).

Percolation.—For these tests a glass percolating jar provided with a false bottom covered with a double filter paper will be found convenient. Place 1 pound, or more, of the pulp (with the proper quantity of the neutralizer thoroughly mixed with it) on the filter, and add to the charge 230 c.c. of the stock solution for each pound of ore taken. Allow the solution to macerate for twelve hours, and then percolate gently for thirty to forty hours. Wash with water until the filtrate reaches the original bulk. The rate of percolation may be noted here.

Test the solution for loss of cyanide; assay an aliquot portion of the solution and the tailings, and thus determine the percentage of extraction.

A series of tests may be carried out in this manner, varying the strength of the cyanide solution, the fineness of the ore, and the time of contact from twelve to seventy-two hours.

(*To be Continued.*)

Dredging versus Impounding Debris.

TO THE EDITOR:—Although not a delegate to the State Miners' Convention, I am just as much interested in its proceedings. In one of the daily papers of to-day's issue is an interview with Gen. Tolman of El Dorado county, in which he says: "The way to settle the hydraulic mining proposition is to allow every man to mine as he formerly did and let the slickens go to the river as before, and assess the hydraulic miners so much per cubic yard to pay for the operation of dredgers and sand pumps to keep the river free, and to charge so much to the owners of swamp lands for reclaiming them, etc."

Gen. Tolman's idea is very good, as far as it goes; but it seems to me that the Federal Government should bear some of the expense of keeping the rivers open in connection with the miners, and no doubt it would, and this State, also, for it has already made a generous appropriation for the purpose of building restraining dams.

Your correspondent has had considerable experience in hydraulic mining, brush dams, elevators and the care and disposition of debris in general, both in this State and in foreign countries, and does not hesitate to say that the dredging proposition is the only true solution of the disposition of tailings coming into our navigable rivers. I advanced this idea to some officers of the Anti-Debris Association a few years ago and it met with no objections at that time.

Most hydraulic miners know that the Caminetti law is of benefit to a mine only when the conditions are favorable, and not all gravel mines, by any means, are so situated as to be able to impound their tailings economically; but all mines would be able to operate as before if the dredging methods were adopted; and the expense of dredging, pumping, etc., being borne by all, would be brought down to a minimum for each.

I do not think it is fair to make "fish of one and flesh of another." Therefore, the drift and quartz mine owners, and, in fact, everyone else who dumps a cubic yard of earth into the navigable rivers and their tributaries, should be made to pay for that cubic yard. The hydraulic miners should not be made to bear all the expense.

Brush dams are good as long as they last, but sooner or later they will wear out, if there is any water at all, and the friction between miner and farmer will break out afresh. Again, there are very few brush dams in the State sufficient to restrain all the estimated pay gravel above them. There is a limit to which the height of dams can be built with economy, and then mining must cease, with perhaps only half the mine worked out. It is a rich mine, indeed, that can afford to construct a dam with masonry, and a great many mines are situated far from both rock and brush suitable for dams. No serious complaint has been made about boulders or coarse material in our rivers. It is sand, and there are dredgers that handle several thousand cubic yards of sand per hour. With waste tule lands for a dumping ground, we would soon have far better lands for agricultural purposes than the miners are washing away, and if everyone who is interested would pay his just share of the expenses, I believe it would be the cheapest way to dispose of the tailings. It would benefit the rivers, the miners, the farmers, the merchants—the whole State—and would be of incalculable value all round. At least, I think the project is worth serious consideration. H. P. GORDON.

1109 East 21st street, Oakland.

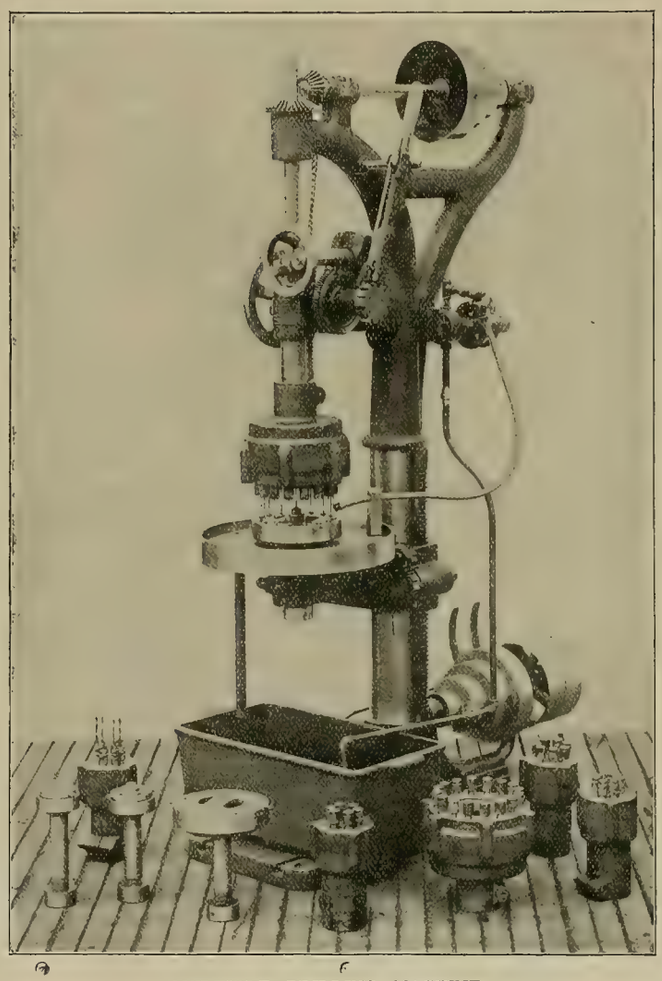
It Does Not Pay.

Don't overwork. As business requires a clear intellect and good judgment to make it a success, these requirements are not likely to be met by those who attempt to master them with fatigued and tired-out brains. Therefore, it follows that the need for recreation is imperative. It may be but a change of thought brought about by the perusal of an interesting book, but nevertheless it serves the purpose well. This thinking business, talking business, eating and sleeping with business will be mighty apt to bring about the loss of life and business, as the human brain is not made of elastic that never gets stringy, nor is the human form made of such material as to be able to resist whatever inroads may be made upon it. A man whose nerves are strung up to their highest tension is not capable of studying the best interests or giving the best service. Little things that would otherwise not be noticed prove an irritant.

Mechanical Progress.

Multiple Drilling Attachment.

The illustration on this page is from a photograph of a multiple drilling attachment designed by the Davis & Egan Machine Tool Co. of Cincinnati, O., for the rapid production of work requiring a definite number of holes to be drilled and accurately spaced at the same time. As will be seen, various heads are furnished to suit the number of holes to be drilled.



MULTIPLE DRILLING MACHINE.

The machine is a modification of the makers' upright drills, in which the drill spindle is used as a driver for the drills, which are placed in a head attached to the lower end. The work is clamped in a jig, shown in the table, and the drills before touching the work pass through stud guide bushes, which insure accuracy. A special pump is provided to lubricate the drills and the surplus is caught by the rim around the table and returned to the pan beneath.

This attachment can be applied to heavy upright drills or to radial drills for drilling holes up to 2 or 3 inches in diameter. The machine is self-contained, is accurately fitted and sure of continued alignment.

Shotgun Barrels.

Why shotguns should be so expensive compared with rifles is a question often asked. It is on account of the expense of making the barrels. The United States Consul at Liege, Belgium, describes the manufacture of the barrels made there as follows:

"The steel is imported from Westphalia; the iron is manufactured at Couvin. The factories receive their motive power from the River Vesdre. The ingot for the production of the curled damascus, which is the favorite design for fine guns, is composed of about thirty sheets of iron and steel, each having the thickness of 4 millimeters and a breadth of 120 millimeters, which form a square mass about 50 centimeters long, and are enveloped in a box of common thin sheet iron or by small wires at each end. The package thus prepared is put into a furnace and welded together at the lowest possible temperature. Too great a heat destroys the metal and yields a burned damascus, showing a small, if any, design. Each barrel receives 150 welding heats while being forged. If one of these welding heats is unsuccessful, the barrel may be a failure, either by the alteration of the damascene appearance or by a trace of the smallest imperfection in welding. Swedish iron is not used in forming curled damascus—only refined iron of Belgium, which gives a greater contrasting hue to the steel, and can be welded at a lower heat. After the ingot is welded it is rolled into small square rods of 7 to 9 millimeters, according to the design of the damascus desired.

"The rods are then drawn into ribbons by the smiths. The manipulation of these ribbons at high temperature is such that, in a length of one meter, 200 twists are shown. The twisting increases in pitch toward the thinner part of the barrel, which is first formed by winding the ribbons on a mandrel, and welding the coils together at the edges. The barrels are then bored out, straightened, ground to the proper thickness and polished. The joining of the barrels for double-barreled guns is a process requiring great care, as the value of the gun largely depends upon the accuracy with which this part of the process is executed. Each barrel is proved by a shooting test at the manufactory before it is placed on sale. It is said that the annual production of these barrels is 300,000, and that they are exported chiefly to England and the United States."

Compressed Air on a Warship.

The new United States monitor Terror is the only vessel in the navies of the world in which pneumatic power is applied for turning the turrets, working the guns, steering the ship, etc. The other monitors have hydraulic machinery for their turrets and guns, and are steered by steam. The Terror is therefore a practical experiment, whose success may lead to far wider use of the pneumatic principle.

The Terror has two engines for compressing the air—one situated in the hold near the forward turret and the other on the berth deck near the after turret. Either of these, singly, can supply sufficient air, at a pressure of 125 feet per square inch, to operate both turrets, including the guns—a total weight of nearly 500 tons. The compressor takes its supply of air from the chamber in which the engine stands, and compresses it in two cylinders, sending it also through two condensing cylinders, where it is cooled by circulating sea water.

Scientific Progress.

Pneumatic Tubes in the Postal Service.

The Postmaster General's report of the railway mail service for the last fiscal year shows that the expenditures for mail transportation, inland and foreign, was $46,523,932, an increase of over $1,500,000 over the previous year. Mail service to the gold regions of Alaska has been established for the benefit of miners and others there. The pneumatic tube service, which it was desired to establish in Philadelphia, New York and Boston, has not been developed as rapidly as it was hoped, on account of the enormous expense. The permission of the bridge company has been obtained for the construction of a tube between the New York and Brooklyn postoffices, crossing the Brooklyn bridge. The Boston matter is practically settled, as far as the permission of the city council and other interested parties is concerned, and only awaits the signature of the Mayor. It is also hoped that a much greater pneumatic tube service is within the near reach of the department in New York city. The postal service of the United States is far behind that of the leading countries of the old world. This is mainly due to the large extent of territory that is covered, from much of which very little revenue comes in proportion to the outlay. In London and other large cities for many years the pneumatic tube has been in use and has had much to do with the making of the postal system there a marvel to visiting Americans. Generally speaking, a letter may be dropped in one part of London addressed to a point four or five miles away and it will be delivered sooner than a special messenger could cover the distance.

Making Diamonds.

M. Henri Moissan, the French scientist, whose experiments with higher temperatures have been productive of results important to science, delivered a lecture in New York lately, which he illustrated with some brilliant experiments. One of these was the making of a diamond. The surface surroundings among which diamonds are found in nature indicated to him that to force carbon into crystalline form, not only

heat, but great pressure have been necessary. So he reproduced the conditions by fusing iron and carbon together in his devastating furnace and then cooling the mass suddenly; the change in volume of the iron produced the intense pressure required and the diamond was formed—a microscopic diamond, but still a diamond.

Tricks of Ancient Gold Workers.

There is a papyrus which gives recipes for various alloys used in the manufacture of cups and vases, for making gold and silver ink, for gilding and silvering, and for testing the purity of precious metals. Other recipes teach the method of falsifying them by adding baser metals—an operation called diplosis, or doubling, for the mass of gold or silver was doubled, while the color remained unchanged, and as the compiler of the material remarks, a skilled workman would find it difficult, or even impossible, to detect the fraud. The recipes which recur most frequently describe various modes of preparing asem, a word which originally meant a natural alloy of gold and silver known to the Greeks as electron. It was at first looked upon as a distinct metal, was considered sacred to Jupiter, and was designated by the sign of that planet, but at a later period the name was applied to all alloys, and M. Berthelot remarks that in this fact seems to lie the explanation of the origin of alchemy. Both gold and silver could be extracted from genuine asem, and it seemed as though it could be changed at will of the operator into either one or the other; it could also be made artificially by mingling gold and silver, or closely imitated by some of the numerous alloys, eleven or twelve varieties of which are described in the papyrus of Leyden.

PRESIDENT CLEVELAND will this month formally open at Philadelphia the most remarkable institution of its kind in existence—a museum which is designed to contain an assemblage of the natural and manufactured products of all countries of the world. Its object is to stimulate commerce and boom American trade, particularly with South America and Africa. All parts of the United States are interested in the enterprise, to which contributions have been made in one shape or another by cities north, south, east and west. The idea is that anybody who has anything to sell shall be enabled to find out offhand just where and how it is wanted, and the best way to seek the purchasers anywhere on the globe.

To convert Fahrenheit into centigrade degrees the usual custom is to subtract 32 from the reading and then institute the proportion 9 to 5. But the French journal *L'Industrie Electrique* gives a simpler rule as follows: Subtract 32 degrees and divide by 2; then add to this $\frac{1}{10}$ of itself and if further accuracy is desired $\frac{1}{100}$ more. For instance, if it is required to find the number of centigrade degrees corresponding to 72 degrees Fahrenheit, subtract 32 and divide by 2, giving 20; adding $\frac{1}{10}$ more gives 22, and for greater accuracy another $\frac{1}{100}$ gives 22.2. The method is not as simple when applied to the reverse calculation.

Electrical Progress.

Niagara on Tap.

In the journal of the Franklin Institute, T. Commerford Martin, in an article on Niagara and electricity, says of long-distance transmission:

"As to the far-away places, Prof. Houston and Dr. Kennelly have made a careful estimate of the distance to which the energy of Niagara could be economically transmitted by electricity. Taking established conditions, and prices that are asked to-day for apparatus, they showed that even in Albany or anywhere else in the same radius—330 miles from the Falls—the converted energy of the great cataract could be delivered cheaper than steam power. What this enterprise at Niagara aims to do is not to monopolize the power, but to distribute it, and in this way it makes Niagara, more than it ever was before, the common property of the citizens. With both the Canadian and the American plants fully developed, no less than 350,000 horse power will be available, while the stationary engines now in use in New York State represent only 500,000 horse power. Yet the 350,000 horse power is but one-twentieth of the 7,000,000 horse power which Professor Unwin has estimated the Falls to represent theoretically. If the 350,000 horse power were estimated at $20 per year per horse power, and at Niagara should replace the same amount of steam power at $50, the annual saving for power in the State would be more than $10,000,000 per year."

New York and Brooklyn Tunnel.

A corporation has been formed to construct a tunnel to join the cities of New York and Brooklyn to be lighted by electricity, and to contain proper heating and ventilating conveniences. By this scheme from 60,000 to 70,000 passengers can be transported in an hour, and be connected with the various trolley or cable lines at either terminus.

The general plan of the tunnel is to have two tracks in two tunnel tubes, thus making it a four-track scheme. These tubes will be 8,700 feet long, and the dimensions of the two tunnels together will be 45 feet wide. The height all the way through will be 28 feet, and the grade at either end will not be more than 4 per cent. The tunnel will come to the surface at both terminals, so that all cars that converge at the points mentioned will be able to make easy connection with car lines in either city. With the exception of 60 feet in the middle of the river, the road-bed is composed of rock, and will make the plan more feasible than the Hudson river tunnel. Two great shafts will be put down close to the river on its opposite sides, to the tunnel depth, and from these four "breasts" can be simultaneously worked. All the material excavated and raised through these shafts will be carried away by barges on the river. Should it be found necessary to expedite matters by excavating also from the termini of the tunnel, little inconvenience, if any, will be caused to the public, as all the work will be on the company's own land, purchased for terminal purposes. The openings near the river will be, upon completion of the work, converted into ventilating shafts. For the avoidance of the possibility of even fictitious damage claims, the company proposes to procure right of way by purchase wherever the line passes under private property. The cost of this is estimated at $3,500,000. The cost of the Brooklyn bridge was $15,000,000, yet the tunnel proposes to afford more rapid transportation for the total sum of $6,000,000.

A VERY suggestive sight is the long line of steam locomotives which the passenger on the Lake street elevated road in Chicago sees rusting on a siding as he glides past them behind a noiseless, smokeless, sparkless, smelless electric motor. Here, at least, the steam engine has had its day. The discarded machines, thirty or so in number, modern and perfect of their kind, served their brief term well, and are as capable of service now as ever. It was through no fault as steam locomotives that they were dismissed from service into inglorious idleness, but because a better and more economical power in the form of electricity has been discovered. The proof of its superiority must have been conclusive, for the owners of this hitherto unprofitable road, newly and amply equipped as it was for steam service, have borrowed and expended nearly $300,000 in equipping the eight-mile line for electricity. Indeed, the advantages of electric power for light, short-line passenger service have been demonstrated, and the only question now seems to be when this power will be adopted for all train service in cities.—Railway Age.

Practical Information.

Cost of Labor Wars.

While it is true that an industry must prosper or decline as a whole, and that all engaged in the industry must share in the results, it is also true that there must be disputes relative to the exact share for the division between the parties interested.

The tenth annual report of the United States Labor Commissioner makes a detailed report on the subject of "Strikes and Lockouts." The report gives the statistics covering a period of thirteen and a half years from 1881 to June 30, 1894. During that time there is a record of 14,389 strikes in 69,166 establishments, involving 3,714,231 employes, which, with lockouts in 6067 establishments involving 449,927 employes, makes a total of 20,456 disturbances, involving 4,164,158 employes.

The amount lost to the employes in wages by these strikes was $163,807,657, while labor organizations and others contributed $10,914,406, making a total loss to labor of $174,722,663. The lockouts involved a loss in wages of $26,685,516, with assistance rendered of $2,524,298, making a total loss of $29,200,814. Combined, the average loss was $2532 for each establishment, of $47 for each person, making the total of $190,493,173 in all.

An estimate of the loss to employers is given with a total of $82,589,786 in strikes and $12,235,451 in lockouts, making $94,825,237. As only about 45 per cent of the strikes were successful, more than half this vast sum was a positive loss to labor, and the whole may be considered as lost beyond recovery to the industries involved. All this only goes to show the supreme folly of arraying interests against each other that should be combined. There are, no doubt, some cases where an actual strike is the only way to test the matter of wages, but such cases are rare indeed, and with an intelligent understanding of the situation this extreme resort is seldom necessary. There are always limits beyond which no employer can go in paying wages, and these limits are determined at the prices at which the products are sold. Labor leaders are, as a rule, too eager to promote strikes without regard to considerations or consequences, and they encourage the idea that employers can always pay any amount that is asked. What is needed is more intelligence and a better understanding of the conditions, as well as the mutual relations, of the interests involved. Disputes can then be settled without resort to such costly and destructive methods

The President's Term of Office.

After every election of President an agitation is started for lengthening the term of office of the nation's chief magistrate, for the reason that a presidential campaign is distracting and depressing to business. This is always true of a presidential contest, but the interference with industry has been particularly marked in the campaign just closed. The usual uncertainty attending the outcome of a national election is sufficient to cause men of capital to hesitate before putting their money into new enterprises or enlarging existing ones. The disturbance to business has been unusually severe during the last summer, because the issue involved was one of tremendous importance to business interests. But the difference between this and other campaigns is simply one of degree. With every recurring presidential election business must suffer more or less.

These contests follow each other too closely. If elections took place less frequently business would be subject to fewer disturbances from this cause. Six years is not too long a term for the President of the United States to serve, especially if it be understood that he shall retire at the end of that time and not seek a re-election to the office. A six-year term would give two presidential elections in twelve years, instead of three, as now. A four-year term is too short. In the early days of the republic the objections were not so great to the shorter term. Now the very cost of presidential campaigns is an argument against having them more frequently than is necessary to enable the Government to keep in touch with the people.

In order to change the term of the President it would be necessary to amend the constitution of the United States, something which it is very difficult to accomplish. But the change is a very desirable one, especially for the business interests of the country, and it is to be hoped that before many years it may be brought about.

The Government's Coast Defense Guns.

Secretary Lamont will ask for $52,975,368 of appropriations for the War Department for the fiscal year beginning July 1, 1897. By that time the Government will have completed coast defenses armed with thirteen 12-inch, thirty-seven 10-inch, eight 8-inch and four rapid fire guns and eighty 12-inch mortars. The extreme range of an 8-inch gun is nine and one-half miles; of a 10-inch gun, eleven and one-half miles, and of a 12-inch gun, thirteen miles. The 12-inch breech-loading mortar fires a projectile weighing 1000 pounds and attains a range of five miles for the cast iron mortar and of six miles for the all-steel mortar. Four out of five shots fired from an 8-inch gun at a range of one mile struck within a rectangle of 20 inches by 21 inches. Of eight shots fired at a range of 3000 yards, six struck within an area of 18 inches by 48 inches.

The 12-inch breech-loading mortar was fired at a range of 2464 yards at a target which represented the deck of the cruiser Philadelphia, lying broadside on, across which, at right angles, was the deck of the same ship lying bow on. In the broadside target there were five hits in five shots; in the bow on target there were three hits in five shots. All the shots struck within a rectangle of 8 yards by 27 yards.

There are now completed sixty-one 8-inch, fifty-six 10-inch, twenty-one 12-inch guns and eighty 12-inch mortars, and in progress of construction twenty-seven 8-inch, fifty-six 10-inch, fifty 12-inch guns and sixty-six 12-inch mortars.

THE district of Archangel, Russia, has a timber area of about 88,000,000 acres, all belonging to the Russian crown, and the revenue therefrom exceeds that from any other government of Russia. Sales by auction take place annually from a minimum price fixed each year. In 1895 the logs sold for about $500,000. There are nineteen large sawmill plants contributory to the White Sea ports. The growth of the lumber business in this section during the last ten years shows considerable progress. In 1886, 1535 men were employed in the mills, with an output valued at $1,300,000. In 1895, 4558 men were employed in the mills, with an output of over $3,000,000.

THE first notice of the barrel found in ancient literature occurs in the works of Pliny, in the first century of the Christian era. When he made his first trip into the Alps, he found the natives using casks and barrels. It must have been a new thing to Pliny, for he noticed it as a novelty. The Romans learned the coopers' art from the inhabitants of the Alps. They must have been quite skillful, these rude mountaineers, for they made barrels that were tight enough to hold liquids. The Romans improved upon the art.

To restore burned steel tools to their former usefulness they should be heated to a bright red and then allowed to cool off in a mixture composed as follows: Melt 500 parts of tallow and 120 parts of black pitch together and add gradually, under continuous stirring, 375 parts of pulverized sal ammoniac, 125 parts of ferrocyanide of potash, 20 parts of soft soap and a handful of common salt. In the case of larger tools, heating and dipping should be repeated.

Professional Cards.

HERBERT LANG,
Mining and Smelting Engineer,
Albany Hotel, Oakland, Cal.

WADE & WADE,
Analytical Chemists and Assayers.
109½ Commercial St., Los Angeles, Cal.

D. B. HUNTLEY,
Mining Engineer and Metallurgist,
De Lamar, Owyhee Co., Idaho.

ALMARIN B. PAUL, M. E.,
ROOM 49, CROCKER BUILDING.
Cor. Market and Montgomery Sts., San Francisco.
Will act as AGENT for the sale of RELIABLE Mining Property. Principals desiring valuable quartz or gravel investments at reasonable prices will do well to see what I may have. Only legitimate mining properties handled.

W. J. ADAMS, E. M.,
PRACTICAL MINING ENGINEER.
Graduate of Columbia School of Mines. Expert on general mill work and amalgamation. Eighteen years' experience. Will report on Mines and Mills, and take full charge of Mining Properties. Address, 132 Market St., Room 15, San Francisco, Cal.

COBB & HESSELMEYER,
MECHANICAL ENGINEERS.
GENERAL MACHINERY.
HYDRAULICS, POWER, TESTS, ETC.
421 Market St., Cor. First St.,
Rooms 70 and 71.....San Francisco, Cal.

The Evans Assay Office.
W. N. JEHU, - - - - Proprietor.
Successor to Jehu & Ogden.
628 Montgomery Street, San Francisco.
Rooms 46 and 47 Montgomery Block.
Ore Assays, Analyses of Minerals, Metals and their Alloys, Etc.
LESSONS GIVEN IN ASSAYING.

School of Practical, Civil, Mechanical,
Electrical and Mining Engineering.
Surveying, Architecture, Drawing and Assaying.
723 Market St., San Francisco, Cal.
OPEN ALL YEAR.
A. VAN DER NAILLEN, President.
Assaying of Ores, $25; Bullion and Chlorination Assay, $25; Blowpipe Assay, $10. Full Course of Assaying, $50. Established 1864.
☞ Send for Circular.

F. H. HARVEY. W. S. HUTCHINSON.
HARVEY & HUTCHINSON,
GALT, CAL.,
Mining and Metallurgical Work in All Branches.
Assays, Chemical Analysis of Ores and experiments on rebellious ores for treatment by cyanide or other processes. Surveys and reports upon mining properties.

EDWARD C. BROADWELL,
Chemical Assayer.
2006 Champa St., Box 840, Denver, Colo.
Chemical assayer; no loss by fire test; truth only; gold, 75c; gold and silver, $1; gold, silver and platinum, $1.85; copper, lead, nickel, zinc, etc., according to difficulty of precise determination; tests for chlorination, cyanide or proper method of treatment.

Eveleth, MacLymont & Co.
MINING and CONSULTING
Engineers and Metallurgists.
Examine and report on mines, ore bodies, and all metallurgical processes connected therewith.
Practical mill tests, assays and analyses of ores and general analytical work undertaken at the
CALIFORNIA METALLURGICAL WORKS,
10 Annie St. (opposite Palace Hotel),
Between Market and Mission Sts.,
SAN FRANCISCO, CAL.
References to leading mining men on application.

CHARLES P. GRIMWOOD,
Mining Engineer and Metallurgist,
Laboratory, 214 Pine St., San Francisco.

HENRY E. HIGHTON,
ATTORNEY and COUNSELLOR,
Rooms 36-39,
Fourth Floor.....Mills Building,
SAN FRANCISCO, CAL.
Established Thirty-Eight Years. Special Attention Paid to Mining Business.

PROFESSOR GEORGE DAVIDSON,
Late of U. S. Coast and Geodetic Survey.
Consulting Civil and Hydraulic Engineer.
GEORGE F. DAVIDSON.
Agent for Sale of Mines.
530 California Street, San Francisco, Cal.

Thomas B. Everett, M. E.
Twenty-six years practical experience in metal mining. Will make reports upon property, or furnish properties to purchasers, if desirous to invest in the Cripple Creek gold district, all on short notice.
References furnished in Denver or San Francisco. Branch office, Room 25, tenth floor, Mills Building, San Francisco, care S. K. Thornton, or THOMAS B. EVERETT, Box 195, Denver, Colo. Registered cable, Everett, Denver.

LOUIS FALKENAU,
STATE ASSAY OFFICE,
434 California St., near Montgomery.
Analysis of Ores, Metals, Soils, Waters, Industrial Products, Foods, Medicines, etc., etc.
Court Experting in all branches of Chemical Technology. Working Tests of Ores and Investigation of Metallurgical and Manufacturing Processes. Consultations on all questions of applied chemistry. Instructions given in assaying and all branches of chemistry.

W. B. TAYLOR. H. C. WARD.
C. A. LUCKHARDT & CO.,
Nevada Metallurgical Works.
ASSAYING, MILLING AND ANALYSIS OF ORES.
71 & 73 Stevenson St., San Francisco, Cal.

EDWARD L. HALLAWELL,
115 and 117 Main Street (2nd floor),
SAN FRANCISCO, CAL.
Millwright and Engineer.
Contractor for the erection of Stamp Mills, Roller Mills, Reduction Works, Saw Mills (both circular and band), Aerial Wire Rope and Surface Tramways, etc., etc. Putting in machinery, shafting, etc., of all kinds promptly attended to. Estimates given on plants, complete, including machinery, building material, etc.

British Columbia.
W. J. R. COWELL, B.A., F.G.S., Mining Engineer, Reports on mines, designs and superintends the erection of mining and milling machinery; makes analyses of ores, metals, soils, etc.; arranges for mill tests, and selects suitable processes for the treatment of ores. Correspondence invited. Address W. J. R. COWELL, Victoria, B. C.

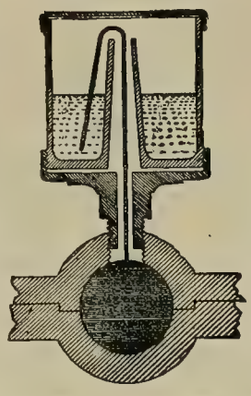
Positively Reduces Oil Bills 75 Per Cent.



THE FINCH OIL CUP.
Frictional vibration by the motion of the shaft against the point of the wire causes the oil to flow, and that this flow is not produced simply by syphonic or capillary action but by frictional vibration is proven by the fact that if the wire does not rest on the shaft then the oil will not flow. When the machinery stops the feed stops, therefore **the Finch Cup is Absolutely Automatic, Feeds Enough Oil and No More, Prevents All Waste, Needs Very Little Attention.**
Read One of the Many Testimonials:
UNION GAS ENGINE CO. SAN FRANCISCO, July 19, 1894.
During the past three years we have used your Cups for the crank shaft bearings of our engines, and also on all bearings of shaftings and tools in the shop. Our engines now *require no attention* except to fill the Cups occasionally, and therefore we can cheerfully recommend the Finch Cups to any one as *being the best in the market.*
K. J. McHUGH, 51 Fremont St., San Francisco, Cal.
General Agent for Pacific Coast. Send for Circular.

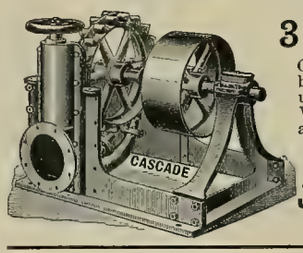
HORACE F. BROWN, CONSULTING ENGINEER.

Special attention given to preparing plans for the Chlorination and Bromine Processes of Treating Gold Ores.
PATENTEE { Brown's Complete Automatic Mill Process. Brown's System of Mechanically Stirred Roasting, Cooling and Conveying Furnaces, Etc.
1607-8 Manhattan Building, Chicago, Illinois.

KENDALL GOLD AND SILVER EXTRACTION CO.
THE KENDALL PROCESS is the most efficient method of using cyanide for the extraction of precious metals from their ores. Wherever this process has been adopted the result has been increased percentages of values recovered and saving of time. Material reduction in consumption of chemical has also been demonstrated with respect to several classes of ores.
All ores, without exception, amenable to cyanide treatment can be treated to better advantage by the Kendall Process. This can be accepted as an axiom.
The Kendall system of gold and silver milling comprises (1) the Extraction Process, in which the chemical solution extracts the values from ores; (2) the Recovery Process, by which the gold and silver are obtained from the solution, and (3) a modified form of plant, not indispensable, but permitting the use of unskilled labor.
Owners of mines and reduction works can obtain full information on application to
KENDALL GOLD AND SILVER EXTRACTION CO.....47 Broadway, New York City.

The General Gold Extracting Co., Ltd.,
PELATAN-CLERICI PROCESS.
Patented in U. S. and Other Countries. Capital, £100,000.
London Head Office.....8 Drapers Gardens.
Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.
This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.
Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.
F. CLERICI, Manager for U. S.

TURBINE AND CASCADE WATER WHEEL
Adapted to all Heads from
3 Feet to 2000 Feet.



Our experience of **33 YEARS** building Water Wheels enables us to suit every requirement of Water Power Plants. We guarantee satisfaction.
Send for a Pamphlet of either Wheel and write full particulars.
JAMES LEFFEL & CO.
SPRINGFIELD, OHIO, U. S. A.

WEBER Gasoline Engine
For use in any place or for any purpose requiring power. Only a few minutes' attention required each day. Guaranteed cost of operation is **1 cent per horse power per hour.** The simplest, most economical and best power. Address WEBER GAS & GASOLINE ENGINE CO., 430 Southwest Boulevard, Kansas City, Mo.

Coast Industrial Notes.

—The Valley Railroad is to be pushed through and beyond Fresno in '97.

—Don Aureliano L. Torres has ordered in Stockton a large quantity of agricultural machinery to be shipped to Sonora, Mexico.

—Tons of grapes are rotting in the interior of Alameda county because of the lack of highways. Complaint is being made of the condition of existing roads.

—The fleet of the Canadian-Australian steamship line is to be increased by the addition of the Arangi, a vessel which recently belonged to the Orient line of steamers.

—The steamer Mazatlan, which has been plying between San Diego and Mexican ports, and owned in Mexico, was wrecked last week in the Gulf of California. Loss $150,000.

—The Wright Irrigation law has been upheld by the Supreme Court of the United States, thus validating about $8,000,000 bonds in this State and giving legal value to the work, which will now be pushed.

—Disastrous storms have been raging in northwestern Washington and British Columbia during the week. It is estimated that the damage to the railroads alone in western Washington will exceed $500,000. The loss to private property will be nearly as much.

—The Board of Regents of the State University have decided to locate the Wilmerding School, for teaching boys useful trades, in San Francisco. Of the bequest of $400,000, it is estimated that $100,000 will be required for grounds and buildings, leaving $300,000 for an endowment fund.

—A new wooden, screw steamship, being built to take the place of the Humboldt, which was lost at Point Gorda last year, was launched last Thursday. The dimensions of the new Humboldt are: Length over all, 220 feet; beam, 31 feet; depth, 13.7 feet; gross tonnage, about 950.

—The California salt business is still extensive. The bulk of the salt comes from the salt ponds on the eastern shore of San Francisco bay, in Alameda county, where last year it amounted to 48,810 tons, valued at $114,575. San Bernardino produces rock salt which is remarkably pure and the deposits are considered inexhaustible.

—According to the Japanese agents stationed at Seattle, as much as 20,000,000 feet of timber recently contracted for from the Puget sound mills is to be worked into ties with which to transform 2600 miles of narrow gauge railroad in Japan into broad gauge, the necessity for this change having been emphasized by the Japan-China war.

—At a meeting of the Yosemite Valley Commissioners last Saturday the question of raising funds for rebuilding the hotel lately destroyed by fire came up. Governor Budd stated that he would recommend that the Legislature pass a bill enabling the commissioners to borrow the necessary funds from the Regents of the State University.

—The San Gabriel Power Company has awarded contracts for work on their proposed plant and it is understood will expend $750,000 during the next year. A large portion of the power will be used to run the entire system of electric street cars belonging to the Consolidated Electric Company of Los Angeles. Azusa will be the center from which the work will be operated.

—The commission consisting of Admiral Walker and four others recently appointed by the President to locate the deep water harbor at Santa Monica or San Pedro, southern California, met in Washington last Monday to organize and outline its work. Congress appropriated $2,900,000 for the work in connection with the building of a harbor and $50,000 for the expenses of the commission.

—Now that Mexico has adopted the metric system of weights and measures, merchants there will be required to make out their Mexican accounts in kilos, litres, etc. This will facilitate the transaction of business at Mexican ports. In the future freight steamers will be charged by the kilo. One thousand kilos will be called the equivalent of 2000 pounds. This adds 10 per cent to the weight and cost.

—The locks at the cascades of the Columbia river have been formally opened for traffic. The construction of the locks was begun eighteen years ago by the Government, but for many years the work was allowed to drag and little was accomplished toward opening the river. In 1892 Congress placed the work under the contract system. A number of prominent men of Oregon and Washington attended the formal opening. The Government has expended about $2,500,000 on this work.

—There is in California 1,250,000 acres of land suitable for sugar beet culture, most of which averages as well as that near Alvarado, where 3705 pounds of sugar is produced on each acre. This would give a total production for the State of 4,631,250,000 pounds of sugar. For the year ending June 30, 1895, imports of foreign sugar amounted to 3,574,510,454 pounds, valued at $76,462,836. Under favorable legislation California could have produced this sugar, and nearly eighty millions of dollars, instead of being sent abroad, would be distributed among the farmers of this State.

—The Funding bill will come up again next month in Congress. Some mortgage antecedent to the railroad lease should be foreclosed, subject to a plan protecting the stockholding interest. The recent extension of the first mortgage debt has eliminated that security from present consideration as an active element. But the second mortgage, held by the United States, is now in part overdue and unpaid, and is available and enforceable for the common benefit of the Government and the stockholders. It is proposed to utilize this incumbrance to wipe out the lease, to discharge the Government debt, and at the same time to preserve, in full force, the bona fide ownership of the property represented by the present stockholders. To accomplish these results, the stockholders should unite with the Government in the effort to apply all the resources of the property to the payment of the debt to the United States, and of dividends to the stockholders. The first mortgage and Government debts, less sinking funds and proper deductions, aggregate about $70,000,000. The net annual earnings of the aided portion of the road are about $2,750,000. It is proposed to issue new securities for the total of the above debts, to bear 4 per cent interest, thus requiring about the amount of the present revenue for its payment. As the Government claims do not in large part mature before 1898 and 1899, they could be capitalized as of July 1, 1898, and, for the amount so capitalized, the new 4 per cents would be issued, on account of the liability, to the Government. In the bill pending before Congress the Southern Pacific Company proposes to perpetuate its control over the property, without in any way providing dividends. It makes the continued existence of the stock interest dependent upon the Southern Pacific's compliance with its proposed guarantee of certain payments to the Government during a long term of years. If the Southern Pacific defaults on this guarantee, all the Government claims are to mature at once and the most summary measures are provided for their enforcement. The passage of this bill would place the stock in this dilemma: The Southern Pacific Company would retain the property, and, judging by the past, would so administer it that it would never earn more than the amount of its debts, leaving nothing for the stockholders. Furthermore, under this bill, if the lease became abrogated, all the debts to the Government would mature at once, placing the stock in imminent danger of extinction. It is for the stockholders to adopt the alternative of relieving themselves from the lease by utilizing the Government mortgage as proposed above.

Personal.

F. P. SCHUMANN, chief engineer of the Guatemala railroad, is in this city.

OSCAR LEWIS succeeds S. H. Tacy as manager of the Manufacturers and Producers' Association.

HAMILTON SMITH was in Montana last week at the Anaconda properties lately purchased by the Exploration Company.

CAPTAIN THOMAS COUCH has resigned the management of the Boston & Montana properties and arrived in this city last week.

WILLIAM A. FARRISH arrived in this city last Sunday from Denver, where he has been making his headquarters for a number of years.

ROLLIN M. DAGGETT of Nevada, ex-Congressman and mining man, has taken an office in this city and will hereafter make his headquarters here.

W. F. PRISK of the Grass Valley *Union* had an overwhelming majority for the State Senatorship from his district. He will be heard from next winter.

LEOPOLD MEYER of Brussels and his brother, C. H. Meyer of New York, arrived here last Sunday. They are interested in mines in Colorado and in Spain.

SOME months ago Judge Rising of Nevada went to Johannesburg, South Africa, to establish a law office there. He has returned, having found it inexpedient.

L. W. MORGAN, of Morgan & Co., Los Angeles, returned last week from Mazatlan, where he has been examining large silver and gold properties for European syndicates.

HON. WILLIAM L. PUTNAM of Portland, Me., United States member of the Behring Sea Claims Commission, and Don M. Dickinson, chief counsel for the Government, arrived in Victoria last week. It is understood the final meetings of the Commission will be held in this city.

THOMAS COUCH has resigned his position as superintendent and general manager of the properties of the Boston & Montana Company in Montana, and Frank Klepetko has been placed in charge. It is reported that Mr. Couch will sever his connection with all the Bigelow properties, including the Merced mines.

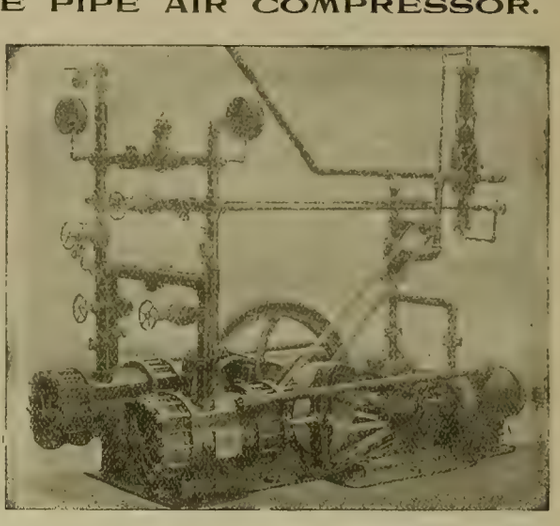
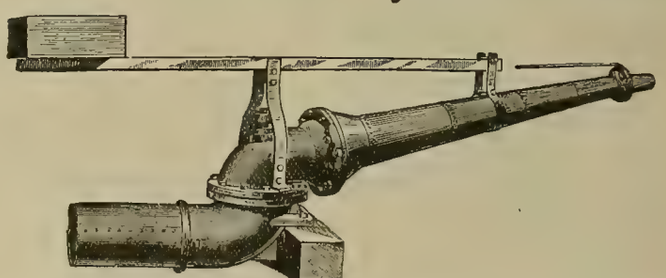
DOUBLE PIPE AIR COMPRESSOR.



This is a cut of the Double Pipe AirCompressor, the Compressor that is guaranteed to save 30% in power over any other make. It is cheapest to buy, cheapest to carry about and cheapest to run. If your fuel or water costs you anything, you want this Compressor. If you can get railroad freights free, and can carry machinery to your mine without cost, and your power costs you nothing, any make of Compressor will do you. You will be under no necessity to write to PNEUMATIC POWER CO., at 306 Pine St., San Francisco, Cal. We could save you money, though, in cost of foundations, as our Compressors are half the size of other makes.

Double-Jointed Ball-Bearing Hydraulic Giants.



The above presents an improved **Double-Jointed Ball-Bearing Hydraulic Giant** which we build. The improvement consists of the introduction of a **Ball Bearing** by which the pressure of the water is reduced to a minimum and the direction of the nozzle changed at will with ease.
Catalogues and prices of our specialties of HYDRAULIC MINING MACHINERY furnished upon application. **JOSHUA HENDY MACHINE WORKS, 38 to 44 Fremont St., San Francisco, Cal.**

Mining Summary.

CALIFORNIA.

Amador.

Ledger: The Bailo mining property, which includes the Hayden, Marre and Allen properties on Sutter Creek, is being graded preparatory to erecting machinery. They have ordered a 40-stamp mill, and intend to commence milling from an open cut. They have a deposit 3000 feet long and over 100 feet wide on the surface.

In the Drytown district the Loyal property has been bonded by the Treadwell Company of Alaska.

The Pocahontas and Potosi have been bonded to a company from Toledo, Ohio. At the Pocahontas they have sunk a new shaft about 100 feet.

Many new claims have been staked out on the serpentine ledge west of Drytown.

Five stamps of the Red Hill Mining Co.'s mill have been started up. The other stamps will be ready this week.

The hoist on the old Mechanics mine has been erected, and the water is out of the shaft down to the 95-foot level.

Mason & Griesbach are milling 200 tons of ore in the Gracey mill in Pioneer creek.

The porphyry deposit at the Robinson is about to be prospected by a company of San Francisco capitalists.

Buckman, Brown & Renn of Napa City have, in company with A. B. McLaughlin, arranged to operate the Acme mine property located near McLaughlin's station above Volcano.

Record: The Reward mine at Pine Grove is having ten stamps added to the mill. The new owner, Mr. James, is improving it considerably with an idea of working it to its full capacity.

McVey & Dagoulia will erect a roller mill with a 20-stamp capacity on the Live Oak mine. It is expected to be in operation inside of two months.

The Trask mine will be sold during the week to San Francisco capital.

Matthew Tyler and N. G. Young of the Tennessee mine have sold out to an English syndicate for a consideration of $60,000.

The Eckart mine has been sold to Eastern capital.

The Anaconda mine has also changed hands, the purchasing parties being Denver capitalists, for, it is reported, $32,000.

Butte.

Mercury: Several men have been put to work on the Mattie mine, sinking, the shaft having been pumped out.

New machinery is being added to the Gold Bank mine. The tunnel will be extended.

The 5-stamp mill on the Mt. Ida mine is crushing ore.

Register: At Thermalito Hammon & Quimby have twenty men at work and are using wheelbarrows in moving the large quantity of earth to reach the pay gravel.

Ditzler & Nelson hoist by steam power, while Treat & Co. use steam cars and are now putting in a second line of track for moving the top dirt. The bedrock is from 30 to 40 feet deep and a vast mass of soil above the pay gravel has to be moved.

Grant & Co. will in a short time open a mine near the others. Eighty men are now employed in the three mines which are operating.

Calaveras.

Chronicle: The California Exploration and Development Company have commenced work on a number of their properties in this vicinity. A contract has been let to run 250 feet of a tunnel on the Vair or Gobbi Ranch; a force of men are at work cleaning out and retimbering the old Wesson tunnel on the Maloney Ranch, and men are to be set at work on the Clorac property. At the power plant on the Mokelumne river the work of grading has all been finished and the foundation for the building is now being laid. The building, which is to be of steel, will be 35x100. The plant when completed will cost $126,000.

A cleanup made at the Encino mine after a couple of weeks run was very satisfactory to the owners, and sufficient to establish the mine as a dividend-paying proposition.

Mountain Echo: At the Great Western mine, between Angels Camp and Altaville, owned by Frank Baumhogger, a test of ore has been made, the yield of which was $26.87 in gold and 65 cents in silver. The shaft is over 70 feet deep and the vein or fissure about 6 feet wide. This mine was worked more or less in early days.

Good ore has been struck in the Calaveras mine at Robinson's Ferry.

Citizen: The Womble mine which has been bonded lately, at a depth of 210 feet has struck some rich rock. The vein is 17 feet wide.

The Dimond Jack, owned by J. W. Howard, is down about 50 feet. The ledge is 9 feet wide and rich in free gold and sulphurets.

The Royal has been sold for $300,000.

Angels *Voice:* The property to be worked by the recently organized Kaolah Mining Company includes the Garnett ranch of 100 acres, adjoining the Tryon property on the south, for which $3000 was paid a few months ago. They will commence work within the next sixty days, and will sink a 500-foot shaft.

El Dorado.

Georgetown *Gazette*: C. Keeney is making a number of improvements at the Ohio mine.

At the Blue Gouge mine they are now in 400 feet and getting good pay.

Kern.

Californian: At Garlock, Randsburg district, a well has been sunk and site graded for a new 10-stamp mill. Preparations are being made to put in a cyanide plant to handle about twenty tons of ore per day.

The only mines being worked at present are those producing free-milling ore. There are a number of locations in the immediate vicinity of Garlock of good veins of base ore that will probably develop into paying mines as soon as provision is made to work this class of rock.

At Randsburg there are nine quartz mines being worked at present, the ore running from $20 to $150 per ton and some select ore as high as $800 per ton. The majority of the ledges run from 4 to 6 feet in width, with the exception of one belonging to the Randsburg Mining Company, which is 80 feet wide and is completely uncovered for a length of 300 feet. This belongs to Burcham, Singleton, Mooers and Reddy, along with a group of eight others of less proportions. They are sinking on five or six of the leads. One is already down to the depth of 100 feet.

Los Angeles *Herald*: The total number of men working in all the quartz mines is seventy-six, not including the foremen. There are a number of men working in placer diggings with but little success, most of them making below $1 per day, using dry washers for separating the gold from the gravel.

The strip of country monumented for mining purposes is about eight miles wide and about fourteen miles in length. Everything is located regardless of whether there is anything in sight or not.

The great drawback to the camp is the lack of water. The nearest point where it can be produced is fourteen miles. Water hauled into Randsburg sells for $1.50 per barrel. The nearest point for milling ore is thirteen miles, where there is one mill with two stamps and another with four stamps, and they are unable to run steadily for lack of water. These mills are at Garlock. There is a small 5-stamp mill at Mesquite springs, sixteen miles from the mines. There is also a 5-stamp mill at Kane springs, about twenty-six miles away. All combined are not capable of crushing the ore that is being mined in that district. The population of Randsburg is about 500.

Mariposa.

An English company, it is reported, will soon acquire a group of about sixty claims, four of which are old mines which formerly paid well, and are all near the town of Hornitos. They were purchased about a month ago, principally from M. L. Rogers, by S. W. Parker of New York, who formed a California corporation known as the Hornitos Gold Mining Company. Its capital stock was placed at $2,500,000. San Franciscans were placed in the directory, Charles Sonntag was made vice-president and general manager and W. H. Chapman was appointed attorney for the company; but Parker remains the principal owner, though now he is about to transfer the control to an English syndicate other than the Exploration Company of London, whose negotiations for the Mariposa grant property have been made public. The chief developed mines in the Hornitos group are the Washington, which was worked as early as 1852 and in which a 1500-foot shaft was sunk; the Quartz Mountain, on which are ten stamps; the Jenny Lind, No. 5 and No. 9, on which $750,000 has been expended at one time or another and on which there is a 30-stamp mill.

Gazette: Nelson, Branson & Valberde have bonded the Westminster, near Cotton creek, to a San Francisco company, who are at present prospecting it. If it turns out satisfactory there will be a mill erected.

The Dorse mine is running in full blast under the management of C. E. Stewart. The main shaft is down about 350 feet, with levels running both ways from 200 to 300 feet.

Nevada.

Union: The Old Home Consolidated mine near Blue Tent is producing some high-grade ore.

G. D. McLean has become interested in the Greenhorn mine, and a mill will shortly be put up.

A complete steam hoisting and pumping plant has been purchased and shipped to the Randolph Gold Mining Company's property at the Rodda ranch.

Placer.

Colfax *Sentinel*: The Blue Canyon Mining and Development Company own 1000 acres of the lava-capped ridge below Blue Canyon, and it is supposed to contain more than one and one-half miles of the gravel channel. From the tunnel now being run an upraise will be made at 2000 feet from the mouth.

The California Mining Company at Yankee Jims have finished work in their canyon for the season.

Hoffman & McDonald of Forest Hill have leased and are preparing to hydraulic the Gilbert claim, on Georgia hill, under permit from the Debris Commission.

Plumas.

Independent: Work on the Gold Bar property on the Middle Feather will be prosecuted during the winter. A contract to extend their tunnel has been let by the company. The company have in contemplation the working of the present river bed and the bars where it formerly ran for a distance of several miles between the mouths of Washington and Dogwood creeks. The waters of the Feather river will be utilized for the generation of electric power. The plan of operations comprehends the running of a deep cut from the lower end of the bar upon which mining operations so far have been conducted, to the head thereof; and when the bar has been worked, the rivers may then, if deemed expedient, be turned into the cut and the river bed worked. It is the intention, however, to work the entire river bed and each bar on the property if profitable to do so. Aerial tramways will remove the displaced earth. Should the hopes of the owners of the Gold Bar property be realized, a new field will be opened for the profitable employment of mining capital in our county, as but few of the streams in Plumas, however rich, have been thoroughly mined. Besides, much gold from the hill diggings, suffered to escape by imperfect or insufficient gold-saving appliances, has for many years been finding its way to the rivers and creeks, thus increasing the stores of wealth overlooked and consequently undisturbed by the pick of the early miner.

Marysville *Democrat:* Near Eagleville a quartz lode has been developed, and a company composed of capitalists who reside in Oakland have finished hauling the necessary machinery to erect a good quartz mill on it.

Two miles west of Strawberry valley, C. A. Stratton and associates are developing a quartz lode known as the Berry mine, and it shows free gold in quantities to prove its value. A mill will be erected on this claim next spring when the snow will permit of proceeding with the work.

Drake & Co., on their claim in the Barton House hill, have been nearly two years running a tunnel to develop it. There is a rich bed of gravel where they are now drifting, and in three weeks they washed out sufficient gold to pay half of the entire expense incurred, while the indications promised rich returns in the future.

Shasta.

W. B. Murdoch has sold the Sybil group of mines in French Gulch district, Shasta county, to a New York company, who will work it on a large scale.

Democrat: The Uncle Sam mine, which had been given up as completely worked out by the owners, the Sierra Buttes Mining Company, has again come to the front with a richer body of ore than had ever before been worked on the property.

At one time the Uncle Sam was the best paying mine in Shasta county, but lately had seemed to "peter out," and the large force of men had been gradually laid off until there were but about a half-dozen in number left, and they were employed getting out the machinery preparatory to shipping it to the company's property in Montana.

About two weeks ago Thomas Johns and Henry Rickard secured a lease on the mine for six months, and, after following a small lead for 20 feet, uncovered a body of ore about 4 feet in width, richer than any rock yet found in the mine.

At a meeting of the Sierra Buttes Company lately in London, it was reported that the Uncle Sam mine produced during the past half year 12,995 tons, yielding $58,600, at a cost of $52,770 The original cost of this mine was $150,000, and during the seven years the company has owned it, it has yielded gold amounting to $1,100,290, on which there was a profit of $422,515.

Courier: There is being run by contract a 300-foot contract tunnel on the Flick, Stolberg and Maurer property on Shurtleff hill. The promoters of this enterprise have good encouragement in the way of ore to justify the work.

Free Press: The National Mining Company, at Rich gulch, are increasing their force of miners and will soon run the mill day and night.

E. P. Conner has sold his mine at the Tower house to W. J. Hunt of Sebastopol, Sonoma county. There are two tunnels on the property, each 150 feet long, and the surface croppings are quite extensive.

At Harrison gulch Captain Roberts and Johnny Frank have all the machinery on the ground for a stamp mill, and are still pushing their tunnels and uncovering larger rich ore bodies.

Hurst & Fowler are getting out good ore and developing their property. They shipped ten tons to Selby's at Vallejo Junction recently which averaged about $175 per ton.

Sierra.

Enterprise: The Sierra Gold Company, on the East Fork, are running their quartz mill on ore taken from the large vein. The ledge is 24 feet wide and the ore is said to average $4 per ton.

Mountain Messenger: The owners of the Bigelow mine made a satisfactory cleanup lately. The rock goes $3.50 per ton.

The reduction works are still running at the Young America mine.

At the Chipps mine they are taking out good rock and the mill is being run for the first time in two years.

Siskiyou.

Journal: The ditches and creeks are said to all carry a good head of water, and the smaller placer claims will soon be enabled to start work.

The Seattle Placer Mining Company, on Thompson creek, are about ready to start up work. They have one of the best placer mines in the county, and with the improvements they have put on their property in the past year, the result this season should be far better than heretofore.

The Classic Hill property, a hydraulic mine on Indian creek, near Happy Camp, owned by Mathews & Vogan, has been worked during the past season and is reported to have proved successful. It is a property that requires judgment to handle, as the character of the earth is such that the pipe and machinery may be all swept away by a landslide, unless it is watched.

Etna *Reporter*: The Columbia mine is still in operation, with good ore in sight. The last shipment of bullion for less than a month's run was over $2000.

Mr. Chamberlain has a full force at the Mabel, the mill is kept in constant operation and the rock is yielding well.

Work on the Gumboot mine has been suspended for the winter.

News: The output of Siskiyou's mines next season will double that of any previous season, if indications count for anything. Two large mines, which have not been worked for years, are being fitted up, and several new mines, which have passed into the hands of companies with capital, will be placed in the line of producers. It cannot be said that Siskiyou county is experiencing a boom, but the steady growth of her mining interests has assumed proportions most encouraging to the progressive element.

Trinity.

Shasta *Free Press*: David McCleary of the firm of Bloss & McCleary has sold to James R. Eligh of Redding a half interest in the company's placer mining property of 800 acres of ground, surrounding the town of Trinity Center, including a water right on Swift creek and the ditches, flumes, pipes, giants and other machinery. Mr. Eligh will organize a stock company to continue the working of the property. This hydraulic originally consisted of 2000 acres of gravel, and after having been worked continually for the past thirty-five years there now remain over 800 acres. The purchase price was between $35,000 and $40,000.

Journal: On New river the Sherwood mine is running at full blast, having plenty of water to run the mill.

Clark Butcher, while mining on Kingsbury gulch, Hay Fork, the other day, found a nugget that weighed $14.50.

At Junction City the miners are all waiting for water.

Tuolumne.

Angels *Voice*: The Mammoth mine, at Jacksonville, is turning out $10 ore from a 25-foot vein.

L. W. McClauflin of San Francisco, on Saturday last, paid $2500 for the Homestake mine at Jacksonville. It is between the Mammoth and Eagle mines, both of which are paying properties.

The Golden Gate mine has resumed operations.

NEVADA.

(Special Correspondence).—The Pyramid City camp on Pyramid lake, thirty-two miles northeast of Reno, is again the seat of activity, this time over a gold discovery. The first locations were made by Hank Miller, (one of the earliest Comstock miners) and Antone Dragovich, about two miles south of the old Pyramid City. High value rock was brought to Reno for assay and fully fifty men are now working on this camp, and houses are being built. The whole of the old camp has been relocated. A two-ton mill run made at the reduction works returned $60 a ton gold. This was ore taken from the Miller & Dragovich claim within 6 feet of the surface. The silver was lost in the treatment.

Reno, Nov. 18, '96.

Reno *Gazette*: The Gold Creek (Nevada) Mining Company is developing placer properties in the Island Mountain district, eighty miles north of Elko. They are employing 150 men and a hundred teams, put to work during the last three weeks, and are daily putting on more. They are constructing a storage reservoir that will hold 3,000,000 gallons of water, enough for five months' run in the dryest of seasons. A great deal of the ground being mined goes from $5 to $25 per cubic yard, and the average is sixty odd cents.

The old Dixie mine in Tuscarora, which has has been idle for the past four years, recently fell into the hands of Salt Lake men and is being developed into a fine property. They have erected cyanide plants and mills, which are now running night and day. The company has recently purchased the adjoining ground called the Caprice, paying $30,000 for it. There are other gold properties under bond in the district, and, altogether, Tuscarora is enjoying a gold mining boom which is based upon an actual gold output.

In western Nevada at present for some reason more attention is being given to placer than to vein mining, says the Salt Lake *Tribune*. This is probably because at small cost for machinery sufficient gold to pay fair wages may be quickly obtained. In the western and central parts of Nevada are more placer deposits than was generally known to exist when all come to be looked up. Such of these as are so situated that water may be cheaply brought upon them are being worked more or less extensively. In places, however, there are large areas of placer ground for the working of which water cannot be obtained except at great cost. These our people cannot touch, though some are very rich. In a few places, as about Osceola, there are placers so rich that they are being profitably worked by the use of dry washing or winnowing machines.

Carson *Appeal*: The 200 miners who are going to work on the Cortez mine turn out to be sixty Chinamen.

The Hendra group of gold mines at Dun Glen, has been sold for $20,000, and the new owners are putting up a 10-stamp mill. Several thousands tons of free milling $9 ore is in sight.

F. C. Everett is moving a 10-stamp quartz mill from Alpine county, Cal., to a point near Buck Springs in Smith valley, to work ore from the Top Notch mine and also from the McConnell and Emerson mines.

Pioche *Record*: A mining district has been regularly organized at the Copper mine, about thirteen miles from Bunkerville, in this country, where Stewart and Nay have been for some time past at work opening up what is regarded as one of the best copper properties ever discovered in this section. Stewart and Nay represent Lane and Hayward, San Francisco mining men.

OREGON.

In southern Oregon the miners are much encouraged with the prospect of a favorable season. Some of them have water sufficient to commence work.

A. Lewis has a large force of men at work on the old Taylor Placer Mining and Milling Company property, extending the ditch to supply the mine with water for this season's run.

Twenty tons of silica were shipped from the

Mosier mines down on the Columbia, to Boston, last week. No one there knows what is being received for it. The cost of mining it and delivering it f. o. b., at the Mosier depot is about $12 per ton. The silica mines now give employment to eight or nine men.

Baker City *Bedrock Democrat*: In the Cracker Creek district the E. & E. Con. Mining Company, John Longmaid & Co., lessees, besides keeping their mine and 20-stamp mill in operation, have started a line shaft on the Eureka and Excelsior mines. Immense ore bodies are exposed.

The framework of the new mill at the Columbia mine is finished. It is expected the mill machinery will be in place in the next ten days and the plant ready for operation shortly. The Columbia is an extensively developed property and there is enough ore blocked out for a continuous mill reduction.

The Luverne Mining Company, of Minnesota, recent purchasers of the Ohio mine have commenced mill building.

At the Bananza mine a tramway 2,000 feet long is to be put in, and an electric plant for lighting the mine and mill. New machinery for an additional twenty stamps for the mill is on the way to the mine.

WASHINGTON.

Spokane *Chronicle*: In Okanogan county the Squaw Creek Mining & Milling Company is about to push the tunnel on the Schulz mine in 500 feet farther along their ledge.

The Black Bess, a 6-foot vein of gold and copper bearing quartz, near the Schulz, will be worked all winter by D. H. MacLachlan & Co.

Many new strikes have been made and a wagon road has been built from Methow to Gold creek.

BRITISH COLUMBIA.

Spokesman-Review: An assessment of 1 cent a share has been declared against the stock of the Poorman Gold Mining Company.

The Little Phil, a well-known mine at Ainsworth, has been bonded to H. Clark Wallace for $20,000.

The Republic group of three claims, in the Slocan, have been bonded to Hector McPherson of Brandon, Manitoba, for $25,000, 5 per cent down. Sutherland and Montgomery are the owners.

David Bremner, acting for the Scotch syndicate he represents, has bonded the Wakefield, Ottawa and Cazubaza for $25,000, 10 per cent cash.

It is reported that a deal is on for the sale of the Alpine group of mines, located at the head of Eight Mile creek, on the Slocan divide. The consideration is $80,000. The purchasers are a New York syndicate.

ALASKA.

News: L. Nicolai of Portland, Or., has made the first payment of $15,000 to Frank Bach for the Horrible and Mexican mines on Berner's bay. Mr. Nicolai will continue development work all winter, and as soon as the weather will permit he will begin the erection of a 20-stamp mill. The total investment will approximate $120,000.

The recent addition of sixty stamps to the Mexican mill has so crowded the Treadwell Chlorination Works, which handles the sulphurets from the Mexican as well as the Treadwell, that its capacity has to be increased proportionately. A new roasting furnace is being constructed.

UTAH.

Salt Lake *Tribune*: The Easter, Magpie and Judas, in the Willow creek district, have been sold by D. B. Levan to Col. Dewey for $20,000. A force of men will be put to work, and it is stated that a 20-stamp mill is to be erected on the property as soon as the machinery can be placed on the ground.

At Mercur the Sacramento continues to surprise the camp by the extent and richness of its ore bodies. Another rich face of ore was struck a few days ago which runs over $20 to the ton, with occasional samples which run much higher.

The Geyser also struck a fine body of $16 ore within the last few days, which is showing up well. The Geyser has probably got the cost of mining and milling its ore down to a lower point than any other mine in the camp, although to accomplish this they have had to open up a great many workings.

It is understood that the Sacramento next month will begin paying dividends.

Park City *Record*: The indications are that Park City's list of dividend payers will soon be increased by the addition of the Daly-West and Vallejo.

Prospecting by claim owners in this district, instead of dropping out of sight as predicted, is being prosecuted with the same vigor as of yore.

Bingham *Bulletin*: Bids are being received for the construction of the Highland Boy mill.

The force at the Dalton & Lark has been increased. During the past few weeks a large area of stoping ground has been blocked out and several important strikes made.

John T. Donnellan has taken an option at $25,009 on the Monterey and Iron Duke claims, upon which development will begin at once. The claims are located a half-mile northeast of Silver City.

The mill on the property of the Ophir Hill Mining Company on Lion hill has shut down for the season. The output during the season, that covers a period of less than six months, has been 6000 tons of concentrates, that were derived from 25,000 tons of crude ore.

The Mammoth, on account of extensive improvements being made, has passed its regular dividend.

IDAHO.

The report of the De Lamar Mining Company for September shows: Number of tons crushed (wet), 4,355.13; number of tons crushed (dry), 3,194.64; assay value of the pulp: gold, $12.20; silver, $8.06; total, $20.26; assay value of the tailings: gold, $3.69; silver, $1.81; total, $5.50; percentage saved, total, 72.85; number of ounces pure gold produced, 1,569.327; number of ounces fine silver produced, 39,877.23; value of gold produced (at $20), $31,386.54; value of silver produced (at 65c.), $25,920.18; surplus on bars to date, $1,303.40; ore sales, $5,200; miscellaneous revenue, $295 $64,105.12; deduct all expenses for the month, $44,089.33; estimated profit for the month, $20,015.79.

Inter-Mountain: A dispatch from Wallace says that it is rumored that the Helena and Frisco has been sold to the Standard Oil Company. This is one of the most valuable properties on Canyon creek, employing 125 men and milling 525 tons of ore daily. The mill is one of the most complete in the Cœur d'Alenes. Recent additions to machinery have been made that will increase the capacity until 600 tons can be milled. Monthly dividends of $50,000 have been paid with few intermissions for several years.

MONTANA.

Mining World: The copper claims in the Murray district, Meagher county, are once more being prospected—this time systematically.

The county of Flathead is attracting considerable attention on account of recent discoveries of copper. Metal has long been known to exist in several parts of the county. A new district was discovered the past summer known as the Talley's Lake district. Specimens have been sampled which give assays as high as 60 per cent copper and $5 in gold.

It is stated that the Sand Coulee Coal Company intends to open up the mines owned by it near Armington. The company owns 1,000 acres of coal land on the west side of Belt creek.

About 4,000 tons of coal are produced daily at Sand Coulee and Belt by the Sand Coulee Coal Company and the Anaconda Company, and yet not one ton of this product could be secured for domestic purposes until within the past month when the first named company established an agency at Butte. The entire product of the Sand Coulee mines has been taken by the Great Northern Railway Company, and the Belt output of a hundred or more cars per day goes to the smelters at Anaconda.

Reports have recently been received of important discoveries of copper in Deer Lodge county at the headwaters of the Big Blackfoot river. A Helena company has several men in that vicinity and they have made numerous locations.

SOUTH DAKOTA.

Black Hills *Times*: At the Homestake the new steel tramway from the Ellison shaft to the Golden Star mill is about completed. The bridge portion extends over both branches of Gold run and is over 800 feet in length, with 70-foot spans.

The Highland Mining Company has paid in dividends since January 1, 1896, $120,000 and a total to date of $3,204,900. The Homestake Company has paid this year $312,500 to its stockholders in dividends and a total to date of $6,055,000.

The Pittsburg, Pa., parties who purchased the Amazon group of claims a few months ago are grading for a steam hoist and a residence for their superintendent. At a depth of 35 feet the vein was crosscut and found to be fully 30 feet between well-defined walls.

Rapid progress is being made in placing the machinery and monster Cornish pump at the Union shaft, and it is expected to be ready for work December 1.

On the Union Hill proper the shaft is down 300 feet, on which level 300 feet of drifts and crosscuts have been driven on and in the ore body. The Hoodoo tunnel on the same property is now in over 400 feet and is being advanced to the shaft, which is yet about 700 feet distant. The size of the ore body may be estimated from the fact that the tunnel and the bottom of the shaft are in the same ore body, which, according to mill tests, yields an average of $5 per ton by ordinary amalgamation. It is the company's intention to erect a 100-stamp mill.

COLORADO.

The Pomeroy mine, located above Capital City, was recently placed with Leadville mining men, and its development is now under way.

Ouray *Herald*: Last week the Yankee Boy 60-ton mill, one of the best equipped modern plants in the San Juan, was started up. The Yankee Boy group has in sight 50,000 tons of ore.

Denver *Republican*: As the American patents of the MacArthur-Forrest Company are for the use of a diluted solution of cyanide, and not so sweeping in their nature as the patents involved in the South Africa decision, the verdict of the court in South Africa will have no effect here. The general ground of the American patents was overhauled in the case which was tried last summer in the Federal court at Salt Lake City, where the decision favored the American branch of the MacArthur-Forrest syndicate. In the plant at Florence, the largest of its kind in the United States, patents other than those of the MacArthur-Forrest Company are in use. They belong to Manager Argall and are controlled in this State by the Moffat-Smith Company.

At the Moffat-Bush tunnel, under the south spur of Gold hill, the bore is not yet 2000 feet on its way, but the drain, 2x4 feet in size, is filled within a few inches of the top, and the water coming out would run all the mills the Cripple Creek district needs at present. The tunnel is only approaching the area where pay veins can be expected, and is not more than half way to the Anaconda vein. In the early days it was thought Cripple Creek was always to remain a dry camp, but the number of pumps that are now being required to drain the mines increases the need for large tunnel enterprises such as the Moffat-Bush and others that are now being driven.

Production from the Isabella for October is estimated at 900 tons, of which 475 were of smelting and 425 of milling grade. Partial returns from the smelter on October ores indicate that the values are improving, the ore shipped having an average value close to $70 a ton. The reserve fund in the treasury at present is $60,000.

The Union Gold Company mined twenty-four broad-gauge carloads of ore during October, and the money value net from the smelters is given at $25,000.

Last week the Gold Coin shipped twenty-five carloads of ore, and the production from the three main workings holds steady at about thirty-five tons a day.

Mining Record: Eastern capitalists are negotiating for the purchase of the Bald Eagle mine at Ward.

The Belcher mine, at Carinou, has been sold to John B. Adams of Laramie City, W. H. Smith of Salt Lake and others by J. W. Irwin of Boulder. This property was sold some years ago for $100,000, and during the following year $42,000 worth of ore was taken out.

The Electric tunnel is surveyed to run from Squaw gulch through Bull hill, at Cripple Creek, a distance of 3000 feet. It is intended as a tramway tunnel, and as it will pass through the American Eagle, Favorite, Grouse, Union, Pharmacist, Grotto, Zenobia and other rich mines at a great depth, the revenue from the hauling of ore is expected to pay all expenses and enable the company to pay dividends.

Last month the Florence cyanide mill treated 4000 tons of ore of an average value of 1.07 ounces per ton, making the yield for the month about $82,000. The new roaster adds eighty tons daily to the capacity of the mill, which was previously 120 tons.

Mining Investor: The following are offered as conservative estimates of the output for 1896, of the different mining districts of Colorado:

Clear Creek	$ 500,000
Boulder	700,000
Gilpin	2,000,000
Summit	100,000
San Miguel	3,000,000
Ouray	700,000
Cripple Creek	9,500,000
Lake	1,000,000
Silverton	1,000,000
Total	$18,500,000

The Independence has been shipping heavily during the past month, and it is thought the output will hold at least five tons a day. In the seventh level, from which the ore is now coming, a new chute of sensational ore was entered a few days ago. The mill at the property is shut down, awaiting the arrival of a new and larger pulverizer.

The Anaconda Company has paid off $80,000 in debts since August 1st and are now free from liabilities. They have been spending years in development work, and now have immense ore reserves in sight and can mine at a less expense probably than any other company in Cripple Creek. In October over $50,000 was produced at a cost of only $8000, and it is not at all improbable that this showing will be surpassed in a very few months.

NEW MEXICO.

Silver City *Enterprise*: A strike of rich ore has been made in the Big Blossom mine, owned by Crawford and Woodward. The mine has heretofore had a good body of ore and has been producing twenty-five tons per week. The new strike is an increase in both quantity and quality. The ore body is over 4 feet in width and will average over $100 per ton in gold and silver.

Thomas Knucky of the Caldwell and St. Louis mines is producing about twenty-five tons per week of average grade copper ore, besides a small amount of high-grade ore.

At Pinos Altos the Treasure Mining Company has fifty men employed in the mine and mill. The ore is very base and but a small proportion of the gold value is saved on the plates. Five tons of concentrates are produced daily.

Bell and Stevens have put the No. 1 shaft in the Pacific down 410 feet. Their mill is kept crushing ore taken out in development work in the Pacific and Mina Grande mines.

ARIZONA.

Bisbee *Orb*: The new shaft at Pearce, near the bonanza mine of the company, is now down 100 feet, and is showing up equally well with the original shaft, showing that the entire length of the immense ledge of this property goes down.

From the La Fortuna mine, near Yuma, the gold is shipped in 400-pound bars, and the monthly output is reported to be between $80,000 and $100,000. The 20-stamp mill is crushing 80 tons of ore a day. Two years ago the La Fortuna was sold by three prospectors for $150,000.

Tombstone *Epitaph*: The Copper King Mining Company, which owns twenty-two claims near Bisbee adjoining the Copper Queen, was lately incorporated for $5,000,000 by New York men.

Prescott *Journal-Miner*: The Gladiator mill in the Bradshaw mountains has been started up again.

The Crowned King mill is again dropping its stamps day and night.

At the Columbia group of mines, in the Humbug district, sixty men are taking out ore from the Tampico and Yankee Blade. It is the intention of the company to extensively develop the property before building a mill, and if the ore bodies continue to show the results now obtained, a complete plant will be erected.

SOUTH AFRICA.

The directors of the Consolidated Gold Fields of South Africa (Limited) in their annual report place the net profits for the year ending June 30, 1896, at £1,119,726 6s 8d. After paying dividends a balance of £1,303,203 1s 6d was carried to the credit of this year. Dividends amounting to 25s per share were paid during the year.

One of the company's most important holdings is the Simmer and Jack Proprietary Mines (Limited). An issue of £500,000 5½ per cent first mortgage debentures has been made to partially provide for equipment and development of this property. The property worked by the company itself from the outcrops down amounts to 609 claims, and has almost, if not quite, the greatest length of outcrop of any of the Witwatersrand mines, extending nearly a mile. The continuity of the main reef series has been proved by a borehole to a depth of 2397 feet. In addition, the Simmer and Jack have holdings in other companies working on the freehold of the Elandsfontein estate, owned by them, which amount to nearly six hundred claims.

The company's holdings in the Gold Fields Deep include the following:

300,500 Robinson Deeps. (Total capital of company £400,000.)
48,992 Rose Deeps.
160,966 Glen Deeps.
153,350 Knight's Deep.
21,804 Simmer and Jack West.
37,725 Simmer and Jack East.
136,081 Rand Victoria Mines.
165,259 Jupiter Gold Mining Company.
5,000 Village Main Reefs.

CLAIM AND ESTATE HOLDINGS.

99 Claims under Henry Nourse.
457 Claims on Elandsfontein and Doornfontein.
½ Interest in Booysen Estate, containing 807 claims under Crown Reef, Crown Deep, Robinson, Robinson Deep, and other first-class properties.
¼ Interest in Ingramsburg Estate.
45 Per cent interest in Concordia Estate.
Interest in Klipriversburg Estate.
Interest in Turffontein Estate.
Interest in Vierfontein Estate.

In connection with these boldings John Hays Hammond, the company's engineer, quotes from the opinion of Prof. George F. Becker of the United States Geological Survey as follows:

"There is to my mind no doubt that if dynamite and freight charges on coal were at reasonable rates, and if the labor were better, and better economized, the Rand mines could now mine and mill ore for 18s per ton, the present expense being approximately 26s," and further summarizes his report as follows:

"In brief, then, it is very improbable that the ore of the deep mines in the region through which the main reef has been traced with certainty will show any general tendency to impoverishment; dykes and faults will probably give less trouble in the deep mines than in the outcrop mines; there is no ground for fearing unmanageable quantities of water, or even very serious pumping expenses; and the temperature will increase more slowly than in most regions. There are, in my opinion, no insuperable natural obstacles to mining on the Witwatersrand at a depth of 4000 feet, and no known reason why, under favorable industrial conditions, the expense should exceed the present cost at 500 feet."

As to Rhodesia the report says:

"The native outbreak in Rhodesia has necessarily retarded the progress of the country, and temporarily put a stop to business. The revolt, however, appears to be on the eve of suppression, and when the railway works now in hand are completed the interests previously acquired by the company will receive increased attention."

As to the condition of mining on the Rand the directors say:

"The mining industry in the Witwatersrand is rapidly attaining that importance and value which the directors have long foreseen. The political disturbances at the commencement of the year 1896 caused a not inconsiderable interruption to its development, but the yield of gold reported since the resumption of full work reached the record total of 212,429 ounces for the month of August, 1896. There is no doubt that this total will be very considerably surpassed in the near future, and that the Witwatersrand, in spite of fresh discoveries of gold in Australia and elsewhere, will remain at the head of the gold-producing districts of the world. The profits to the individual mines represented by the large aggregate yield above quoted have been very considerable, but it is estimated that the reduction in the pay of the native laborers which was inaugurated on October 1, and the beneficial results from restricting the supply of liquor, will result in diminishing the average cost of extraction by about 2s per ton of ore, or 5s per ounce of gold obtained, in which case the ratio of profit to the amount of gold produced will be largely increased. Certain legislative measures recently enacted are likely to improve the position of all classes employed in connection with the mines, judicious revisions of the conditions under which the work is carried on and necessary material is obtained, and due recognition of the pressing need for railway extension will further promote the success of the industry to the advantage of the republic and of all interests therein.

"Arrangements have been made with Mr. John Hays Hammond, who has previously acted as consulting engineer to the company in Johannesburg, to remain as the company's consulting engineer in London for a period of three years from July 1, making periodical visits to Johannesburg. Mr. Hammond's service and experience are placed solely at the disposal of the company for this period, his remuneration being covered by 1½ per cent of the net realized profits of the company. Mr. H. H. Webb has been appointed resident superintending engineer at Johannesburg, to take control of the engineering staff there."

Prof. Emmens' Discovery.

In a recent issue of the MINING AND SCIENTIFIC PRESS were published some extracts from an editorial in *Industries and Iron* in reference to Prof. Stephen H. Emmens' reported discovery of a means of transmuting silver into gold. In justice to Prof. Emmens is herewith published his reply as follows:

NEW YORK, Nov. 10, 1896.

To the Editor Industries and Iron, London:—I have been shown a quotation from a recent editorial article in your journal making an attack upon me in connection with my chemical work relating to the molecular constitution of gold and silver. This attack seems to me to be based upon various erroneous reports that have found their way into the newspapers. I trust, therefore, you will permit me to make, in your columns, the following statement respecting my attitude on the transmutation of metals.

1. I assert and am ready to prove, if challenged to do so, that many of the most eminent men of science of to-day as well as of past times, regard the transmutation of metals as being possible.

2. I assert, but am *not* ready to prove, that the conversion of silver into gold is an accomplished fact. I do not make this assertion in the hope or expectation of its being believed by anybody, whether scientific or unscientific. If Lord Kelvin or M. Berthelot were to make the like assertion, unsupported by proof, I should not feel myself called upon to believe it. I should not, indeed, doubt the veracity of such eminent men, but I should hold myself at liberty to deem them mistaken.

3. All that I intend or really do in the premise is to enter what may be termed a public caveat. I am firmly convinced that the end of the present century will see the advent of a new school of chemistry and physics which shall teach the way to technical progress far surpassing what has been accomplished under the doctrines hitherto accepted. I am not alone in this conviction; it is shared by many of the leading chemists of the day. I therefore conceive it a matter of scientific duty on my part to boldly throw down the gloves of priority at the feet of my fellow-investigators. I issue my challenge to the whole world of science. If anyone thinks himself my predecessor in the art of transmuting metals, let him make public his claim. I will meet him, claim for claim and *proof* for *proof*. If none take up my gage, my claim to be the pioneer and leader of the new chemistry will at least remain undisputed, and must be universally conceded whenever I may think proper to reveal its foundation of fact.

Your obedient servant,
STEPHEN H. EMMENS.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING NOVEMBER 10, 1896.

571,060.—MOLD PATTERN—M. A. Baker, Los Angeles, Cal.
571,302.—BICYCLE—L DeRome, S. F.
571,086.—PUMP POWER—Fulton & Ames, Galt, Cal.
571,115.—AIR BRAKE—F. L. Guillemet, S. F.
571,116.—AIR BRAKE—F. L. Guillemet, S. F.
571,320.—CAR FENDER—Holloway & Starkweather, Los Alamos, Cal.
570,937.—STOVE LID—G. B. Littlefield, S. F.
571,275.—SCREEN FOR URINALS—Maxwell & Gorman, Los Angeles, Cal.
571,009.—REGISTER—H. S. McCormick, Oakland, Cal.
571,054.—SAFETY PIN—A. T. Snell, Santa Barbara, Cal.
571,102.—METALLIC TOOTH CROWN—L. L. White, Oakland, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

MOLDS FOR SHAPING METALLIC TOOTH CROWNS.—Louis L. White, Oakland, Cal., assignor of one-half interest to Walter F. Lewis, same place. No. 571,102. Dated NOV. 10, 1896. The object of this invention is to provide a means for shaping seamless metallic tooth crowns into accurate form. It consists of a casing or shell, a core of soft metal seated in the shell having a hole for the reception of a metallic die, the mold having a central perforated lower section, an upper section removably fitted thereto having a conical hole, the lower end of which aligns with the hole in the lower section. The core of soft metal is formed in readily separable sections and fits into the conical hole of the upper section of the casing or shell.

IRONING TABLE.—Charles I. Hofwolt, Santa Rosa, Cal. No. 570,636. Dated Nov. 3, 1896. The object of this invention is to provide an ironing table which is adapted for handling with ease and precision large articles, keeping them compact, out of the way and smooth during the operation of ironing. It consists of a frame having a suitable ironing board at its top, a readily removable and transferable roller at one side of the frame at which the article to be ironed is first rolled and from which it is gradually unrolled as the work proceeds, a similar readily removable and transferable roller on the opposite side upon which the article is again wound as the ironing progresses and pawls, ratchet wheels and a power device for operating the rollers.

ROTARY PUMP.—John D. Keller, Santa Clara, Cal., assignor of one-half interest to Otto Leu, same place. No. 570,643. Dated Nov. 3, 1896. This invention relates to that class of rotary pumps or engines in which readily slidable pistons revolving concentrically with the interior of the shell are operated by an eccentrically located cylinder or carrier which forms an abutment at one side with the interior of the shell, and a water or steam space on the other side. It consists essentially of a shell with rotating pistons operating concentrically therein, an eccentrically located cylinder or carrier through which the pistons operate, an abutment in the shell against the cylinder or carrier, said abutment having a downwardly extending back passage joining the water space within the shell and adapted to receive the sand and other foreign matters at the beginning of the abutment and dispose of them. A controllable discharge passage communicates with the base of the passage. Adjustable bearings are interposed between the pistons and the cylinder or carrier, these bearings having sockets and wearing plates in the sockets with springs by which they are controlled, wearing plates in the socket of the bearing plate of the cylinder or carrier and springs for holding them to contact with the opposing wearing plates in the oscillating bearings. The axle upon which the pistons are mounted is made hollow and has discharge holes through its interior to supply a lubricant to the bearings of the pistons, a tubular exteriorly threaded extension to the exterior of the shaft, a spring controlled valve, a communication between the cavity of the shaft and that of the tubular extension and an interiorly threaded nut provided with a plunger operating upon and in the tubular extension to force the lubricant into the cavity of the shaft upon which the pistons are mounted.

LETTER BOX.—Frederick G. Gaschlin, San Francisco, Cal., assignor of one-third interest to Jacob Mass, same place. No. 570,628. Dated Nov. 3, 1896. The object of this invention is to provide a letter or other box adapted to readily receive and dispose of the matter inserted and to close itself and so confine the matter disposed that it cannot under any circumstances be withdrawn or reached when the receiving aperture is open, the device forming an automatic safety letter box. It consists essentially of a letter or other receiving box comprising a casing with a receiving opening, a tilting receiver pivoted within the box having an open front adapted to be brought into alignment with the receiving opening of the box, a swinging guard plate adapted to cover and uncover said opening, a curved flange on the front end of the receiver adapted to temporarily cover the box opening preceding the alignment of the front of the receiver therewith and connections between the guard plate and the tilting receiver which bring the latter up into position to cause its open front to align with the opening and as the front guard plate covers the opening to turn the receiver downwardly within the box to discharge its contents.

WILL NEGOTIATE with owners or their duly authorized agents only.
WILL INVESTIGATE only thoroughly bona-fide properties, either Mines, Prospects or Mineral Lands, whose owners are willing to make reasonable terms. When sending reports on properties also send terms on which you are willing to sell or lease.

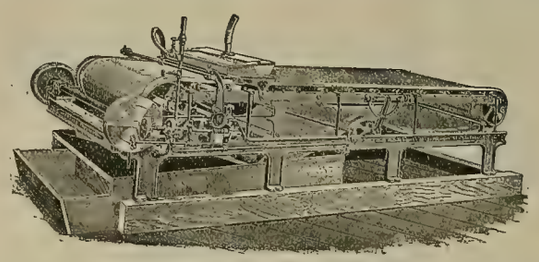
MINING AND MILLING MACHINERY.



"TRIUMPH" ORE CONCENTRATOR.

TELLURIDE, COLO., July 14, 1896.
Joshua Hendy Machine Works, San Francisco, Cal.—GENTLEMEN: Yours of recent date duly received. Regarding the "Triumph" Concentrator, we have eight 5-foot and eight 4-foot machines; they are giving perfect satisfaction. In addition to the above we have ten "Frue" Vanners. I am replacing these with your machines as fast as possible, as all our experiments show the "Triumph" to make a better saving, and their capacity is much greater in every respect. I consider the "Triumph" superior to anything of the kind we have ever used. Yours very truly, [SIGNED] N. T. MANSFIELD,
Gen. Supt. The Smuggler-Union Mining Company.

QUARTZ MOUNTAIN, TUOLUMNE CO., CAL., April 25, 1896.
Joshua Hendy Machine Works, San Francisco, Cal.—GENTLEMEN: Having carefully noted the operations of the "Triumph" Ore Concentrators you put in for the App mine, I am pleased to state, for your information and for such use as you may deem proper to make of this testimonial, that I am entirely satisfied with their operations, and especially the resultant high percentage of valuable concentrates which they save. Very truly yours, [SIGNED] FRED COOK, Supt. of App Mine.

PLACERVILLE, CAL., May 16, 1896.
Joshua Hendy Machine Works, San Francisco, Cal.—GENTLEMEN: The 5-foot "Improved Triumph" Concentrators we have at work in our Grand Victory mill are giving us the best of satisfaction. They do nice clean work, with very little attention, and do not easily get out of repair, and we are carrying to each of them at least 50 per cent more pulp than to our 4-foot Frue Vanners, in operation in the same mill. Our sulphurets are exceedingly fine and require very close concentration, and the "Triumph" seems to do it just about right, and should we add to our concentrating capacity we shall certainly use more "Triumphs." Very truly yours, [SIGNED] GRAND VICTORY GOLD MINING CO.,
Per H. E. Picket, Manager.

MINE BELL SIGNALS.
Adopted, Used and In Force in Accordance with State Law.
FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN legal size, 12x36 inches, the Mine Bell Signals and Rules provided for in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and rules, printed on cloth so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

RUPTURE CURED.
Dr. J. C. Anthony, of 86 and 87 Chronicle Building, who for the past four years has met with universal success in the cure of Ruptures, now guarantees a cure in from 10 to 16 days. There is no pain, no blood drawn and absolutely without danger. Usually but a single treatment required.

Improved Self-Contained Cushion-Frame Five-Stamp Mill.
Patented in the United States and Foreign Countries.

The Improved, Iron-Frame, Self-Contained, Cushion-Frame, Five-Stamp Mill Saves Bills for Heavy Timbers, Millwright and Mechanics' Labor, and a Large Amount of Space. The term "Setf-Contained" Means a Great Deal to the Mine Owner, and Can Be Readily Recognized and Appreciated in Making an Estimate For an Ordinary Five-Stamp Plant, When the Comparative Cost is Considered Over a Wood-Frame Mill.

FIRST: There is Saved by the Use of This Mill a Large Bill for Heavy Timbers, in Many Instances Obtained at Great Expense and Loss Of Time.

SECOND: The Saving in Mill-Wright and Mechanics' Labor in Framing and Erecting.

THIRD: The Large Amount of Space Saved.

Late improvements in the amalgamation and concentration of ores enable us to offer to the mining public, in connection with our Self-Contained Mills, an apparatus which amalgamates and concentrates at the same operation and provides a perfect trap for escaping quicksilver. Write to us for information.

Market Reports.

The Markets.

SAN FRANCISCO, Nov. 19, 1896.

General business has held up well. The continued high prices ruling for wheat and fair average prices for other farm products are important factors in promoting more prosperous times. The better informed operators in grain estimate that the advance in the market value of wheat within the past ninety days has benefited this State fully $2,000,000 and the coast fully $3,500,000. It is stated that while speculators were large gainers, still there were fully 75 per cent, if not more, of the farmers who were largely benefited. It is also reported that about all the surplus wheat has passed out of first hands and as the money circulates easier times are noted. In mining circles there continue more or less reports, seemingly from authentic sources, that the inquiry for gold properties is increasing and that 1897 will witness more activity than has ruled the current year. This will not be confined to California, but will extend to every gold mining district on the Pacific coast.

Continued growing ease is reported in financial circles, with very little, if any, friction met in securing accommodations. Money is also obtainable on realty which is making itself favorably felt in this direction. The validity of the Wright Irrigation law being established by the United States Supreme Court has done no little in promoting a better feeling in California securities which will cause Eastern and foreign money to be invested in them. Bonds which sold previous to the decision at 30 to 37½ cents, jumped to par so soon as the latter was made public. Mail advices from New York report as follows: The money market now reflects chiefly the anxiety of lenders to get money out, and most prominent among these lenders seem to be people who had no money at all to lend before election. Now they are only afraid that they will not be able to put it out at all. Those who did put money out before election succeeded in getting some very choice loans, as is always the case in times when money is hard to get. Everything in the market promises greater ease. A feature of importance in the local money market is the extent to which the money from hoards has gone into securities for investment. This takes stocks out of traders' hands and causes the paying off of loans on which these stocks were collateral, thus increasing the pressure of loanable funds. The supply of commercial paper is fair, but not large. Demand continues very good, with choice names moving at low rates.

New York Silver Prices.

NEW YORK, Nov. 19.—Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.
Friday	29 13-16	64¾
Saturday	29 13-16	64¾
Monday	29⅞	64⅞
Tuesday	30	65⅛
Wednesday	29⅞	65
Thursday	29⅞	65

	Copper.	Lead.	Iron.	Tin.
Friday	11 15	2 95	10 75@13 00	13 10
Saturday	11 20	2 92½	10 75@13 00	13 10
Monday	11 25	2 92½	11 00@13 00	13 15
Tuesday	11 30	2 90	11 00@13 00	13 15
Wednesday	11 35	2 90	11 00@13 00	13 15

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	7@8
Commercial Loans, prime	6@8
Call Loans, gilt edged	6@7
Call Loans, mixed securities	7@8
Mortgages, prime, taxes paid by lender	6@8
New York Sight Draft	5c Prem

London Bankers' 60 days	$4.83
London Merchants	$4.82½
London Sight Bankers	$4.86½
Refined Silver, per oz., 1000 fine	.65
Mexican Dollars	51½@52¼

SILVER—The market has strenghtened slightly. It is stated that the surplus supply in this country and Europe is light and with an improved call from any quarter prices would advance. If the usual December rains fall in India it is expected that a good demand will set in from there for crop purposes beginning next March. In our market there is a light call. The imports of bullion in October at this port aggregate about $237,000.

MEXICAN DOLLARS—The movement is light. The shipments from Mexico continue to go largely to the East for export.

QUICKSILVER.—There is a continued fairly free movement by sea and rail. The last steamer for Mexico took out 136 flasks. The receipts at this port in October aggregate 1151 flasks and exports by sea 680 flasks to Mexico and 100 flasks to Central America.

The market is quoted as follows:

Domestic trade, per flask	36 50

For export, quotations are nominal but less than for home.

COPPER.—The market has strengthened the past week in sympathy with the East and Europe. The consumption is steadily enlarging in this country and promises to be quite heavy before the winter and spring months pass. In Europe the consumption not only continues heavy but seems to be increasing which is gaining on the production. From present information it seems quite safe to predict still better prices at home and abroad.

Ingot, jobbing	14½@—
Ingot, wholesale	13½@—
Sheet copper	17 @—

LEAD.—The market is easier, but not quotably lower. The markets at the East and abroad are reported slower.

Our market is quoted as follows:

Pig	—	@	3 75
Bar	—	@	4 00
Sheet	—	@	5 25
Pipe	—	@	4 50

SHOT.—There is a good seasonable demand.

Drop, sizes smaller than B, per bag of 25 lbs	$1 20
Drop, B and larger sizes, " "	1 45
Buck, Balls and Chilled, do, " "	1 45

ANTIMONY.—Our market is quoted at 7¾@8½c in a jobbing way. New York mail advices quote 7¾@8c for Cookson's, 6½@7c for Hallett's and 6⅛@6½c for Japanese, from store.

BORAX.—The market is essentially unchanged.

The market is quoted as follows:

Refined, in car lots	6⅜
Refined, in sacks	5⅝
Powdered, in car lots	5¼
Concentrated, "	5⅝

TIN.—The market is quiet for both pig and plate. It is stated that the canners are feeling the market with the view of placing orders.

Pig, per lb	14¼c@ —
Plate, I C coke, heavy, per box	— @$4 05
" " light, "	— @ 3 95

IRON.—The market is stronger, with a disposition to ask more money, in sympathy with the East, where there is a strong growing demand. Large orders have been placed for rails and structural materials, which will call for liberal quantities of pig iron. On November 1 the number of furnaces in blast was 133, with a weekly capacity of 124,077 gross tons. For the first time since Dec. 1, 1895, the number of pig iron furnaces in blast shows an increase. Last December there were 242 furnaces in blast, while on October 1st last the number had fallen to 130, and the average weekly capacity had fallen in the same time from 216,797 tons to 112,782 tons. The number of coke and anthracite furnaces in blast November 1st was 112, with capacity of 119,094 tons per week, against 105 furnaces October 1st, with a capacity of 105,520, and 219 furnaces on Dec. 1, 1895, with a weekly capacity of 211,565.

LUMBER.—There is a continued good outward movement.

Redwood, Fluming	17 00	@	— —
Pine	14 00	@	19 00
Spruce	26 00	@	31 00

NAILS.—It is reported that there is some cutting in prices. Our Eastern advices indicate that the syndicate is not strong enough to stop cutting there and consequently lower prices are reasonably looked for. If reports are correct it looks as if the syndicate will go to pieces before the turn of next year.

The market is quoted as follows:

Wire, carloads, basis per keg	$3 20
" jobbing, " "	3 30
Cut, carloads, " "	2 95
" jobbing, " "	3 05

Mining Share Market.

SAN FRANCISCO, Nov. 19, 1896.

The action of the market begins to look as if it is being manipulated, but whether by a person in the interest of a combination of small pools or for moneyed men it is hard, as yet, to say. It is more than likely that the former have joined forces so as to take advantage of any favorable news that may be received from the work on the Brunswick lode. At this season of the year there is quite an influx of miners and others to San Francisco and neighboring points, and as they are possessed of more or less money there is quite a temptation to make a small deal in the share market to induce them to put in their savings. Aside from this it is a well established fact that money, aggregating a large sum, was withdrawn for safety from the banks before election which might also be invested for a turn or so in the market if the proper inducements were held out. Taking these factors for a deal and also reports that the banks are more disposed to favor borrowers in combination with the exploiting work on the Brunswick lode being of a favorable character and it ought not to cause surprise if the small pool combine should succeed in making a deal before long. Whether this will be done before or after a line of assessments has been levied it is hard to say.

Herman Zadig has returned from a visit to Virginia City and while there, it is said, he watched with considerable interest the work in two or more of the mines on the Brunswick lode. It is reported that he expresses himself as being well convinced that in Chollar, on the 400-foot level, the downward continuation of the ore found on the 300-foot level will not only be struck, but show quite an improvement over that on the level above. The work in Hale & Norcross, Savage, Gould & Curry, Best & Belcher and Con. Virginia is also attracting attention. There are mining men who claim that in one of the above named mines the good results will follow the work now under way. In Occidental the usual dead and exploiting work is the order with no essential change in the material encountered. It is stated that levels lower down will have to be opened and exploited before a body of ore of much importance is developed. In Chollar they are still working on the 300-foot level. On the 400-foot level the south drift is being run to make a crossdrift so as to strike the ore found above. It is stated that it will take from ten to fourteen days before they can reach the ore. In Hale & Norcross they are still extending the crossdrift on the 400-foot level. It is stated that almost any day they are liable to strike the downward continuation of the ore. In Savage they are working on the 300-foot and 400-foot levels. The formation of the material encountered on the latter level is said to be quite favorable. In Gould & Curry and Best & Belcher the exploiting work under way is being closely watched as it is pushed ahead. The crossdrift from the 300-foot station in shaft No. 2 is being pushed slowly ahead. They cut a streak of ore the past week which caused the shares to advance slightly only to sell down again.

From the Comstock lode the news, taken as a whole, is not of a character to create interest, although in several the work is still being pushed in the right direction, yet this can be turned or else stopped at any time. From the general tenor of advices, it seems to be settled not to show up the west or Red lode, which is known to be largely gold-bearing, with three or four of which said to assay quite high. The official letter from Alta reports that in the east drift on the 725-foot level they are in favorable formation. The south drift on the 815-foot level is in quartz, a stringer of which assays over $34 per ton. From Overman nothing new has come to hand. The Seg. Belcher letter reports that a few tons of ore is raised—more than enough to pay current expenses, for it is mostly gold-bearing. No particulars are given as to the work that is being done. The last letter from Belcher reports nine miners at work against seventy-eight the week before. Ore is being raised, while over 330 tons have been sent to the mill for reduction. The letters from Challenge, Confidence and Con. Imperial are a virtual repetition of those that have come to hand the past few weeks. In Alpha the work appears to be not to strike the west lode, owing, it is reported, to there being too many shares out. The work in Bullion is on the same level and direction reported last week. In Potosi and Chollar exploiting work is continued on the levels heretofore published. Some ore is extracted and raised. In Hale & Norcross no change is reported in the work or material encountered. Active exploiting work is reported in Savage, but nothing so far of an encouraging character. The joint east crossdrift run by Best & Belcher and Gould & Curry from the Bonner shaft is being pushed slowly ahead. The official letter from Con. Virginia reports that some timbers caught fire on the twenty-seventh floor of the 1750-foot level, but were blockaded so as not to interfere with the work. The work on the 1650-foot and 1000-foot levels ought to be soon advanced far enough as to have an important bearing on the shares. The work that is being done in Ophir and Mexican, to the west, is well thought of by mining men. The official letters from Union, Sierra Nevada, Utah and Andes do not report anything new as to the work or material encountered.

The market opened weak and inactive this morning. After call there was a decline in Chollar and Con. Virginia, which caused the entire list to sell lower. Towards noon Chollar strengthened to $1.70 bid, causing a steadier feeling. There seems to be a general impression that the Chollar workings on the Brunswick lode are a failure and will prove another Occidental. While this appears to be the prevailing opinion yet with mining men who have visited the lode, the belief prevails that it is quite far from a failure and that the outlook is altogether hopeful. On the 800-foot level they have made preparations to raise on a 2-foot vein of ore running from $40 upwards per ton, mostly gold, for the purpose of extracting and milling the ore. From all we can learn, they have in sight a very large quantity, which can be made to pay quite well, even if it mills $20 coin value. The vein extends up to the 200-foot level and, it is said, down to the 400-foot level. If this is so, then there are several thousand tons in sight. Official letters filed from the Potosi superintendent report they are extracting ore from the 80-foot level, west croppings, which assays, coin value, $14.35 per ton. This will pay quite well. Chollar extracted 104 tons of ore, coin value $15 per ton. Hale & Norcross milled the past week 134 tons of ore, which yielded $3414.12 gold and 3255 88-100 ounces fine of silver. The average wagon sample assay was $25 gold and 30 ounces silver. The battery assay was $19 gold and 27⅞ ounces silver. The percentage obtained of the wagon sample was 89 and of battery assay 104 3-10. It will be seen by the above that the battery assay of the 134 tons was $19 per ton gold. As the United States Mint at Carson returned to the company $3414.12 in gold, it necessarily follows that the battery assay is a delusion and a snare as far as the gold is concerned, for the ore returned in gold coin $25.48 per ton.

The following illustrates the changes of the week:

BANKERS and BROKERS,

No. 1630 Stout Street.

Telephone 1293.

DENVER, COLO.

STOCKS, BONDS, GRAIN AND PROVISIONS.

Direct private wires to Chicago, New York, Cripple Creek, Colorado Springs and Pueblo.

Orders executed in large or small amounts for cash or on *reasonable* margins. Out-of-town orders by mail, telephone or telegraph will receive prompt attention. Daily market circular mailed free on application.

Recent California Mining Incorporations.

Randolph Gold Gravel Mining Company, Grass Valley. J. Glasson, J. R. Thomas, G. Griffin, A. Howell, R. Eddy. Capital stock, $20,000, all subscribed.

Anchor Mining Company, San Francisco; capital stock, $25,000 all subscribed; H. F. Fortmann, W. A. Frederick, C. Hirsch, H. A. Williams, N. J. Coleman.

Rockland Gold Mining Company, San Francisco. F. X. Simon, G. F. Davidson, J. Rosenthal, T. Fox; E. D. Farish. Capital stock, $500,000, $125 subscribed.

Visalia Mining and Milling Company, Visalia. A. Shonero, E. Downing, R. L. Underhill, J. A. Pendergrass, Visalia; C. B. Simmons, Exeter. Capital stock, $90,000, all subscribed.

San Andreas Mining Company, San Francisco. J. D. French, Oakland; W. Forsyth, Fresno; B. H. Ramsdell, Alameda; H. G. Platt, M. Fleishaker, San Francisco. Capital stock, $300,000, all subscribed.

Great Bear Mining and Development Company, San Francisco. G. E. Ellis, A. Hoffschneider, H. L. Norton, Oakland; W. H. Hansen, Alameda; A. W. Delafield, East Oakland; C. K. Garrison, Fruitvale; H. O. Eifert, San Francisco. Capital stock, $150,000, $3,500 subscribed.

Recently Declared Mining Dividends.

Swansea, Utah, $5000; payable Nov. 25th.

Golden Fleece, Colorado, $6,000, payable Nov. 20.

Centennial-Eureka, Utah, $30,000; payable Nov. 14th. The total to date is $1,890,000.

Starr King Mining Company, $37,500; payable November 16th. Total sum paid since organization, $825,000.

Galena, Utah, $5000; payable Nov. 20th. The total to date is $61,000, of which $55,000 has been paid this year.

Bullion-Beck, Utah, $30,000; payable Nov. 20th. The total to date is $1,902,000, of which $245,000 has been paid this year.

Elkton, Colorado, $20,000, payable Nov. 20. This company has been paying regular monthly dividends of $10,000 for several months. There is at present a reserve fund of $150,000 in the treasury.

Calumet and Hecla Mining Company, of $5 per share, payable Dec. 17, to stockholders on record Nov. 19: the fourth dividend declared during the fiscal year and the fifth for the calendar year, or $25 per share, bringing the aggregate disbursements by the company up to $46,750,000.

Commercial Paragraphs.

THE Parke & Lacy Co., 21 & 23 Fremont St., are sending out a good many Ropp straight-line furnaces to leading concerns, and are about building several on a Mexican order.

A CONTRACT for twenty-five air compressors and twenty-five air receivers, of medium and small sizes, has been closed by the Clayton Air Compressor Works, Havemeyer Building, New York, with one company, delivery of the entire order to be made within six months from date. They also report sales of five air compressors of standard pattern during the first week in November. The indications point to a decided revival of trade in air compressors.

FRASER & CHALMERS of Chicago have an order from Honolulu for pumping engines for the Ewa plantation: Two pumps each of a capacity of 10,000,000 gallons in 23 (not 24) hours—one, a duplex double-acting Riedler pump, plungers 14½ inches diameter by 42 inches stroke, driven by a horizontal cross-compound condensing Corliss engine, steam cylinders 24 and 38 inches diameter by 42 inches stroke, capacity 7225 gallons per minute against a head of 197 feet, when running about 70 revolutions per minute. The other pump is similar except that the head will be 120 feet, pump plungers 15¾ inches diameter and steam cylinders 20 and 32 inches diameter respectively.

Every Inventor Wants a Good Patent

Or none at all. To secure the best patents Inventors have only to address DEWEY & Co., Pioneer Patent Agents, No. 220 Market St., San Francisco.

There are many good reasons why Pacific Coast Inventors should patronize this Home Agency.

It is the ablest, largest, best, most convenient, economical and speedy for all Pacific Coast patrons.

It is the oldest on this side of the American continent, most experienced, and in every way reliable.

Conducted from 1863 by its present owners (A. T. Dewey, W. B. Ewer and Geo. H. Strong), this agency has the best knowledge of patents already issued and of the state of the arts in all lines of inventions most common on this coast.

Patents secured in the United States, Canada, Mexico, all British colonies and provinces, England and other civilized countries throughout the globe.

Caveats filed, assignments duly prepared, examinations made, and a general Patent Agency business conducted.

Established and successfully and popularly conducted for nearly thirty years, our patrons number many thousands, to whom we refer with confidence, as men of influence and reliability. Old and new inventors are cordially offered the complimentary use of our library and free advice, etc. No other agency can afford Pacific States inventors half the advantages possessed by this old, well-tried and experienced firm.

"HISTORY OF CRIPPLE CREEK."

We have just issued in book form the only authentic and reliable history of Cripple Creek gold camp, the marvel of the mining world. The book contains numerous full-page illustrations (with map) of gold mines true to life. With the sole object of introducing our big 8-page 56-column illustrated weekly paper (established 1859) we will send a copy of the above interesting book free to all who send us 25c (stamps or silver), for a 3 months' (13 weeks) trial subscription to our big weekly, which contains the latest mining news and illustrations of Rocky mountain scenery. Club of 5 and 5 books, $1. Mention THE PRESS and address, *Illustrated Weekly*, Denver, Colo.

THE OVERLAND LIMITED, VIA UNION PACIFIC.

Only 3 1-2 Days to Chicago-----3 1-2.
Only 4 1-2 Days to New York---4 1-2.

The Union Pacific is the only line running Pullman double Drawing-Room sleepers and Dining Cars San Francisco to Chicago daily without change. Only one change to New York; dining car service entire distance. Vestibuled composite buffet smoking and library cars between Ogden and Chicago.

The only line running upholstered Pullman Tourist sleepers San Francisco to Chicago daily without change, and personally conducted excursions to St. Paul and Chicago without change, leaving San Francisco every Friday.

Tickets and sleeping-car reservations at No. 1 Montgomery St. Steamship tickets on sale to and from all points in Europe. D. W. HITCHCOCK, General Agent, San Francisco.

Assessment Notices.

THORPE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Calaveras County, California.

Notice is hereby given that at a meeting of the Board of Directors held on the 14th day of October, 1896, an assessment (No. 4) of five (5c) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, No. 507 Market street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 12th day of December, 1896, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on SATURDAY, the 9th day of January, 1897, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

A. F. FREY, Secretary.

Office—No 507 Market street, San Francisco, Cal.

GREENWOOD GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Greenwood, El Dorado County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 16th day of October, 1896, an assessment (No. 1) of two (2c) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 79, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 23rd day of November, 1896, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 14th day of December, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHAS. R. ELLIOT, Secretary.

Office—Room No. 79, Nevada Block, No. 309 Montgomery street, San Francisco, California.

GOLD RIDGE CONSOLIDATED MINING AND MILLING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Nevada and Sierra Counties, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 20th day of October, 1896, an assessment (No. 5) of two and one-half (2½c) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Rooms 12 and 13, No. 43 Sixth street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 21st day of November, 1896, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 14th day of December, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

WM. F. McLAUGHLIN, Secretary.

Office—Rooms 12 and 13, No. 43 Sixth street, San Francisco, California.

THE CALIFORNIA DEBRIS COMMISSION HAVing received applications to mine by the hydraulic process from Edgar Mayhone, in the Gould Mountain Mining Company, Fair Play, El Dorado county, to deposit tailings in Spanish creek; from Nickelson & Williams, in the Crawford diggings, near Camptonville, Yuba county, to deposit tailings in Bridger creek; from McDonald & Hoffman, in the Gilbert mine, near Yankee Jim's, Placer county, to deposit tailings in Devil's canyon; and from the Oregon Gold Mining Company, in the Forty-nine mine, near Enterprise, Butte county, to deposit tailings in a ravine, gives notice that a meeting will be held at room 59, Flood building, San Francisco, Cal., on December 7th, 1896, at 1:30 P. M.

WANTED,

A position as Superintendent or Assistant Superintendent in copper-silver or silver-lead smelting works.

Understands mining, sampling, assaying, furnace management, handling men.

Prefer Mexico or Spanish South America. Speaks Spanish. Best references.

Address METALLURGIST, this office.

A Thoroughly Competent and Experienced Millwright, Engineer and Machinist,

And who is a **Competent Bookkeeper and Surveyor**, seeks a position in a mine as superintendent or otherwise. Expert in mineralogy and assays.

THIRD EDITION JUST OUT.

Assaying Gold

.....AND.....

Silver Ores.

By C. H. AARON.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores,") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:—Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 126 12-mo pages, with illustrations, well bound in cloth; 1896. Price **$1.00** postpaid. Sold by the **Mining and Scientific Press**, 220 Market St., San Francisco.

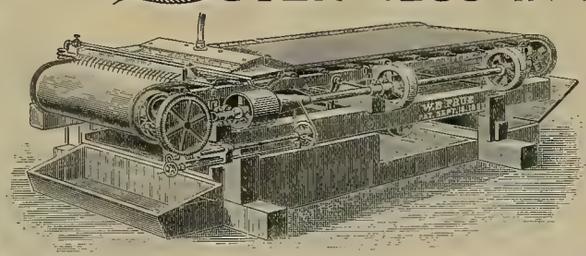
FRUE ORE CONCENTRATOR.

OVER 4200 IN ACTUAL USE.

Manufactured under Patents of
April 27, 1880;
September 18, 1883;
July 24, 1888;
March 31, 1891.
July 18, 1893.



It can be safely stated, without going into a description of several new and untried concentrators that have lately come into the market, that where sulphurets are of such value as to make close saving necessary, the Frue Vanner is always used. It is the only endless belt concentrator in the market that can be relied on to handle all classes of ores, and give universal satisfaction. (In all competition of concentrators the Frue Vanner is taken as the standard machine of the world and all comparisons made by it. There have been over 4200 of these machines sold, 1700 having been sold on the Pacific coast alone.) They are in use in every part of the world where mining is carried on and in all cases they are giving perfect satisfaction. From time to time valuable and important improvements have been made in this machine to increase its capacity and durability, and particular attention is called to the Patent Lip Flange for the rubber belt, which does away with nearly all the strain and cracking, as in the old style of flange, making the life of belt more than double that of other style belts in the market. The lip of flange bends outward in going over the large end rolls, thereby distributing the strain in the solid rubber, and bringing virtually no strain either at the edge or at the base of flange, as is the case in all belts with a raised edge.

For any information, pamphlets, circulars or testimonials, call on or address

Will Mining Decline?

Many of those who have taken part in the mining booms in the past quarter of a century predict that in two or three years the present activity in that industry will cease, and that we shall return to the condition of five years ago, when it was hard to induce capital to consider any offer of investment in that direction. It must be remembered, however, that the conditions have changed entirely. The industry was then carried on by a very different class of men from those who are now taking the lead. As conservative men are now going into mining as into banking and other mercantile pursuits, or manufacturing, or agriculture. They are not going in for the purpose of speculating, but for the larger legitimate profits that the industry promises.

The chief reason for this is the fact that with improved methods and better knowledge of how the industry should be conducted there need be little more risk in mining, provided as much care is taken, than in buying into any well-established business.

With the passing away of speculative mining there are disappearing some elements that can well be spared. One evil that has had its day is the unscrupulous promoter who bonds worthless mines and expects with the aid of an expert with a name to sell them for large sums. Much is to be said for the honest promoter. He is a necessity and does much good in bringing together the capitalist and the mine owner who is without money.

Twenty-five years ago the charges of experts for examining mines were very small compared with what they are now. The reason for this was that the country was overrun with men of ability, but without scruples, who expected, to say the least, better fees for good reports than bad. These men have been weeded out and can do no business. The result is that those who have withstood the test receive princely fees, paid as much for their reputation for integrity as for their ability. Often upon the report of one of these alone millions are invested without question. Curiously, there is a prejudice among many miners against the expert, and yet he is the best friend they have. He has killed more swindles and caused the opening up of more good mines than any other class of miners. He has done more than any one else to discourage the dishonest promoter.

The business of mining the precious metals is being built up on conservative lines, and the present activity is not a passing furore. The reduction in the cost of mining and milling has so widened the field that ten mines may be worked at a profit to-day to one twenty years ago.

ROUSE COAL MINE, COLORADO. (See page 444.)

In about ten years from the time of the discovery of gold in West Australia the population has increased from about 30,000 to over 100,000, and the revenues of the colonial government have grown from about £250,000 to £863,680, the amount returned for 1895. A scarcity of water has been a great drawback and a large proportion of the gold mined has been lost in the use of dry processes. To remedy this in the future the government has under consideration a scheme for pumping water from the Darling river to a reservoir on top of Mount Burgess, at a cost of £2,500,000.

For many years tales have been told of great mineral wealth within the borders of the Navajo reservation, in northwestern New Mexico. According to these the Navajos used gold for making bullets, and among other things there was a "mountain of gold." A few months ago some Colorado mining men, with the consent of the chief of the Navajos, explored the country and they report that they found nothing to justify any of the old tales.

MINING AND SCIENTIFIC PRESS.

ESTABLISHED 1860.

Oldest Mining Journal on the American Continent.

Office, No. 220 Market Street, Northeast Corner Front, San Francisco.
Take the Elevator, No. 12 Front Street.

ANNUAL SUBSCRIPTION:

United States, Mexico and Canada.....$3 00
All Other Countries in the Postal Union..... 4 00

Entered at the S. F. Postoffice as second-class mail matter.

Our latest forms go to press on Thursday evening.

J. F. HALLORAN.....General Manager

San Francisco, November 28, 1896.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Rouse Electric Pumping Plant—150 H. P. Direct Coupled Engine and Generator, with Condenser; Rouse Coal Mine, Colorado, 437. Triple Discharge Two-Stamp Gold Quartz Mill; Naphtha Launch, 443.

EDITORIAL.—Will Mining Decline? Great Increase in West Australia; Mineral Wealth in New Mexico, 437. Salting; The Government's Mining Bureau; Low Grade Mines; Director Walcott and the Geological Survey; Railroads, Electricity and Mine Development; The Value of the Gravel Mines, 438.

MECHANICAL PROGRESS.—Gun Metal and Bronzes; Triple Discharge Two Stamp Gold Quartz Mill; Simplex Naphtha Launch Engine, 443.

SCIENTIFIC PROGRESS.—The Phenomena of Rain; Horseless Carriages, 443. The Light of the Starry Sky; The Value of the Future, 444.

ELECTRICAL PROGRESS.—Electricity vs. Compressed Air; Interesting System of Electric Tramways in Genoa; Air Compressing Devices; Disappear in the Electric Furnace, 444.

PRACTICAL INFORMATION.—Briquettes from Culm Heaps; Population Living in Cities of the United States; Iron Bar 2000 Years Old; Domestic Tin Industry; To Unite New York and Philadelphia by a Ship Canal; Training Locomotives, 444.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 446-7.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 454.

MISCELLANEOUS.—Concentrates, 439. A Few Points for Prospectors; The New University; Elevators of the Golden Feather Company, Butte Co., 440. The Cyanide Process; Turquoise Mining, 441. Laboratory Tests in Connection with the Extraction of Gold from Ores by the Cyanide Process; Africa's Condition, 442. Coast Industrial Notes; Personal; Obituary; Books Received, 445. List of U. S. Patents for Pacific Coast Inventors: Notices of Recent Patents, 448. Recent California Mining Incorporations; Recently Declared Mining Dividends; Commercial Paragraphs, 455.

The Government's Mining Bureau.

The Los Angeles *Times*, in speaking of the proposal to establish a Secretaryship of Mines and Mining, says: "Just at present the Federal Mining Bureau is a portion of the Department of the Interior, and should remain so for a year or two longer, till some better reason than has yet been given can be adduced for the enlargement of the Cabinet or the multiplication of its functions."

None of those who have had business in Washington in connection with mining matters have ever been informed of the presence there of a Mining Bureau. There are bureaus almost without limit, but none of mining. There is not even a single clerk in any one of the departments whose business is in connection with mining matters. Mining is practically unknown to the Government officially.

Railroads, Electricity and Mine Development.

In Colorado it is a very poor mining camp that does not have at least two railroad connections with the outside world. In California even a single railroad approaches very few of the mines. To be sure, owing to the larger proportion of free-milling ore that can be worked on the ground, railroads are not so much of a necessity in this State. However, railroads could do a great deal for the mining industry in the Sierras. A difference of a few cents in the cost of supplies will in many places change loss into profit and mean the working of many thousands of tons of ore near the margin.

Better means of transportation and the development of the resources for power by the use of electricity will do much for mining in this State within the next few years. A company has been formed to build a road from Stockton into Amador and Calaveras counties and a number of companies have been formed in different parts of the State to supply electric power to the mines. One of these has contracted to deliver power to certain mines in Calaveras by May 1, 1897.

One of the greatest advantages that will come from the building of these electric plants will be the fact that an impetus will be given to prospecting and development work. Hundreds of owners of undeveloped mines, who cannot afford or do not care to risk the cost of independent power plants, would gladly avail themselves of the opportunities thus offered for getting enough power at a small proportion of what such plants would cost to prove their properties.

Director Walcott and the Geological Survey.

We are in receipt of a letter from Director Walcott of the U. S. Geological Survey that should be of considerable interest to mining men, in that it shows the Director's friendly attitude toward the mining industry and explains why all that is desired cannot at present be accomplished. It is as follows:

DEPARTMENT OF THE INTERIOR.
UNITED STATES GEOLOGICAL SURVEY.
WASHINGTON, D. C., Nov. 16, 1896.

TO THE EDITOR:—I have just read the editorial contained in your issue of November 7th on the Geological Survey and Mining and also Mr. Mark B. Kerr's letter on the Geological Surveys of the Gold Belt of California, and I fully appreciate the position that you take with respect to the desirability of pressing forward the surveys in the State in question.

While I was in the act of reading the editorial the first copy of the Nevada City Special Folio of the Geologic Atlas was laid upon my desk, a copy of which folio will be sent to you by mail. The field work pertaining to this folio was completed last year and the publication of the folio was taken up as soon as the author had completed his maps and text. It is not practicable to survey the entire area of the Gold Belt with the same detail, on account of the great expense that would be incurred. If the appropriations annually made for topographic surveys in the United States were divided proportionately among the several States there would be less than $4000 to be expended in each State; and the annual appropriation for geologic work is considerably less than that for topographic work. There is scarcely a State in the Union that has not mineral or other resources that require the benefits of topographic and geologic surveys. However, with the coming of more prosperous times, it may be that the appropriations for the prosecution of the work of the Geological Survey will be increased and, if so, the work in California will be correspondingly benefited, at least so far as the matter rests with me. Some of the States have co-operated with the National Survey in the topographic mapping of their areas, and in such States the surveys have advanced with much greater rapidity. Other States have local geologic survey bureaus that look after the local economic problems, which the National Survey necessarily does not investigate. Our aim is to prepare topographic and geologic maps upon which the local geologist, mining engineer and civil engineer may base their work. This is the general plan of procedure, though a few of the great mining centers are studied in detail in the course of our work, with a view to furnishing guides to the development of districts of a similar character. An example of this is shown in the Nevada City Special Folio.

During the season just closing two topographic sheets have been completed in the vicinity of San Francisco, and also a one-thousand mile sheet lying north of the Yosemite sheet in the Sierra. In addition to this, areal geologic work has been carried forward by Mr. Turner in the gold belt, and by Prof. J. C. Branner, of Stanford University, and Prof. Andrew C. Lawson, of the University of California, in the vicinity of San Francisco.

Yours with respect,
CHAS D. WALCOTT,
Director.

No better arguments in favor of a systematic geological survey on the part of the State as suggested by the State Mineralogist could be presented than appear in Mr. Walcott's letter. With such a survey established much of the work already done by the U. S. Survey would become of great practical value, where it is now like the framework of a building that needs finishing. But some plan must be adopted by which the work may be undertaken and carried out upon a system that will give assurance of reliable results. If there is to be a change of geologists with each new administration in this State we may not expect satisfactory work, for good men cannot be retained under such circumstances. The Mining Bureau has done good work in the past, but could have done much better had it not been in the power of every new Governor to change its personnel. Probably a good plan would be to have the directors of the Mining Bureau appointed for long terms, and hold them responsible for their employes. This is the way in which the University is managed, and it is by far the best managed of all our public institutions.

With such a governing body free from political influence the offices of the Geological Survey would be economically administered. Free from political "pulls," they could choose the best men to be obtained. In this connection it might be suggested that much of the work could be done by young graduates of the State University, most of whom would be glad to serve for nominal salaries. In this way a small appropriation might be made to do much work.

The Value of the Gravel Mines.

The early rains have been the cause of opening up a great many of the smaller hydraulic gravel mines especially in Siskiyou and Trinity counties where the debris question does not interfere. Those counties and southern Oregon will illustrate the value of hydraulic mining to the country. In 1895, Trinity was the fifth county in the State in the amount of gold produced with $1,305,412 to her credit, nearly a million of which came from gravel mines. The product from Siskiyou was $1,030,983 largely from gravel. In southern Oregon there have been so many new hydraulic mines fitted up for the coming season's run that the yield of the State will be very largely increased.

Placer county was the second in the list in 1894 and third in 1896, and a large part of her gold comes from placers—mostly, however, drift mines. It has been claimed by the anti-debris people that because the output of gold in Placer is so large, the closing of the hydraulic mines was not so great an evil after all. But they do not seem to understand that this large yield of gold comes not from the mines which were being worked by the hydraulic process, but mainly from the gravel, capped by deep lava, that would never have been worked in that way. Much of the gravel that is suitable for hydraulicking will not pay to drift, and, unless hydraulicking is resumed, will never be worked.

At the time of the debris fight great advances were beginning to be made in drift mining, and the closing down of the hydraulic mines had little to do with encouraging this drift mining except through forcing the hydraulic miners to seek new pursuits. Many went into drift or quartz mining, and so gave an impetus to those industries. In other counties where there had been considerable hydraulic mining the yield of gold fell off much more than in Placer, because there was no suitable gravel for drifting.

Low Grade Mines.

The so-called played out mining camp in this State is still the best field for mining. Many new districts have been opened up, but few of them hold out well. In the old camps that were worked in early days, and later comparatively deserted, the greatest proportion of the big mines of this State are to be found to-day. Many suppose that this is owing entirely to the discovery of new ore bodies. In a measure this is quite true, but the main reason is that with the reduced cost of mining and milling old and well-known ore bodies that would not pay a few years ago now yield large profits.

The proportion of the ore found years ago that would then pay to work was so small that the average life of the mining camps was short, and many, in view of their experience of earlier days, expect mining to "peter" out again soon. This probably leads many to sell out sooner than they would if they believed the present more than a passing excitement. A low-grade mine that is just too low grade to pay to work now is considered worthless. Yet far-sighted men might make worse speculations than to at least pay taxes on many of these, and wait for the time when, with further reductions in the cost of working, they may become valuable.

Salting.

It is very seldom that one hears now of cases of "salting" of mines in this State. No case of any large swindle perpetrated in this way has been recorded for several years. It is almost impossible, of course, to successfully salt a mine that is to be examined by one who has a good knowledge of sampling. In many of the cases in which swindles were perpetrated in this way years ago, the mines were examined and sampled by experts of known ability. There could only be one conclusion as to the cause, and that is that there was collusion between the expert and the seller. But that class of expert has had his day. Purchasers of mines now who rely upon the judgment of others have learned to know the men they are to rely on first.

Concentrates.

A NEW smelter is to be built at Vancouver, B. C.

THERE are five cyanide plants at Bodie working on old tailings.

MICA beds have been located on the Slocan river, in British Columbia.

A COLORADO firm proposes to erect sampling works at Spokane, Wash.

THE average value of Johannesburg, South Africa, gold is $16.50 per ounce.

BY the new stage line it is twenty-six miles from Kramer to Randsburg, Cal.

THE old experiment of a dry concentrator is to be tried in Lake City, Colorado.

THE Kentuck mine, Nevada, Cal., is about to be reopened after many idle years.

A TIN deposit is reported to have been discovered on Home creek in British Columbia.

A CUSTOM MILL is to be erected in the Deep Creek district in Utah for handling gold ores.

CINNABAR has been discovered in the main shaft of the Great Coolgardie Proprietary Blocks.

SEVENTY-SEVEN mining locations were recorded at Bakersfield, Cal., in the month of October.

BRITISH COLUMBIA miners think it is time for that province to have a B. C. Miners' Association.

MINING companies continue incorporating in the State of Washington at the rate of ten a day.

SOME mining locations have lately been made in the business part of the city of Spokane, Wash.

REPORTS of the sale of the Champion mine at Nevada City, Cal., are denied by Superintendent Fred Zeitler.

THE heavy rain and snow fall in the mountains insures plenty of water for the season's work in this State.

W. S. STRATTON says he will spend $100,000, if necessary, to bring Cripple Creek ore and plate thieves to justice.

THE new owners of the Alameda mine, near the Rawhide, in Tuolumne county, have decided to erect a 40-stamp mill.

AT Mercur, Utah, several of the big properties are being considered with a view to purchase by European capitalists.

AN electric road from Colorado Springs to Cripple Creek and Victor is to be built. It will be thirty-one miles in length and cost about $300,000.

LA FORTUNA MINING COMPANY of Arizona shipped lately a single bar of bullion to San Francisco valued at $92,535, the result of thirty days' run.

IN THE newly discovered gold mines at Russell, Kansas, it is claimed that ore that runs as high as $100 a ton has been developed in paying quantities.

THE recent indorsement of the good roads movement by the California State Miners' Association is meeting with affirmative echo all over the State.

THE founding of a School of Mines in Salt Lake, Utah, is being agitated, and it is proposed to ask the State Legislature to make an appropriation.

THE Mount Bischoff tin mine of Tasmania has produced 48,508 tons of tin ore of a value of £2,640,000, and has paid dividends amounting to £1,419,000.

IT is reported that August F. Heinze will soon erect a lead smelting plant with a capacity sufficient to treat all of the silver-lead ores in the Kootenay, B. C.

ON Texada island, near Vancouver, B. C., a cave has been found in which the floors are said to be of fine sand carrying fine gold and the walls of gold-bearing quartz.

THE output of the mines at Rossland, B. C., during the month of October exceeded that of any month to date. The total value of the output amounted to over $175,000.

A LARGE quantity of hydraulic machinery is being put in at different points in Jackson and Josephine counties, Oregon, and the mining season will be a brisker one than ever.

OWING to the large increase of business in the Kootenay country in British Columbia, the Canadian Pacific Railway has made a new division with headquarters at Nelson.

THE increase in the number of voters since 1892 has been far larger in Spokane than in the other cities of Washington. This is due to the development of mining about that place.

THE population of Cripple Creek is increasing. A proposed annexation of outlying districts, the Cripple Creek *Mail* claims, would, if carried out, give a population of 18,000 to 20,000.

THE Tortillata Gold Mining Company has been organized, under the laws of Wyoming, for the purpose of working the auriferous gravels in the Sacramento river above Keswick, Shasta county, with dredgers.

THE Bank of British Columbia has opened a branch at Sandon, B. C. There are two railways running to the town, and it is thronged with people. Owing to the small available building area the price of land is rapidly going up.

OF the Cripple Creek output, the October production gives a total of 16,000 tons, of which 7000 went to the mills, with an average value of $30 a ton. The remaining 9000 was of smelting grade, with an estimated average value of $75.

EVERY holder of an unpatented mining claim should see to it that claim jumpers will find scanty picking on Jan. 1st, '97. But 34 days remain in which, if not already done, the $100 worth of work or improvements for '96 can be performed.

JUDGE CATLIN of Sacramento has issued a writ of mandate to the California State Controller compelling him to pay the withheld salary of R. I. Thomas, as secretary of the State Debris Commission, from January to June, 1896, amounting to $750.

PROSPECTORS' classes in mining centers have been adopted in Ontario under the direction of the Government, and the policy of placing mineral collections of a mixed economic and scientific character in localities where mining and prospecting are carried on has also been adopted. The Provincial Government has caused lectures to be given in Victoria, Vancouver, New Westminster and Nanaimo.

IN view of the recent cyanide patent decision in the Transvaal, S. A., the compilation on page 441 of this issue is particularly timely, being a compilation up to date of references to recent literature on the subject of the cyanide process in general.

THE good work being done by the Northwest Mining Association, which is composed of members from British Columbia as well as from the northwest mining States, has caused the suggestion of the formation of a British Columbia Mining Association.

NEWSPAPERS in the mining counties of this and other States are interviewing the most prominent residents of their respective localities regarding their views on the proposed cabinet office of Secretary of Mines and Mining. The replies are almost unanimously in favor of the idea.

CHAS. G. YALE, statistician of the U. S. Mint, has compiled a review of the gold production of this State from 1848 to 1895, inclusive, figuring an aggregate of $1,265,217,217. This enormous amount is but an index, a surface indication of the amount of gold yet to be mined in California.

THE suggestion of the Leadville, Colorado, Miners' Union for a sympathetic strike, tying up all mines in the State, and similar action throughout Montana, does not meet with favorable response, the general idea being that it would be folly to further extend the present trouble at Leadville.

NAMES are already being suggested for the proposed position of Secretary of Mines in the President's cabinet. It is very premature. The name of the probable incumbent is the last thing to consider. A vast amount of work is necessary before the consideration of any name is of any avail.

THE production of copper in Japan is increasing. The exports in 1895 were 6500 tons, 7100 tons in 1894 and 7000 tons in 1893. The decrease in exports in 1895 was partly due to the smaller shipments to China and partly to the large demand at home, chiefly for use in manufacturing war material.

IT is officially announced at Duluth, Minn., that the Rockefeller Iron Syndicate has sold $500,000 worth of Minnesota ore, to be delivered next season, and 60,000 tons of Spanish-American ore. This will enable the underground mines on the Mesaba range to resume operations at once and will give employment to thousands of men.

A MEETING was held in Rawlins, Wyoming, last week to form a mining exchange. The late discoveries at Grand Encampment and at other districts in the neighborhood make the city the center of considerable mining activity. The question of improved roads to various mining camps tributary to Rawlins was discussed at the meeting.

ONE result of the election is the publication of predictions of mining booms in the gold districts. In Colorado this is especially noticeable, and the sale of the Tom Boy to the Exploration Company and the presence in that State of a number of representatives of European capital have had much to do with increasing activity in the gold districts.

A. H. LACY and A. R. Bryson of Los Angeles, Cal., have a $100,000 bond on the Barenos gold property at San Francisquito, Lower California, 350 miles south of San Diego, on the gulf coast of the peninsula. The property is said to be sufficiently valuable in quantity and quality to justify placing schooners on the gulf and building a road to the shore line.

THE results of close competition in some lines of business is illustrated by the report of the Giant Powder Company at its annual meeting last Wednesday, when it was shown that during the year 7,000,000 pounds of powder had been made, on which the profit was $1700. In the face of such meager profits it would look as if competition may give place to consolidation.

IT IS reported from London that Captain De Lamar has given to an English syndicate an option on the De Lamar mine in Lincoln county, Nevada, but this is denied at the company's headquarters at Salt Lake. It is claimed that the income from this property amounts to about $2,000,000 per annum. Usually the annual reports of the sale of this mine come earlier in the season.

THE three mills of Deadwood, South Dakota, are treating 500 tons of siliceous ore per day, an increase of 100 per cent within a year. According to the Black Hills *Times* these ores will average $20 per ton, which is a low estimate, making the product $300,000 a month and over three and a half millions of dollars a year, which is greater than that of the Homestake and associate properties.

AIRSHIPS have been seen in the Sacramento sky, and during the next thirty days the chicken in Josephine Co., Oregon, with $1.38 in coarse grain gold in its crop, and the hemlock roots in Skagit, Wash., yielding visible gold in their ashes, should be heard from. All three stories were due November 15th. The Yuma, Arizona, white gold that sells for $24 per ounce is very late in reporting this year.

IT IS proposed to bring forward a bill at the next session of the Legislature to prevent aliens from locating mineral land in British Columbia. The British Columbia *Mining Record* says of this: "The aliens have hitherto located ground in British Columbia and enriched the province by many millions of dollars. They have spent their labor and experience in the country, and there are many rich mines to show for it."

SPEAKING of the formation of local mining laws by miners' meetings, in a recent article, ex-President Harrison says: "The limits of a claim and the distribution of the water supply were prescribed and established and every man became a warranter of every other man's title. These camp legislators had this advantage of Congress and of all other legislative bodies that I know of—they had a good practical knowledge of the subjects they dealt with."

THE Spring Valley hydraulic mine at Cherokee, Butte Co. Cal., was sold last Saturday by receiver J. B. Whitcomb to attorney T. Z. Blakeman of San Francisco, for the bondholders, for $275,000. The property consists of several hundred acres of mining ground and dumping ground, as well as many miles of water ditches. It has been in litigation for several years. Other parties to the suit have six months to redeem it. Unless this is done, it is expected that the bondholders will open the mine by drifting, and employ several hundred men.

A MINING MAN, speaking of the new State Line district in the Salt Lake *Tribune*, complains that the law of Utah is lamentably lax in allowing one man to locate a hundred claims upon which the only labor expended is the erection of monuments. If forty or fifty men owned the mines of State Line, instead of the eight or ten who now control all the claims, that country would boom, because there would be some money invested and some work done. This is often the case in new mining camps, and is especially noticeable in this State. No stronger argument could be found in favor of the proposal that this State should adopt such laws as the MINING AND SCIENTIFIC PRESS has had prepared.

A CALAVERAS paper estimates that there were employed in that county 1200 miners in 1895, when the mines produced $1,718,000, and goes on to say: "Counting miners' wages at $3 per day, and allowing 300 working days in the year, it will be seen that every dollar of gold produced costs about $2 for labor alone." That conclusion is not apparent after multiplying by the rules now in use in public schools. Twelve hundred miners working 300 days at $3 per day would receive $1,080,000. Comparing this with the output, and taking into consideration the fact that a large proportion of the men were employed in developing properties that will in time produce gold, but were not doing so in 1895, the showing is very favorable.

THE annual report of the superintendent of the Eureka Consolidated Mining Company of Nevada shows that the company has been able to continue working its mines, notwithstanding low prices in the metal market, owing to the percentage of gold contained in the ores. The report shows the following figures: Sales of ores, $35,590; sundry receipts, $14; balance from previous year, $8365; total, $43,969. The payments were: Tribute ore, jiggings, etc., $12,723; ore freight to Salt Lake, $12,131; sampling, $399; mine expenses, $5547; general expenses, Eureka, $3682; expense account, San Francisco, $6761; total, $41,243. This leaves a balance of $2726 forward to new account. The company intends to continue development work on such a scale as the cash in hand will permit.

A UNITED STATES surveyor, in running a line between the timber reservation and the Muscanapahe rancho in San Bernardino county lately, discovered a witness tree at a station which has been in dispute for many years and over which thousands of dollars have been spent in litigation. In following the field notes of surveys made twenty-nine years ago, he came to a point which called for a witness tree. Seeing an old sycamore with a slight discoloration on the bark, he began to cut with his ax and split off a large slab from the trunk, when the original marks as called for in the notes were clearly revealed, as perfect in form as when freshly cut. This reestablishes the original survey of the rancho and gives to the settlers and the reservation valuable land and water rights heretofore claimed as belonging to Muscanapahe rancho.

LAST March, in accordance with a request of the California Anti-Debris Association, Governor Budd instructed E. E. Leake, Commissioner of Public Works, to make a report on the effect of restraining dams on debris caused by hydraulic mining, their relation to navigation, etc.—seven questions in all. The chief and assistant engineer to the Commissioner of Public Works have just made public their report, which is not at all what the anti-debris people expected or hoped for. Messrs. Price and Nurse say that a comprehensive and intelligent answer to the questions requires the possession of data that do not exist; that what has been done was done under the direction and subject to the inspection of eminent engineers; that the work in question appears to fill the requirements, and that to exhaustively answer the queries would require more time and money than is at the disposal of the respondents. The questions were framed in demagogic shape, implying that what they tacitly assumed to inquire about was so, and that investigation would so demonstrate. The answer of the State officials is dignified, impartial and manifestly just.

REGARDING silver the outlook is promising. It is the reported policy of the President-elect to retire the greenbacks, increase the volume of national bank notes, coin the silver bullion in the United States treasury and make provision for renewed purchase of silver to be also coined, it being expected that in a comparatively short time the country will cease having a paper money that can call for redemption in gold, thus obviating the necessity for a "gold reserve." The political aspect of the silver question is not confined to the United States. Its international importance is one of the reasons for believing that the white metal will appreciate in value. Russia's vast schemes in the Orient have included the necessary acquirement of gold and silver. The former has been secured. Russia now wishes five hundred million dollars in silver for use in her political aggrandizement as opposed to England in China and India, the great silver absorbents. In those countries the superior power offering silver is more powerful than with an army. Russia recognizes the potency of silver in her conflict for supremacy with England in the Orient, and proposes to play that for all it is worth. It is a great game between England and Russia for predominance in the territory mentioned, but chiefly interesting to American silver miners for its likelihood to favorably affect and supplement any friendly silver legislation in this country.

UNITED STATES CONSUL MARATTA, at Melbourne, has forwarded to the State Department at Washington the returns of the Melbourne branch of the royal mint of England. The returns are of much interest in connection with the gold discoveries in the colony of West Australia. Almost all the gold produced in that colony is brought to the Melbourne mint, and a pretty sure criterion of the progress (or otherwise) of the industry is thus furnished. For the first nine months of the current year the Melbourne mint has received only 152,259 ounces of gold from Western Australia, against 160,949 ounces last year, a decrease of about 8,690 ounces. Taken in conjunction with the exceedingly unsound boom now in full career at Perth, the capital of that colony, the falling off is an unhealthy omen. It would be unfair, however, says the consul, to be too pronounced until the gold fields are in proper working order, but there is obviously room for the exercise of a great deal of caution on the part of investors. As regards receipts of gold by the mint from other sources it is very satisfactory to note that Victoria has, up to the present, supplied 580,330 ounces, against 526,570 ounces for the corresponding period of 1895, and if the same rate of increase is continued, the production of the colony for 1896 will be about 775,000 ounces. Imports of gold from New Zealand and Tasmania show large increases, but much less has been received from South Australia. The total quantity of gold received by the mint from January 1st to September 30th this year is 857,641 ounces, against 785,752 ounces for the corresponding period of last year, the increase being 71,889 ounces.

A Few Points for Prospectors.

Written for the MINING AND SCIENTIFIC PRESS by DAN DE QUILLE.

The first requisite for the formation of a mineral vein is a fissure or fracture extending down through the earth's crust to the underlying heated regions. The fissures occupied by mineral veins are, in most cases, caused by the upheaval of mountain masses of granite or some other igneous rock. This being the case, we may expect to find the widest, deepest and richest ore veins on the flanks of the strongest and most elevated portions of a mountain range, at points which were centers of great disturbance at the time of the upheavals of the range under observation. As the most elevated peak of a range must have come up from a greater depth than those parts forming the extremities of the chain, the lodes found about it are likely to be larger and stronger than those situated at or near the points where the extremities of the range sink to the general level of the country.

This being the case, a good rule for the prospector to observe on entering a new region of country in search of veins of the precious metals is for him to direct his course to the main mountain range of the district and to the culminating peak of that range. As veins of gold and silver-bearing quartz are more frequently found in the neighborhood of igneous rocks than in any other situation, the place in which to search for them is evidently in mountainous regions, as the upheaval of masses of igneous rocks has in most cases caused the elevation of mountains.

Mineral veins, and particularly those of gold and silver, may be said to be a consequence of the upheaval of mountain ranges, and usually ore belts have an extent and importance corresponding to the greatness of the chain in which they occur. That mineral belts cease with the ranges in which the mineral belts are found shows that they are dependent on or a result of the upheaval of the ranges.

No two systems of veins are alike in all respects, and each must be studied by itself. Each mineral belt or system of veins seems complete in itself, and is the result of local events and conditions. The points of difference in veins and systems of veins, however, are matters to be observed and studied by the careful miner. The general rule in regard to the occurrence of mineral veins is that they are usually found in localities where igneous rocks, as dikes, have burst up through crystalline schists (altered sedimentary rocks) or stratified deposits, will hold good in nearly all regions.

Although I have given it as a good rule for the guidance of persons exploring new regions to strike for the culminating point of a range, I do not wish to have it understood that I mean to send the prospector to the top of the main peak to look for a big mine. The place in which to prospect is on the flanks of the big peaks. As lodes are most frequently found about the point of junction of dissimilar rocks, it will be well for the prospector, as a first move, to search for the point where the upheaved igneous rock first shows itself above the sedimentary formation through which it has pushed its way. A good vein is liable to be found between the two kinds of rocks. A vein so situated is known as a "contact" vein. Should no vein be found at the contact, a vein or a series of veins may most likely be found lower down, at points where fissures were formed in the sedimentary rock at the time when the igneous mass of the mountain was thrust up through it. Also, there may be on the lower part of the mountain dikes of trachyte, diorite, or other igneous rocks, and in conjunction with these good veins are liable to be found.

Where that portion of a mountain which rises above the contact is a uniform mass of granite or other igneous rock, there is little hope of finding large or valuable veins; yet, if there should be dikes of porphyry or other rock of a similar character cutting across the rock constituting the bulk of the mountain, good veins are liable to be found about the dikes. Also, it is to be remembered, that in places lodes not unfrequently appear on the surface of a sedimentary formation when the igneous dikes that produced the fissures which they fill are not visible, but are lying at some depth below, where they were halted in their upward course after having fractured the overlying country rock. Dikes of igneous rock running through a sedimentary formation or through large areas of other igneous rocks are always a good feature, and such indications of disturbing events in a section of country should always receive the earnest attention of the prospector. Dikes are frequently seen in places where no cropping of quartz veins appears. In such places veins running parallel to the dike may be found below it hidden by a covering of debris, or at the depth of a few feet there may be a contact vein on one side or the other of the dike.

The reason why mineral veins are most frequently found in connection with igneous rocks is that these rocks in bursting up through the overlying stratified rocks form fissures that extend down to the heated subterranean regions and afford passage for the upward flow of the mineral-charged waters, vapors and gases, through the action of which the fissures are filled with quartz and ores. Fissures are also formed by earthquakes and by the shrinkage of the crust of the earth. These, however, seldom contain veins of minerals, as they are widest at the top and do not extend downward to a sufficient depth to tap the heated regions beneath the earth's crust, whereas the other class of fissures start from the fiery regions and make their way to the surface alongside upheavals of igneous rocks. Some earthquake cracks and shrinkage fractures have probably been filled with mineral matter through the accident of an upheaval of igneous rock having occurred beneath them. But fissures of this class are generally found in valley regions at a distance from the main granite mass that forms the core of the culminating mountain range of the district, and are found to be filled with barren material deposited from solutions in cold surface water. The filling of such veins is known to the miners of some California camps as "he quartz."

The lodes to which the miner should give his attention are those that occur at or about the junction of igneous with sedimentary or metamorphic rocks. Although the geologists have a thousand names for the many subdivisions of rocks, all the prospector need know for his use are the two kinds—igneous and sedimentary. The igneous rocks are such as have come up from unknown fiery depths, and all the others are of sedimentary origin, being formed from material furnished by the erosion and decomposition of the igneous rocks.

All rocks formed on the surface of the earth from the debris of the old rocks are sedimentary, and the sedimentary rocks altered by heat, pressure and crystallization are called metamorphic. All other rocks are igneous, but these rocks differ greatly among themselves in texture and in many other respects. The volcanic rocks are those formed during the present and Tertiary periods. They have been ejected from volcanoes and are lavas of different kinds. No mineral veins of value will be found in such rocks. The igneous rocks, which were mostly solidified beneath the surface of the earth under great pressure (known as plutonic rocks, as granite, porphyry, trachyte and the like), are those of interest and value to the prospector.

Lodes are always more recent than the rocks they traverse, and older than the rocks or lodes by which they are intersected. Each vein system owes its existence to local events and conditions, both at the surface and at depth in the unknown subterranean regions. Each system of veins being complete in itself, the careful mining man will thoroughly examine and closely study the peculiarities of the particular system, and also of the particular vein he undertakes to develop and work.

Although systems of mineral veins differ among themselves and are of different ages, there is to be observed in them a sort of family resemblance that often extends over very large tracts of a country. This becomes apparent when we compare the mineral systems of California with those of the Great Basin region, and the mines of Nevada and Utah with those of Colorado, Montana and Dakota; yet, while the family is much the same, the children all have their own peculiar features and characteristics within certain bounds.

While there are many different belts or systems of veins in California on and along the Sierra range, they are all gold-bearing and belong to one family. This family of systems extends along all that portion of the Sierra Nevada from well up toward the south line of Oregon southward down near San Bernardino county, where, at the Mohave desert, the range is broken. Southward, in Arizona and New Mexico, come in systems of veins which belong to a different family—a family with many of the features of the Great Basin families. The territory of this southern family begins in San Bernardino county, at a point where the big break in the range occurs. A split in a range, or a break in its continuity, seems to change the character of the contents of veins over wide areas, thus forming different families of systems. The systems of veins on the flanks of a range that is continuous show a family resemblance. Breaks or splits in ranges, however, nearly always change the character of the vein systems. This is seen in the changes from silver to gold in Mexico and Peru. In the Ural and Altai mountains there are silver sections and gold sections where breaks and splits occur. In these different zones are veins and systems of veins of different ages, each possessing special family features.

In the great mountain chain which extends along the Pacific coast in almost an unbroken line from Terra del Fuego to the Arctic ocean, a distance of 9000 miles, we have an immense range of igneous rocks that is rich in the precious metals in most places throughout its whole course. Gold and silver follow the main mountain ranges of the world, and richest and best known mines are nearly always situated on or near some prominent peak on each great chain. In the Rocky mountains, the Black Hills, the Urals of Siberia and in most of the great mountain ranges where there have been upheavals and intrusions of igneous rocks the same thing is seen. Also where gold and silver were found in one part of a great range these metals are likely to be found in all parts of that range, though in some places one of these metals may predominate, while elsewhere the other will be so abundant as to hold almost exclusive possession of large regions of country.

There is a sort of relationship between the main mountain ranges, with their accompanying dikes, and the belts or systems of ore veins. First we find a huge main upheaval of granite or some other igneous rock which forms the central part or core of a range and generally protrudes above the sedimentary through which it has pushed its way; next come the dikes on each side of the main mass or core and running parallel with it on and along the flanks of the range and generally in the uplifted sedimentary rocks forming the "country." Thus the igneous rocks form a system not unlike that of the systems of quartz veins. The quartz veins seem to follow this arrangement in their systems, there being a main central vein flanked by smaller parallel veins.

The majority of prospectors do not give the dikes the attention they deserve. Whether of diorite, porphyry or some other igneous rock, the dikes are among the best known indications of the presence of quartz veins. On entering a new region the prospector should first look for and examine the contact, and next he should turn his attention to the dikes and the quartz croppings below.

The New University.

J. B. Reinstein of the Board of Regents of the State University has started East for the purpose of explaining to the architects what is the situation at the University and what will be required to comply with the plan for the proposed architectural competition. Mr. Reinstein has conceived the idea of erecting buildings for the seat of learning that will be oriental in magnificence and splendor. There is nothing new in that. Every university man while in his undergraduate days has built up in imagination a great seat of learning with magnificent structures to take the place of the sorry makeshifts of nondescript styles of architecture that now occupy the most beautiful college site in the world. But they have been built up only in imagination. With Mr. Reinstein to conceive was to execute. The dreams of all Berkeley men will be more than realized. Of course, Mr. Reinstein appreciates as well as any one else that buildings alone will not make a university great, and his plans include schemes for large endowments and the building up of an institution whose call may be considered an honor to any man of learning in the world.

The first fruits of the work that has been done is the splendid generosity of Mrs. Phœbe Hearst, which will enable the Board of Regents not only to go on with the work of preparation of plans but also to make a good start with the buildings. Aside from this, Mr. Reinstein has been promised large sums that will go toward erecting buildings or to the endowment funds. His plans include a mining school that shall be superior as to its faculty and in equipment to any in the world.

As to the preparation of the proposed plans, it is intended to offer prizes that will attract the architects of the world and the competition will become the first one of its kind of an international character. Mr. Reinstein states that the programme will provide, probably, for two competitions—a preliminary and a final one. A Board of Five Advisory Expert Architects will be established, one to be appointed by the Minister of Fine Arts of France, one by the Minister of Fine Arts of Germany, one by the Royal Institute of British Architects, one by the Head Chapter of American Architects at Washington, D. C., and one by Chapters of American Architects in California. The data, such as contour maps, casts, photographs and the like, will be distributed by the persons appointing the Advisory Board of Experts. Identity of the authors of all plans will be kept strictly secret, and probably six months' time will be given to the architects for the preliminary competition and as much more for the final competition. The Advisory Board of Architects will select from the plans submitted at the preliminary competition a number, say fifteen, the authors of which will receive each a prize of at least $500 and be requested to enter the final competition wherein their plans and ideas will be amplified and put into greater detail. From the plans submitted at the final competition, five will be selected for prizes. The author of the first and winning plan will have the construction of all buildings erected within, say, twenty-five years, and pursuant to his plans, or possibly he may be given some alternative prize. The authors of the remaining four will have distributed among them, say $5000. All matters connected with the competition, however, are indeterminate until the Board of Regents adopts the final programme for the architectural competition.

THE two elevators of the Golden Feather Company in Butte county lift eighteen thousand gallons of water each twenty-four hours over fifty feet, or two thousand tons of gravel per hour the same distance. They use 460 inches of water with a pressure of 155 pounds to the square inch for each elevator.

Turquoise Mining.

The British consul-general describing the turquoise mines near Nishapur in Persia, says: "These are believed to be the only mines in the world which have been worked extensively, or which have produced the turquoise of perfect shape and color. There is no system and no attempt to work on rational lines. The lessees have but one object, and that is to recoup their outlay, and then to amass what profit they can in the speediest manner possible, for they know that in spite of the terms of the concession if a higher bidder turns up they may be abruptly ejected at a moment's notice.

The Reish mine, which is the only one worked on a large scale or with vigor, and which produces the greater part of the turquoises at present sent to market, is near the top of one of the highest ridges, at an altitude of about 6000 feet above sea level. The entrance to the mine is a hollowed out cave, about 12 yards across, with a vertical shaft some 5 yards in diameter. Two men were reclining at the mouth of this shaft with their backs against the wall of the cave, and turning with their bare feet a ricketty wooden wheel, which brought up the debris from below in a small sheepskin bag, holding no more than a peck perhaps. This bag was received by a third man, who unhooked, emptied and reattached it. The other two men removed their feet, and the bag went down with a run some 40 feet, where three other men were similarly engaged on a ledge in the shaft. The mine itself is some 80 or 90 feet from the surface, but the descent was impracticable in boots. The miners first descend by means of a narrow diagonal tunnel, and then scramble down the rough sides of the shaft.

At the mouth of the cave, which is on the precipitous hillside, half a dozen men were seated close together on a ledge, breaking with small hammers the fragments of rock as they were brought up from below. When a turquoise was discovered it was placed on one side in its rough state, encased in rock, and in that state was sent to Meshed. About and around the cave, perched on other ledges, were numbers of small boys sifting the earth or soft debris which had been brought up with the rock from below. The bags came up pretty fast, and seemed to contain a vast number of turquoises of all sorts. Unfortunately, though the mine is very productive

and the turquoises of good shape, their color soon goes. There are about five or six other mines of modest proportions, where work is carried on by a few men. All the rest are mere burrows, with just enough room for a man to enter in a cramped position, and extend, most of them, only a few yards diagonally from the entrance. The old Abdur Rezai mine is on the extreme east, was very extensive, and produced superb turquoises of lasting color, but fell in a few years ago.

Laboratory Tests in Connection with the Extraction of Gold from Ores by the Cyanide Process.*

NUMBER IV.

By H. VAN F. FURMAN, Denver, Colo.

The results of the experiments still prove the applicability of the process to the ore in question, and the best method of treatment, i. e., the strength of solution and the mesh which will give the best extraction in the shortest time, with the least consumption of cyanide.

Where it is desired to treat larger quantities of ore a very convenient apparatus is a large glazed earthenware jar, provided with a false bottom and an outlet at one of the lower sides.

The following formula will be found convenient for calculating the percentage of extraction :

Let A = The assay value of the ore in ounces Troy per ton of 2000 pounds Av.
B = Milligrammes of gold found in filtrate.
C = Pounds Av. of ore taken for treatment.
X = The percentage of extraction.

$$X = 6.43016\frac{B}{AC}.$$

IV.—DETERMINATION OF THE CAUSE OF CYANIDE CONSUMPTION.

Should the consumption of cyanide be high, the cause of consumption may be determined by an analysis of the cyanide solution. For every part of the cyanide rendered inoperative a corresponding proportion of metal enters solution. Thus one part by weight of iron consumes seven parts by weight of potassium cyanide, etc. The following equations represent the reactions most frequently encountered :

$$Fe\,SO_4 + 6KCN = K_4\,Fe\,(CN)_6 + K_2\,SO_4\,;$$

Or

56 (at. weight of Fe): 390 (mol. wt. 6KCN) : : 1 : 7.

$$Zn\,SO_4 + 4KCN = K_2Zn\,(CN)_4 + K_2\,SO_4\,;$$

Or

65 (at. wt. Zn) : 260 (mol. wt. 4KCN : : 1 : 4.

$$2\,Cu''SO_4 + 6KCN = K_2\,Cu'\,(CN)_4 + 2K_2\,SO_4 + 2CN.$$

Salts of aluminum and magnesium act in a different manner with potassium cyanide, their hydrates being formed with the liberation of hydrocyanic acid, thus :

$$Al_2\,(SO_4)_3 + 6KCN + 6H_2O = Al_2\,(OH)_6 + 3K_2SO_4 + 6HCN$$

$$Mg\,SO_4 + 2KCN + 2H_2O = Mg(OH)_2 + K_2SO_4 + 2HCN.$$

A preliminary alkaline treatment overcomes this objectionable feature, their hydrates being precipitated, which are then inert towards potassium cyanide, thus :

$$Mg\,SO_4 + Ca\,(OH)_2 = Mg\,(OH)_2 + CaSO_4$$

insoluble magnesium hydrate and insoluble calcium sulphate being formed.

Soluble sulphides, formed by the action of potassium cyanide on some metallic sulphides, again react to some extent on the cyanide, with the formation of sulpho-cyanide of potassium, thus :

$$ZnS + 4KCN = K_2Zn(CN)_4 + K_2S$$

$$K_2S + KCN + H_2O + O = 2KOH + KCNS.$$

To determine the cause of the consumption of cyanide place 100 grammes of the pulp in a wide-mouthed bottle, add 200 c.c. of the cyanide solution and agitate for fifteen hours. Filter ; take 20 c.c. of the filtrate (equivalent to 10 grammes of ore) and evaporate almost to dryness in a porcelain dish. Add some strong sulphuric acid, evaporate almost to dryness, and cool. Dilute with water, add some hydrochloric acid, and heat to effect solution if necessary. The metal in solution may now be determined by the usual methods.

The strong sulphuric acid at a high temperature decomposes the metallic cyanides, thus :

$$2AgCN + 3H_2SN_4 + 2H_2O = Ag_2SO_4 + 2NH_4HSO_4 + 2CO_2.$$

Strong nitric acid may be used in place of strong sulphuric ; but hydrochloric cannot be used, as it leaves the metal in the form of a double cyanide salt, which is soluble.

The reactions with nitric and hydrochloric acids are :

$$AgCN + HNO_3 + 2H_2O = AgNO_3 + CO_2 + NH_3 + H.$$

$$K_4Fe(CN)_3 + 4HCl = H_4Fe(CN)_6 + 4KCl.$$

*Transactions Am. Inst. M. E., September, 1896.

V.—DETERMINATION OF THE CAUSE OF NON-EXTRACTION.

Should the above tests show a low percentage of extraction, the next step is to determine the cause of this non-extraction. It may be due to numerous causes, such as total destruction of potassium cyanide by certain salts of the base metals present in a form readily attacked by the potassium cyanide ; the gold may be in a very coarse state, in which case the solvent action of the potassium cyanide will be too slow for the practical application of the process ; the gold may be combined or alloyed with tellurium, antimony, bismuth, etc., in which case the cyanide is inoperative until the combination is broken up ; the presence of soluble sulphides in solution; the character of the gangue, such as kaolin or talc, which may be present in such quantities as to effectually prevent percolation. To overcome these difficulties the following methods may be tried :

In the case of an ore which consumes a large quantity of cyanide, if a preliminary wash with water, weak acid or alkali is ineffective, the ore may be classed as one not adapted to the process.

The coarse gold difficulty may be overcome by amalgamation, either before or after treatment with cyanide, which generally results in an excellent extraction. The South African practice may be cited as an example.

The difficulty due to the presence of bismuth, antimony, etc., in combination or as an alloy with the gold, may sometimes be overcome by fine grinding and long contact with the cyanide solution ; but the usual method is to treat the ore to a preliminary roast, which converts the gold into a condition in which it is readily attacked by cyanide.

The difficulty due to the presence of soluble sulphides can be overcome by the addition of a soluble lead salt or the addition of an oxidizing agent.

Should the ore contain much kaolin or talc, if coarse crushing is ineffectual nothing further can be done, and the ore must be classed as one non-adapted to the process.

Ores containing considerable quantities of oxidized copper minerals are to be classed as not adapted to the process.

VI.—DETERMINATION OF THE FREE POTASSIUM CYANIDE IN SOLUTION.

A number of methods have been proposed, and there are several which give good results when the solution is free from cyanides other than potassium cyanide. With complex mill solutions, containing $K_2Zn(CN)_4$, these methods fail.

With pure solutions, such as the freshly prepared stock solution, a rapid and accurate determination may be made by titrating a measured quantity of the solution to be tested with a standard solution of silver nitrate, using two or three drops of a 5 per cent solution of potassium iodide as an indicator. Silver cyanide is formed, and immediately redissolves in the excess of potassium cyanide. The reaction is as follows :

$$AgNO_3 + KCN = AgCN + KNO_3.$$

$$AgCN + KCN = KAg(CN)_2\,;$$

Or the reaction may be expressed as follows :

$$2KCN + AgNO_3 = KAg(CN)_2 + KNO_3.$$

As soon as all the potassium cyanide has been converted into the double cyanide of potassium and silver an additional drop of the silver nitrate solution produces a pale yellow opalescence, owing to the formation of silver iodide. The quantity of silver solution added is read off from the burette and the percentage of potassium cyanide is calculated.

In the United States a solution containing 6.535 grammes of silver nitrate to the liter is used. The quantity of cyanide solution usually taken is 10 c.c. When 10 c.c. of cyanide solution are taken each c.c. of the silver solution used indicates 1 pound of potassium cyanide to the ton (2000 pounds) of solution. Abroad, deci-normal silver nitrate solution is generally employed, the loss in cyanide being obtained in percentage on the ore. This percentage multiplied by 20 gives the pounds of potassium cyanide consumed per ton.

Another method which answers all purposes, provided the cyanide solutions are quite pure, but which is useless for complex mill solutions, depends upon the following reaction :

$$KCN + 2I = KI + ICN.$$

This method requires a solution of pure iodine in potassium iodide. A solution of pure wheat starch is used as an indicator. Ten or more c c. of the cyanide solution are measured off and run into a beaker. A few drops of the starch solution are added, and then the iodine solution is run in from a burette, with stirring, until an excess of one drop of the iodine solution is present, which is indicated by the formation of blue iodide of starch. The iodine solution may be standardized by some freshly prepared stock solution, or, preferably, by means of a standard solution of sodium hyposulphite. This method may be used to determine the percentage of KCN in commercial potassium cyanide.

(To be Continued.)

Africa's Condition.

The British investing public have a way of carefully looking after their holdings in companies, and at the meetings of shareholders they insist upon specific and reliable information from the directors. They do these things much better in England than in this country, where too often the shareholders are put off with glittering generalities. As a result, the stock markets are very sensitive to the reports published.

South African shares are a good example of this. The effect of the report of the Consolidated Gold Fields, Limited, has been a fall in the price of shares. This was probably due largely to a want of confidence in the claims made in the report as to the deep levels.

The London *Statist* a short time ago tabulated the capital values of ninety-six Transvaal mining companies, contrasting the present position of each company with that which it held about a year ago. On October 1, 1895, the aggregate capital value was £139,663,441; the prices at mid-October settlement this year represented a total value of only £78,706,480, showing a depreciation of £60,958,961, or 43 per cent. The biggest loss is in Rand mines—£6,321,452. Next comes East Rand, accounting for a difference of £5,037,694. Then follow Buffelsdoorn estates with £3,643,750 depreciation and Ranfontein with £3,500,000. Out of the ninety-six companies, only four show an appreciation, which is duly allowed for in arriving at the net result. Of these four, only one (Bonanza) represents a substantial amount, the increased value being £162,500.

The illiberal policy of the Transvaal Government probably has had much to do with this, but the main reason seems to be an uncertainty as to the future of the deep levels. Upon this point Dr. George F. Becker of the United States Geological Survey, in his report to the Consolidated Gold Fields, Limited, says : "It is very improbable that the ore of the deep mines in the region through which the Main Reef has been traced with certainty will show any general tendency to impoverishment ; dikes and faults will probably give less trouble in the deep mines than in the outcrop mines ; there is no ground for fearing unmanageable quantities of water, or even very serious pumping expenses ; and the temperature will increase more slowly than in most regions. There are, in my opinion, no insuperable natural obstacles to mining on the Witwatersrand at a depth of 4000 feet, and no known reason why, under favorable industrial conditions, the expense should exceed the present cost at 500 feet."

However, the principal feature about it all in the mining world is the fact that British investors are now looking more and more to other quarters of the globe for mining investments.

All this will do much toward keeping back the development of Rhodesia, where the value of the mines has not yet been proved. At an extraordinary meeting lately in London of the British South Africa Company, called to increase the capital by £1,000,000, the chairman said:

"When the board of directors issued their circular to you on February 10th last, explaining why it was expedient to defer holding the ordinary general meeting, there was nothing in the condition of affairs in Rhodesia leading us to anticipate the disasters we have since experienced and which forced us to make a new debenture issue and now necessitates our coming to you for a resolution increasing the capital of the company. The copious reports that have been published through journalistic enterprise during the current year have made you fully familiar with the matters mentioned in the circular accompanying the notice convening this meeting. I refer to the native rebellion in Rhodesia, and to the outbreak of rinderpest. The exceptionally heavy expenses thrown upon the company have exhausted the half a million cash which was on hand last February and the whole of the debenture moneys—a million and a quarter—raised in July last. The injury resulting from the cattle disease has been far-reaching. In the absence of a complete railway system, the usual mode of transport is by ox wagon. This the plague has stopped, preventing the usual flow of provisions into the country, and, as a consequence, we have been compelled to make arrangements in Rhodesia at great expense for provisioning the country during the coming rainy season, to assist both the settlers and natives. This has been successfully accomplished, and you will learn with satisfaction that there is no prospect of any renewal of such hardships as were experienced in the season of 1891–1892. The rebellion is practically over and the Imperial troops are leaving the country, the military experts considering that 200 hussars and 600 police are sufficient for the proper protection of life and property in Matabeleland. From the best calculations and estimates Lord Grey, our administrator in Rhodesia, can make, we believe the million we now propose to raise by the issue of 500,000 shares at £2, will meet whatever further exceptional outlay is necessary and carry us on until the end of September, 1897. If our anticipations are borne out, the ever-increasing revenue of the country ought next year to meet ordinary expenditure. Our advices from Buluwayo as to the prospects of the company are encouraging."

Mechanical Progress.

Gun Metal and Bronzes.

Gun metal, or ordinary bronze, is an alloy of copper and tin, with a slight percentage of zinc added to facilitate casting. The amount of tin varies from 8 per cent in soft gun metal to 20 per cent in the hard varieties, and the zinc should not exceed 5 per cent, being generally less.

This mixture forms excellent castings, sound and reliable, especially when rapidly cooled, which may be done by using iron molds. It is very largely used in naval work for valves, valve boxes, bends, propellers, stern tubes and underwater castings generally, and occasionally for the shells and doors of condensers. The alloy is also most suitable for the bushes of journals, the harder qualities being adopted for this purpose. For underwater fittings (except propellers) about 6 per cent of tin is sufficient; but castings subject to high steam pressures should have from 10 to 12 per cent, and for bushes having no white metal wearing surface from 15 to 20 per cent of tin is used.

Gun metal does not roll or forge, and is not suitable for rods or fastenings which are liable to tension. Being much stronger than cast iron and more reliably cast, its adoption instead of the latter saves a considerable amount of weight, but it is too expensive for use in the merchant service, where cast iron will serve. Steel castings are now being adopted in place of gun metal, where great strength and stiffness, combined with lightness, are required, such as for the large fittings of the main steam pipes of high-powered naval work. This alloy is more easily cast into thin castings of good size than brass, because the molten lead flows better, and it is therefore more suitable for condensers, but also more expensive. The contraction in cooling is about ⅛-inch in 10 inches. Gun metal is seriously impaired in strength by heat, the tensile strength at 500° F. being less than two-thirds that at atmospheric temperature, which ranges from 14 to 17 tons per square inch, the strongest quality being that containing from 8 to 10 per cent of tin. The elastic limit is low, ranging from three to five tons in tension. The weight of a cubic inch is 0.31 of a pound.

Phosphor Bronze.—The addition of a very slight quantity of phosphorus to the other constituents of bronze produces great changes in the qualities, materially increasing the strength and ductility. A good alloy is produced by the combination of from 0.2 to 0.3 per cent of phosphorus with a mixture of copper and tin in the proportion of 9 to 1, but the amount of phosphorus varies in different qualities from 0.03 to 0.8 per cent. In manufacturing, phosphor tin, containing a definite known amount of phosphorus, is added to copper—a process which gives a fairly good control over the composition of the resulting alloy even when the final percentage of phosphorus is very minute.

Phosphor bronze can be rolled into sheets and forged into bars, and forgings of this material are very suitable for rods and fastenings not subject to heat where strength and non-corrosive qualities are required. In sheet form the alloy is sometimes used for air-pump valves. It is largely adopted in naval work for rams and stern frames, also for propellers. Phosphor bronze is suitable for bearings, pump-water cylinders, and for piston rings, especially when working in steel barrels. It is not suitable for castings subject to heat, being liable to crack when hot, and the strength is reduced when heated even to a greater extent than with the other copper alloys. The tensile strength of cast phosphor bronze is from 17 to 22 tons per square inch and that of forgings from 25 to 30 tons, the elastic limit being about 45 per cent of the ultimate strength. Being hard and tough, this alloy resists compression well and will stand a great change of form without cracking.

Manganese bronze differs from ordinary bronze in having a slight proportion of ferro-manganese in its composition, which greatly increases the strength and toughness. The amount of manganese varies from an almost imperceptible trace to as much as 5 per cent. There are five grades of this alloy made, all of which can be cast in sand except No. 1, for which chill molds are necessary. The best and strongest forgings are of No. 1 grade, No. 2 being adopted for important castings, such as propeller blades. Nos. 4 and 5 are used for journals, being the most suitable for anti-friction purposes. The shrinkage is rather greater than that of gun metal.

Forged manganese bronze is suitable where great strength combined with non-corrosive qualities are necessary, such as for high pressure steam valve spindles, stays, thrust rods, etc. Although weakened by heat because the initial strength is too high, this alloy, when forged, is more suitable for use under heat conditions than any of the other copper alloys, with the possible exception of aluminum bronze. It was in great favor a few years since for the propeller blades of high-speed vessels, because of the good surface, fine edges and thinness obtained, another benefit claimed being that the points were only bent and not broken when struck, and could be hammered into shape again. But the latter quality is a doubtful advantage, and a long experience has shown the necessity of making blades of this material as thick as those of cast steel, so as to provide sufficient stiffness; also the smooth surface gets gradually pitted when running, but not to such an extent as with cast-steel blades. As these considerations lessen the superiority of this material over others for blades, engineers are not now so inclined to incur the additional expense involved in its use.

The tensile strength of No. 2 quality, when cast in sand, is from 28 to 32 tons per square inch, with an elongation of 13 to 20 per cent in 5 inches, the elastic limit being from 15 to 18 tons. Rolled No. 1 quality has a tensile strength of 33 tons and an elastic limit of 22 tons, with an elongation of 25 per cent as delivered from the rolls. After cold-rolling, the ultimate strength is 40 tons, and the elastic limit 30 tons, with an elongation of 10 per cent.

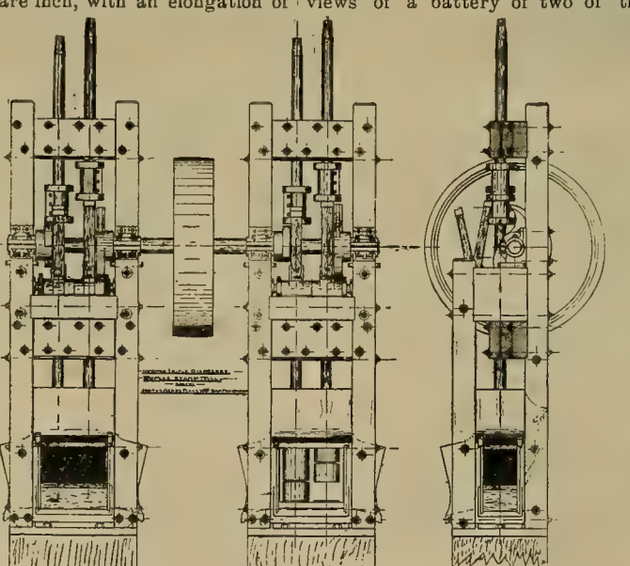
Aluminum bronze contains from 7 to 10 per cent of aluminum, alloyed with copper; also, traces of iron, silicon, phosphorus and other impurities, which, however, should be got rid of as far as practicable. These proportions of copper and aluminum have been found to give the best results as to strength, small cast bars having shown an ultimate tensile strength of 44 tons per square inch, with an elastic limit of 31 tons and an elongation of 10 per cent, still better results being obtained with rolled bars. This alloy shrinks and cools more rapidly than gun metal, being therefore more difficult to cast. It is the least corrodible of the copper alloys, and it is said to have the valuable quality of withstanding a high temperature without loss of strength. Being also somewhat lighter than the other bronzes, it promises to become the most important of the group, but at present practical experience of its use is very limited. The presence of a slight percentage of aluminum in any copper alloy improves its ability to resist corrosion, and the water pipes of some marine machinery are now being made of a mixture of copper and aluminum in the proportion of 99 to 1, and it seems probable that aluminum-bronze forgings will soon supersede forgings made of the other special bronzes.

White Metals.—There are various anti-friction metals of this class, Parson's and Babbitt's being good examples—the latter an alloy of 10 parts of tin, 1 of copper and 1 of antimony. When the surfaces work in water, Fenton's metal is very suitable, the composition being 8 parts zinc, 1.66 of tin and 0.34 of copper.

Another good white metal with ordinary lubrication has a composition of 85 per cent tin, 9 per cent antimony and 6 per cent copper. In some other successful anti-friction alloys lead is the chief constituent. Before pouring white metal into place, it is a good plan to tin the surface which contains it, which in any case must be quite clean and dry. White metal is used for the bearing surface in some types of piston rod packing, and in such cases care must be taken that the alloy has a fairly high melting point—say, not less than 700° F.

Triple Discharge Two-Stamp Gold Quartz Mill.

The engraving below illustrates a recently designed and improved form of a triple discharge two-stamp gold quartz mill, showing front and end views of a battery of two of these mills in combination, driven from one cam shaft and pulley. The novel features which have been introduced into the construction of this style of mill consist in the combination of a heavy stamp, given an unusually quick drop, and an extremely large area of screen discharge. The following is a general description of their construction and the principles involved in their operation:



Front Views. End View.

TRIPLE DISCHARGE TWO-STAMP GOLD QUARTZ MILL.

The mortars are cast with triple or three-way discharge openings, i. e., there are three discharge outlets, one in front and one in each of the two sides or ends, thus giving a screen discharge area of 465 square inches, which very closely approximates the discharge area of the best style of mortars used in five-stamp batteries, that area being usually 480 square inches, a difference of only 15 square inches between the two. The stamps weigh 850 pounds each, with a drop of 110 per minute through a mean space of 6 inches. The mortars are cast to weigh, cleaned, about 2800 pounds.

These mills were designed for use in the milling of ores extracted in prospecting and developing gold-bearing quartz mines, as the crushing capacity of all stamp mills is measurably governed by the character of the ores, and as it is generally the fact that the ores encountered in opening gold quartz mines are ordinarily easily disintegrated by stamping.

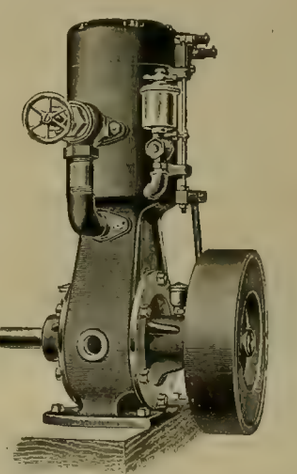
The crushing capacity of these mills is stated to be from six to ten tons of ore per day of twenty-four hours for each two stamps, or from three to five tons per day per stamp.

The power required to drive one of these mills is estimated at 6 H. P. as maximum. The weight, including battery frame, complete, is about 7500 pounds. The mortars—the heaviest part—can be cast in sections for mule-packing.

The Joshua Hendy Machine Works, 42 Fremont St., San Francisco, designed and builds these mills.

Simplex Naphtha Launch Engine.

This engine, made by C. P. Willard & Co., Chicago, is especially designed for marine work, and belongs to the class of vapor engines which receive an impulse at each revolution. The supply



of vapor to the engine cylinder is regulated by the use of an ordinary throttle valve in the same manner as a steam engine, and each charge is fired by an electric spark from a sealed battery. If high rotary speed is desired, these engines can be speeded up to 500 revolutions per minute.

Scientific Progress.

THE phenomena of rain are imitiated by Prof. Errera, of Brussels University, in a beaker. The glass, 8 inches tall by 5 in diameter, is half filled with 92 per cent alcohol, covered with a saucer and thoroughly heated over a water bath without boiling the liquid. It is then carefully removed to a wooden table. Soon the alcohol vapor is condensed into visible clouds by the cooling saucer, innumerable miniature droplets of rain fall and the clouds become gradually lowered away from the saucer. The miniature storm may last half an hour. The action is intensified if the warm saucer is replaced by a cold one. Whirlwinds and squalls are produced when the alcohol is very warm, and if the liquid is warmer on one side the clouds may be seen to rotate around a horizontal axis.

CONSIDERABLE more interest in the evolution of the horseless carriage is taken in Europe than in this country. This is probably largely due to the fact that the roads abroad are so much better than ours. Considerable money has been put into various devices, and no end of ingenuity engaged in improving or designing methods. Exhibitions of carriages have been numerous and popular, and large amounts of capital have been invested in experiments. James Long, in *Industries and Iron*,

speaking of them, says: "The adoption of electricity for the propulsion of the horseless carriage is as yet improbable. Thus far the thoughts of English engineers have been directed to the application either of petroleum or of steam. Whether in this particular field petroleum will displace steam, or steam will displace petroleum, is a matter which at present it is impossible to determine. There are some authorities who hold that steam will eventually prove the more effective and economical means of propulsion, whereas, if we inspect the motors now in existence, we find that petroleum is more generally used, because it enables the engineer to produce a lighter machine than is possible under present conditions with steam, and because the cost of running a petroleum motor is comparatively small."

ACCORDING to *Engineering*, some recent researches by Captain Abney show that the light of the starry sky is to that of the full moon about as 1:44,000. The latter is usually considered to be about as 1:600,000 to that of the sun at noon, so that we receive over 13,000,000 million times as much light as from the stars, taking both hemispheres into consideration.

THE value of the future depends entirely upon the value attached to to-day; there is no magic in the years to come; nothing can bloom in those fairer fields save that which is shown to-day.

Electrical Progress.

Electricity vs. Compressed Air.

Written for the MINING AND SCIENTIFIC PRESS by LEWIS SEARING, Denver, Col.

Last year the writer was called upon to investigate the compressed air system in operation at one of the largest coal mines of the Colorado Fuel and Iron Company, to ascertain the possible saving that could be made by substituting electricity. The result of the investigation showed such a great possibility for saving by the use of electricity that the Fuel Company decided to have a plant installed. The installation was made under the personal supervision of the writer and afterwards operated under his direction for over a month.

The above-mentioned mine (see page 437) is located at Rouse, Colorado, at an altitude of 6000 feet. The compressed air plant was employed only for pumping and comprises three compressors, each with 13½-inch H. P. air cylinder, 22-inch L. P. air and 20-inch steam cylinder, all of 24-inch stroke. The air cylinders are water-jacketed.

The air receiver stands outside of the compressor house and is 4 feet in diameter by 12 feet high, having no covering. The air is conducted down No. 1 mine by a 4-inch pipe to a duplex direct-acting pump, 18½-inch steam by 9½-inch water cylinder by 12-inch stroke, located near the face of the slope.

The order for the electric plant was given to the Denver Engineering Works Company, who were instructed to install sufficient power to operate, in addition to the regular pump, the ventilating fans, screens and shops about the mine, the selection of the machinery being left entirely to the engineers of the Denver Engineering Works. The plant as installed is described as follows: The power house is a substantial building of wood, covered with corrugated iron and completely sealed inside. It is large enough for two generating units and condensers and is equipped with a 6000 pounds capacity three-motion traveling crane.

One generating unit only was installed, it being the intention of the Fuel Company to install the second reserve unit as soon as the electric system should demonstrate its success. The engine is a vertical cross compound marine type. The cylinders are 11x19x15-inch stroke, developing 150 H. P. at 250 revolutions, non-condensing. The condenser is a surface condenser of the Admiralty type. The generator, mounted direct upon the shaft of the engine, has a capacity of 190 amperes and 550 volts. The generator, as well as all the motors, is a multipolar machine built by the General Electric Company. To insure absolute protection from lightning, which is very severe in this locality, all circuits are placed underground. The important circuits consist of iron-armored and lead cables, while the lighting circuits are made by running rubber-covered wire in iron pipes.

There are two small pumps used as sinking pumps, which are of the duplex type, having water ends, and driven through gearing by a 15 H. P. motor mounted on same frame. The cylinders are 7x10 inches and have a capacity of 250 gallons per minute against a head of 115 feet. The pumps are mounted on a four-wheel truck and can be moved around as desired. The station pumps, two in number, are double-acting duplex, with water ends, and cylinders 9½x12-inch, geared to a 110 H. P. motor. These pumps have each a capacity of 600 gallons per minute against a head of 400 feet.

The average of numerous tests on two small electric pumps gave the following results:

Average gallons per minute discharged	500
Average pressure at pumps	56.5
Average strokes per minute, each pump	172
Average amperes	37
Average station voltage	475
Average I. H. P. at engine	32.86
Average H. P. at pump discharge	16.4
EFFICIENCY.	
Generating unit, engine and dynamo	71.5%
Motor, pump and line	70.0%
Total from cylinder of engine to water discharge of pump	50.0%

As soon as the first station pump was started and in good running order tests were made with the following results:

Average gallons per minute discharged	650
Average pressure at pump	64
Average strokes per minute	188
Average amperes	53.5
Average station voltage	550
Average I. H. P. at engine	53.6
Average H. P. at pump discharge	24
EFFICIENCY.	
Generating unit, engine and dynamo	73.0%
Motor, pump and line	61.0%
Total from engine cylinder to pump discharge	44.5%

Although the total efficiency with the small pump is as high as predicted, it is, nevertheless, true that the engine and dynamo are working at a disadvantage, with a load of but 20% of their rated capacity. In the case of the large pump the generating unit is underloaded, as is also the pump, which combine to bring the total efficiency below the estimated 50%. When the mine is finally pumped out and all pumps and motors running the generator and engine will have a comfortable load, and it is safe to say that the total efficiency of the pumping plant will then be very close to 60%.

The fact remains, however, that at the efficiency above shown by the present working the former pumping of 400 gallons per minute against 120 pounds pressure, which equals 28 H. P., can be accomplished by the electric plant with but 56 H. P. at the surface, instead of 312, as before.

THERE is an interesting system of electric tramways being built in Genoa, Italy. There is no city in the world of the size built on such a steep sidehill as Genoa, and, to overcome the sharp gradients existing, several spiral tunnels have had to be pierced in the hillside, through which the electrical cars rise from one level to the other. The system inside the town will, when built, aggregate some thirty miles of track. Besides the town lines, lines are being built from Genoa to Nervi, Genoa to Voltri, and Genoa to Pontedecimo. The aggregate of these latter lines will be some forty miles, and alternating transformer substations will be used, somewhat similar to the system now running in Dublin.

RECENT developments in electricity have given a great stimulus to manufacturers of air compressing devices, and mutual aid and encouragement is resultant, says the Chicago *Journal of Commerce*. This co-operation is seen in most of the large railway yards of America, the electro-pneumatic switch involving a combination of the two elements. Compressed air in this device in yards around Chicago is now conveyed twenty miles along the road in each direction. Electricity handles the trigger, while compressed air is the power which does the work, a striking example of an instance where the latter comes in to the best advantage.

M. MOISSAN states in the Annales de Chimie et de Physique that the most stable compounds known to science disappear in the electric furnace. The only exceptions are the perfectly crystallized borides, silicides and carbides discovered by him. These, he thinks probable, are original constituents of the globe and must still exist in some of the stars.

Practical Information.

Briquettes from Culm Heaps.

Briquette making has become quite an industry in Germany, Austria and France, where the fuel question is much more important than it is in this country, and culm piles are being carefully utilized in those countries and made a profitable source of income.

Brown coal has so far been the chief material for briquettes, but in latter days, experiments with briquettes of solidified petroleum or residuum have been made which, however, did not result satisfactorily for the reason that the boilers were unable to withstand the intense heat developed by this kind of fuel.

L'Industrie describes a process devised by the chemist Velna who uses petroleum or mineral tar only for enriching culm and other inferior, formerly worthless combustibles, and produces briquettes from this material, the heating power of which is 30 per cent higher than that of good coal. He first prepares a mixture consisting of petroleum or bituminous shale tar, oleine and soda in suitable proportion, and by this means the culm, slack, or coal dust is cemented together. Three kinds of briquettes are produced in this way, namely, industrial briquettes for general firing purposes, gas briquettes for the manufacture of illuminating gas and metallurgical coke.

If culm or dust from a good coal valued at $1.20 would be taken for the production of briquettes, 6 per cent of the mixture would be sufficient. The price of a ton of briquettes would then be as follows:

1800 pounds of coal dust at $1.20 a ton	$1.25
120 pounds of the mixture at $12 a ton	.72
Cost of labor	.40
Total per ton	$2.25

If waste of a poorer coal be used, 10 per cent of the mixture would be the proper proportion. Supposing the waste, culm or slack, costs $1 a ton, the price of a ton of briquettes would be $2.50 under these circumstances. In the first case, there will be a saving of 25 per cent, in the second of 16 per cent. Considering further that the heating power of briquettes exceeds that of the average coal by at least 25 per cent, 1500 pounds of briquettes would be equal in heating value to a ton of coal. This would mean also a great saving of storeroom on board of steamers.

MORE than one-third of the entire population of the United States now live in cities. In some States it is much greater; in Massachusetts, 70 per cent; in New York, 60 per cent; in Connecticut, 54 per cent; in New Jersey, 52 per cent. In 1790 there were but six cities —i. e., having a population of more than 8000; in 1890 there were 448 such cities. In 1840 there were but three cities with more than 100,000 inhabitants; in 1890 there were 28 such cities. In 1870 there was no city having 1,000,000 inhabitants; in 1890 there were three such cities. In 1896 the new New York is estimated to contain 3,200,000, or nearly as many as the thirteen United States when George Washington took the oath of office as first President. This century came in without a single city in christendom with a million inhabitants. Paris had in 1800 but 548,000; London and its suburbs in 1801, 864,845. The other great English cities had less than 100,000. Great cities could not endure then. First, the people could not be fed on food produced within twenty miles of the place of consumption. Science has now made it possible to transport food half way around the globe and has discovered new methods of preservation as well.

Iron Bar 2000 Years Old.

S. T. Wellman has a portion of a round bar of iron—and a few like pieces are held in the United States—that antedates the Christian era by two or three centuries. The iron, which had been originally hammered into plates, and was deeply rusted from age, was found a few years ago by Dr. Karl Humann in the ruins of the temple of Artemus Leucophrine, at Magnesia, Asia Minor. Dr. Humann sent it to Hibauer, in Germany, and the latter made a portion of it a memorial tablet. This was presented to Bismarck in April, 1894. It bore this inscription in German:

"For you, Prince Bismarck, the Iron Chancellor, Hermogenes forged this iron at Magnesia, 200 B. C. Humann found it in the Temple of Artemus after 2000 years and sent it to Hallbauer, who gave it the form in which it shall bear witness that your deeds shall outlive millenia."

At the time of the presentation to Bismarck, Stahl & Eisen gave a photographic reproduction of the plate and an account of the discovery of the iron. The temple of Artemus, one of the most magnificent of ancient monuments, was rebuilt about 300 B. C., though by some the date is put at 200 B. C.

The metal is described as approximating steel in its composition, though closely akin to malleable iron. It was made at a low temperature and great care was necessary in the forging. It was found rather difficult to roll the pieces that were preserved as relics, these having a diameter of about one-half inch.

SPECIAL TREASURY AGENT AYER, in his report on the domestic tin industry, states that during the fiscal year ended June 30, 1896, the production in the United States of commercial tin and terne plates was 307,228,621 pounds, against 193,801,073 pounds produced during the previous fiscal year, showing thereby an increased production of more than 58 per cent. Of the production for the year, 303,002,098 pounds, or more than 98½ per cent, were made from sheets rolled in the United States, against about 83 per cent made from such sheets during the fiscal year ended June 30, 1895. The production of black plates in the United States during the fiscal year was 334,014,793, as against 148,443,319 for the previous year, showing an increased production of about 80 per cent.

THE Commission which has been inquiring into the proposal to unite New York and Philadelphia by means of a ship canal, has issued its report. Two surveys were made under the direction of the Commission. By either route vessels would use the Delaware river from Philadelphia to Bordentown. Thence a canal would be cut across New Jersey, entering the sea at Sandy Hook. The distance between the two cities would thus be reduced from 274 miles to 92 miles, of which 31½ miles would represent the canal.

LOCOMOTIVES destined for exceedingly fast runs require training, as do race horses. The locomotive built for speed is first put to work on some small branch line, with light trucks, until it becomes accustomed to running, and all the parts are brought down to their proper bearings. Having undergone this periodical probation, it is taken on to more important portions of the lines, and gradually worked up by increasing speed until it is given its place on the line of the great flyers. To train a locomotive takes about two months.

Coast Industrial Notes.

—The Southern Pacific will build a $5000 depot at Los Alamitos.

—The peat land celery crop near Anaheim, Cal., this year will be from 400 to 500 carloads.

—The United States engineers at San Francisco have advertised for bids for the construction of a gun battery at Ballast point, in San Diego harbor.

—The Pacific Coast Steamship Company's steamer San Benito was wrecked at Point Arena last Sunday and was a total loss. Eight of her crew were drowned.

—Seventeen carloads of English walnuts, worth $30,000, were shipped last week from Aliso station, near Tustin, and there remain three carloads more for export.

—Nearly all the cattle in Eastern Nevada have been purchased by Eastern buyers. They pay $25 for the tail ends of bands and $17 per head for cows and bulls.

—Ex-Judge James A. Waymire, who had contracted two years ago with the Board of Directors of the Turlock district to complete their irrigation system for the remaining bonds, some $400,000, has now offered to go on and carry out the contract.

—It is said that the effect of the Wright law decision may injuriously affect the $1,500,000 contract recently made by San Diego for a water system, as that contract is said to be involved in some way with the rights of the Jamacha irrigation district.

—Directors of the Pacific Mail Steamship Company have declared a dividend of 1 per cent cash, payable December 1st, the first dividend declared by the company for many years. The company is reported to have cash on hand amounting to $1,500,000. The directors have authorized C. P. Huntington to contract for an additional steamer.

—San Francisco exports of flour during the first ten months of 1896 were 966,667 barrels, against 760,567 barrels during the same period in 1895. Reducing this flour to a wheat basis and adding it to the exported wheat gives total exports of breadstuffs for the first ten months of 1896 of 12,428,000 ctls; valued at $13,745,000, against 11,028,300 ctls. at $10,337,000 for the same time in 1895. The quantity shipped this year is the largest since 1891.

—The Sierra Pacific Railway Company has incorporated in Amador county, Cal., for fifty years, its principal place of business San Francisco, to build a railroad from Stockton to Jackson, fifty miles, with a branch line of six miles to San Andreas, a branch line of two miles to Campo Seco, and one of two miles above Jenny Lind, in Calaveras county. The charter calls for the use of steam, electricity or other power for the road, but does not convey any idea as to its gauge.

—The population of Mexico in 1895 was 12,570,195, from which should be deducted 209,805 persons who are reported as "absent from the country." Most of them are in Texas, New Mexico, Arizona and Colorado, and other Western States. The number of foreigners living in Mexico is reported to be 246,985. Three-fourths of them are Americans employed upon the railroads and in the mines. There are over 5000 American citizens in Monterey and over 2500 in the federal district. This leaves the net native population 12,113,405, divided as follows:

Professional men, landed proprietors and capitalists	500,000
Federal, State and municipal officials, soldiers, etc	450,000
Engaged in mercantile pursuits	750,000
Employed upon railroads	350,000
Factory operatives	750,000
Artisans of various occupations	750,000
Employed upon farms	5,000,000
Employed in mines	2,250,000
Laborers in cities and various occupations	1,500,000
Wild Indians	200,000

Books Received.

Some Details as to Smelting Practice and Equipments for the Reduction of Gold, Silver, Lead and Copper Ores.—This is a valuable and timely publication, issued by The Colorado Iron Works. The proportion of ores that cannot be worked by ordinary milling is continually increasing, and the improvements of late in the methods of working rebellious ores have been very important. Two chapters of this work—"A Hot Blast System for Copper Matting and Silver-Lead Furnaces" and "Interior Contour of Blast Furnaces"—were published in the MINING AND SCIENTIFIC PRESS from advance sheets. Published by The Colorado Iron Works Co., Denver, Col.

The Story of the Mine, as Illustrated by the Great Comstock Lode of Nevada.—By Charles Howard Shinn. In this book—one of the Story of the West series—Mr. Shinn has given an interesting picture of Western mining. His story centers about the Comstock, the greatest of all mines. The miner of this part of the continent many have tried to sketch, but few have entered into the spirit of his life. Mr. Shinn is a Californian and knows his subject. He makes no attempt at a technical description of mining, yet the book cannot fail to interest every miner, and will be of value to many who know little of the industry that has made this region great. Published by D. Appleton & Co., New York; price $1.50.

A Textbook of Plane Surveying.—By William G. Raymond, C. E. This work is a manual for the study and practice of surveying that will be found to be of value. The particular advantages are the arrangement of the subjects and the clearness and simplicity with which all points are expressed. The author is professor of geodesy, road engineering and topographical drawing in the Rensselaer Polytechnic Institute and knows the value of making clear and accurate statements in mathematical subjects. A large number of original problems and illustrative examples is given, furnishing valuable material for practice. Published by the American Book Company, New York, Cincinnati and Chicago; price, $3.

Specifications of Mining and Milling Plants for Prospecting and Developing Gold Quartz Mines.—The Joshua Hendy Machine Works, 38 Fremont street, San Francisco, publish an interesting catalogue of the principal mining machinery of the latest designs that will be of interest to miners. Sent on application.

Personal.

E. A. RIX has returned from a visit to the Cœur d'Alenes.

E. A. WILTSEE has been in the Jacalitos district, in Lower California, examining some mining property.

W. H. HAMPTON, Wolf Creek, Or., has been re-elected president of the Southern Oregon Miners' Association.

CAPT. THOMAS MEIN has gone down to the Steeple Rock properties of the Exploration Company in New Mexico.

SENATOR JOHN P. JONES returned from Nevada and the East last week and has gone down to his home at Santa Monica.

JAMES D. HAGUE lately went to the Tomboy mine at Telluride, Colorado, for the Exploration Company who purchased the property a few days ago.

PROF. LINDGREN of the United States Geological Survey has been for two weeks in the southern part of Wyoming making a preliminary survey of the geological formation.

C. J. JOHNSTON, a California miner, is the latest to go to Johannesburg, at a salary of $20,000 per annum. He will have charge of the mines of the Knight Co., twelve miles from Johannesburg, South Africa.

IT IS understood that Hamilton Smith, who has been at the Anaconda copper properties, will, after making an examination of the Tom Boy at Telluride, come out to San Francisco, and will remain on the coast some time.

AGNES M. CANNON ran against her husband for State Senator in the 6th senatorial district of Utah, and beat him 4000 votes. Mrs. Molloy is elected as a presidental elector in Wyoming. Mrs. Amelia Lichau and Mrs. Mattie Cramer have been elected members of the California State Miners' Association. Each case mentioned is the first of its kind in ancient or modern history.

Obituary.

DR. G. H. C. BONTE, who has for many years been secretary of the Board of Regents of the University of California and professor of legal ethics, died at Sacramento last Tuesday, aged 65.

SPENCER C. BROWNE died suddenly of heart disease at his home in Oakland last Monday evening. The deceased was a son of the late J. Ross Browne, once United States Minister to China and a well-known authority and writer on mining matters. Spencer Browne has for about a year past been superintendent of the Oneida mine in Amador county. Ross E. Browne is a brother and Charles F. Hoffman a brother-in-law of the deceased. He leaves a widow and three children. The deceased was highly esteemed by all who knew him.

RUPTURE, Hydrocele, Varicocele, Piles, Fissure, Fistula, Ulceration, etc., cured without operation or detention from business. ☞ NO PAY UNTIL CURED ☜ Consultation Free. Call or send for pamphlet.

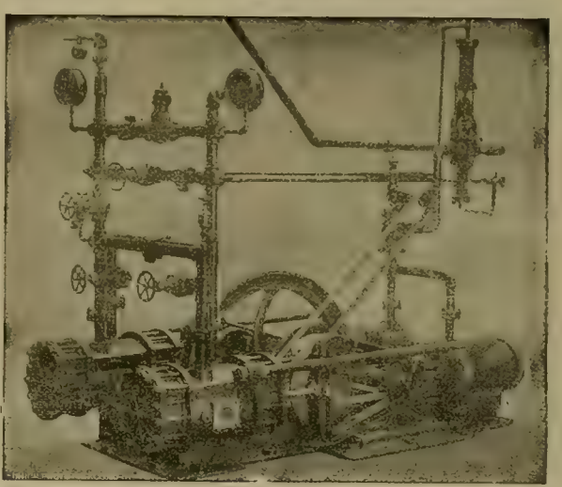
DOUBLE PIPE AIR COMPRESSOR.



This is a cut of the Double Pipe AirCompressor, the Compressor that is guaranteed to save 30% in power over any other make. It is cheapest to buy, cheapest to carry about and cheapest to run. If your fuel or water costs you anything, you want this Compressor. If you can get railroad freights free, and can carry machinery to your mine without cost, and your power costs you nothing, any make of Compressor will do you. You will be under no necessity to write to PNEUMATIC POWER CO., at 306 Pine St., San Francisco, Cal. We could save you money, though, in cost of foundations, as our Compressors are half the size of other makes.

Mining Summary.

CALIFORNIA.

Amador.

The Argonaut Mining Company will crush 500 tons of ore at the Zeile mill. The Argonaut shaft south drifts from the 1150, 1250 and 1350-foot levels show 20 feet wide of ribbon rock. Fifty men are employed.

At the Pocahontas mine in Drytown district the shaft is down 90 feet, and in the crosscut four ledges have already been encountered. The last one struck is 23 feet wide and prospects well.

At the Bay State mine in Plymouth district the 10-stamp is running regularly on good rock from the 700-level, where drifting and stoping is in progress. On the 300-level a crosscut is being run for the west ledge. It is in about 50 feet, and they expect to encounter the vein in about 300 feet.

Ledger: At the Union Consolidated at Weiland, B. Bibo, the superintendent has fifteen stamps dropping upon good pay ore from the gouge ledge at the 300 station. The other fifteen stamps of the mill will be started as soon as they are repaired. In addition to taking out ore, shifts of men are engaged in crosscutting south at the 400 from the west ledge to the gouge ledge, and drifting both east and west from the same level, and sinking the shaft from the 400 to the 500-foot level. Fifteen additional miners were put to work this week.

Angus Mackintosh of San Francisco, who, with others, purchased the Del Ray property, near Middle Bar, and prospected it, sold their interests to Captain Eads and others last week. The owners have ordered material for a whim and shaft, and will begin to sink on the property.

At the Bellweather mine the shaft is now down over 250 feet, and is being sunk at the rate of 52 feet a month. Enough material is on the ground to sink 500 feet. The shaft is in slate, and stringers of ore are struck as they go down.

Republican: At the Alma mine they are pushing the work of sinking the shaft to the depth of 1050 feet, with about 150 feet more to sink. When this is done the work of opening up the mine will be undertaken. The ledge will be tapped from three levels. To complete sinking will take until January, and to open up the levels will require three or four months.

At the Oneida the shaft has reached 500 feet, and sinking has been prosecuted without any drawback.

At the Argonaut they have met with a large body of ore, both north and south of the shaft. While it is thought to be rather low grade, little doubt is entertained that it will pay to mill. A test crushing of 500 or 1000 tons will soon be made at the Zeila mill.

At the Union Consolidated fifteen stamps are running day and night. Quite a number of new men were put on this week on account of starting in to sink to the 500. The station at the 400 is completed, and from this point they are drifting east and west, also crosscutting to the south to get into the gouge ledge.

Butte.

The Cherokee Flat hydraulic gold mines, with a record so far of producing $13,000,000, which has been tied up with litigation for ten years past between the Bank of California on one hand and the bondholders on the other, was last Saturday sold under foreclosure sale. The entire property, consisting of 1000 acres of auriferous channel, 100 miles of water ditches and thirty miles of channel for "debris," was bid in by a committee of bondholders for $275,000. The mines, until the commencement of litigation in 1886, were worked continuously for over thirty years, employing from 300 to 400 men. It is estimated that over half the gold-bearing channel still remains untouched, prospecting tunnels showing it to be as rich as that part already mined. For ten years the Bank of California and N. D. Rideout have contended against the bondholders to prevent foreclosure, which was finally granted a few months ago. During the past ten years the mine has not been abandoned, there being over 100 men in companies of from five to twenty-five men each working the least valuable part of the lead upon a royalty. Work upon the main channel has, however, been suspended. It is the intention of the bondholders, in the event of their not getting their price for the mine, to develop and operate it themselves. Several companies, are, however, examining the property.

Calaveras.

(Special Correspondence). — The Melones Mining Company is proceeding with the development of their mining property under the supervision of foreman Bert Del Ray. They have just completed a hoisting plant, 80-horse power boiler, double acting hoisting engine, gallows frame, engine house—all of a class that promises continuous work. The old shaft is over 400 feet deep. They will commence unwatering the mine at once and continue sinking the shaft, crosscutting as they go. They have secured nine acres of ground adjoining the river (Stanislaus) for a millsite. On the Carson Hill end of the property they are sinking a new shaft on the Reserve mine, and are now engaged in equipping this mine with a new and complete hoisting plant.

Everything is working satisfactorily at the Jones mine, belonging to the Carson Creek Mining Company since the introduction of their new compressor plant, which has a capacity for fourteen drills, and also furnishes air for the pumps. It was built here in the mountains, at the foundry of Demarest & Fullen, Altaville. The old mill has also been entirely rebuilt and remodeled, and a chlorination plant, with a daily capacity of ten tons of sulphurets has also been added. The shaft is being retimbered and enlarged, and when this is completed they will treat at the mill 130 tons of ore daily. The mine is making satisfactory returns. Much of the success here is due to the youngest partner in the concern, Mr. Cohen, and to Mr. Naylor Williams, his superintendent.

The Santa Anna mine continues sinking its shaft. It has passed the 300 level, where a crosscut to the vein developed 12 feet of ore. The shaft will be continued to a depth of 600 feet, with crosscuts run to cut the vein at every hundred feet. The plant here, for a small one, is very complete, and excellent work is being done sinking and drifting.

Fred Bruner is pumping out the water of his Bald Hill mine to show it to some intending purchasers.

At his Pure Quill mine they have just made a trial test of thirty tons of ore. It went $5 free gold and suphurets so rich that I hesitate to report the value until the returns come from Selby's.

Work on Charles Trayon's mine is progressing favorably. They are down 160 feet, have cut the Utica vein, and with assays as high $120 a ton, have no use to worry about the future.

On the Ghost mine, belonging to the same owners, their shaft is down over 200 feet, and being pushed right along. I am afraid they are too far east here.

The Blair mine has started up with good backing. They have a good property, and just in their immediate neighborhood there are as good prospects as can be found in the State.

If the California Exploration Company do bring electric power to this part of the county, and will furnish it strictly at a fair cost to the mine-owners, you will see in the near future some of the best mines on the mother load developed near Altaville.

Mercer & Son have started work on their mine. It is showing well. Of course, the Utica is doing well—just the same all the time. It is hard to get a bed these nights at the hotels in Angels, for men hunting for mines are the principal patrons. Angels Camp has been under a cloud for some years as a mining center. The change for the better now taking place is very apparent. It will not be very long before I can chronicle news of a strike, or strikes, which will prove to the doubting Thomases that there is more than one Utica on the lode between Angels Camp and the Stanislaus.

Angels, Cal., Nov. 24th, '96.

Chronicle: The Hexter tunnel is now in 1030 feet.

The California Exploration Company has ten tons of track iron, two large ore cars and four carloads of redwood poles for electric light and power at Valley Spring. The track iron and ore cars will be used in running the new tunnel at the Gottschalk mine.

At El Encino mine last week 150 tons of gravel, principally taken from the bench on the north drift, was put through the mill, and it paid well.

The Quartz Glen Mining Company, recently incorporated, will work the mine of the same name, located a short distance from Rich Gulch and known as the Foote & Thompson. The lower or south tunnel has been driven into the mountain about 250 feet, and an upraise has been made from the upper tunnel something over 100 feet to connect with the old workings made by the first owners, Foote & Thompson. There is a 20-stamp mill on the ground, part of which has been kept running days to prospect the ore from different parts of the mine, of which there is a large amount in sight.

Work on the Golden Hill mine, which adjoins the Spring Gulch, has been commenced by the California Exploration Company.

Angels Voice: The Stickle shaft of the Utica will be closed shortly for repairs, as the large amount of rock taken out close to the shaft has made too much pressure for the timbering. A new shaft will be sunk to connect with the winze on the 1000-foot level. This is thought by outsiders to be a favorable indication of the mineral wealth still uncovered, as the cost of such a shaft is not considered to be less than $30 a foot, or $30,000.

Prospect: The Sheffield mine, owned by Porteous brothers, has been bonded by Col. Robinson, who has put up a 3-stamp mill and hoisting works.

The Congdon brothers have built a 3-stamp mill on their mine on the south fork of the Mokelumne river. The character of the rock is a sandy lava, milling about $3 to the ton, and the vein is about 20 feet in width. The whole mountain through which this ledge passes is of a lava formation, but the vein, although partaking of the nature of the country rock, is well defined and can be clearly traced through the entire mountain.

At the Blue Bell mine, owned by the Lloyd brothers, near the source of the Mokelumne ditch, a 4-stamp mill has been put up and the stamps began dropping on rock last week.

The Mitchell mine, near Railroad Flat, is running with about thirty men, and the 10-stamp mill which is being built will be ready to crush in a few days. Hoisting works have been erected and a tunnel is being run along the vein. It is the proposition, however, to sink a shaft at the mouth of this tunnel to a depth of 1000 feet. The ledge is about 3 feet wide, showing free gold and carrying a large percentage of sulphurets.

The Petticoat mine, near Railroad Flat, is being reopened under the management of W. H. Clay, Jr. The old shaft, which is 400 feet deep, has been cleaned out and retimbered down to water. A 70 H. P. engine and boiler are now being put in place. This mine was worked in early days and was very rich, but, like all tellurium rock mines, when the water level was reached the ore required a process of reduction which was not at that time known.

At the North Extension of the Mitchell mine, owned by O. Lampson, a shaft 20 feet in depth has been sunk, showing a lead 1 foot in width, with rock that will mill about $40 to the ton. The vein gives indications of widening in depth.

The Ponge or Swiss mine, in Blue Mountain district, has been taken hold of by a San Francisco company. A contract has been let to run 150 feet of a tunnel.

The Soap Root mine, near West Point, which was worked for about a year by an English company, has closed down.

Citizen: The shaft at the Gwin mine is now down 1412 feet. The rock in the bottom is very hard and slow progress is being made. The station timbers for the 1400-level are in place, and after the sump is completed the station will be cut and a crosscut run to the ore body, about 65 feet east of the shaft. The 1200 and 1300-foot levels are in good shape to commence taking out ore. The frame work for a 12x16 crusher is being put up, and will be at work in a week or two, when at least 100 men will be employed.

El Dorado.

D. H. Jackson has bought a half interest in the Lone Star mine. He had a two years bond on the property which had not quite expired and has been pushing the work on the mine ever since last March.

The new mill on the Blanchard mine has started.

Kern.

Californian: A new steel whim, cars and skips have been recently put in at the Olympus mine, Randsburg, to expedite the handling of ore.

A Cripple Creek mining man has purchased the 4-stamp mill at Garlock. It is said that he will at once enlarge it to a 10-stamp mill and add concentrators.

A Los Angeles company has taken a working bond on George Barton's mine at Randsburg and will push development on the property at once.

Mariposa.

In a circular to the stockholders of the Merced Gold Mining Company the directors say: "In our development work on the Mary Harrison location we have opened up a body of ore about 300 feet in length at the 400-foot level. The extent of this body in depth we know nothing about as yet. A mill test has been made, and the following telegram has just been received from the mine: 'Mill returns show from the Mary Harrison 139 tons of ore treated, the yield being $1039 gold, and one ton sulphurets, having assay value of $94.05. This shows a yield of about $8 per ton of rock treated.'"

Miner: The resignation of Captain Thomas Couch as manager of the Merced Gold Mining Company has been accepted. John R. Gilbert has been appointed as manager of the Merced Company here, and has returned to Coulterville to assume charge. Captain Couch accompanied Mr. Gilbert and will remain for several days. The Captain is a heavy stockholder in the Merced Company, and will remain as one of the directors. He will leave for Mexico shortly to assume charge of mines being operated there by an English syndicate.

E. C. Loftus has bonded the Jeffrey mine and the Ruby, an extension of the Jeffrey. These claims are south of the Mary Harrison.

Colonel Haskell has his new 5-stamp mill on the Little Wonder about completed. The Little Wonder was bonded from Mr. Raggio of Big Oak Flat.

The Never Sweat mine, owned by Ballentine, Rucker & Fisher, is showing up some good ore. Sinking in the old shaft has been resumed, and the ledge matter shows considerable free gold.

Nevada.

Union: A cleanup for ten day's run with a 5-stamp mill at the Pennsylvania mine amounted to $4500 and it is expected that the month's yield will be $12,000. The monthly expenses are $1500. Last month the total yield was about $8000, from 200 tons of ore. The company had $6000 in its treasury before the last cleanup.

At the Brunswick a rich ledge has been found on the 900-foot level. Its size has not yet been determined, but it is at least 3 feet wide.

After long years of idleness the Kentuck mine is now destined to be worked. The machinery has been ordered and in a short time it will be placed on the ground. L. P. Goldstone is managing the affair and Jabez Howes is president of the company. The Kentuck is north of the Idaho mine and has long been regarded as one of the best places in this district to spend money on with the view of developing a valuable property.

Placer.

Colfax *Sentinel*: Owing to the death of Mr. Borland, one of the owners, the Sacramento gravel mine on the Forest Hill divide will be sold. The claim comprises 144 acres. The tunnel has been run 1500 feet.

The eighth installment of the Blue Canyon Mining and Development Co. has all been paid, and installment No. 9 has been called for.

The 20-stamp mill at the Mayflower gravel mine, near Forest Hill, is running steadily.

A new six-ton boiler and furnace has arrived at Colfax for the Pioneer Mining Co.

The company which owns the Emanuel Polifka ledge above Westville has finished hauling in forty-two tons of machinery and supplies. They will try to build a sawmill yet this winter.

The big tunnel of the Eureka drift gravel mine, Forest Hill divide, is in 1740 feet. For the last 350 feet the tunnel is principally in quartz. The company is cutting across an enormous vein.

Shasta.

Searchlight: The Mountain Mines, Limited, are now employing between 500 and 600 men. The second smelter of the water jacket pattern will be ready to start up in a few days. The first smelter, which has a capacity of over 150 tons a day, had fires drawn Sunday for the first time since it started up, the beginning of September. These smelters are a success in every way and the ore is being treated in an economical manner. Before the beginning of the new year they will be in operation and four more will follow immediately, making a total output of not less than 1200 tons a day. The company is having constructed a large number of cottages for the men employed who have families. The new hospital building will soon be under way.

Rich ore has been struck in the Little Susie mine, situated four miles from Shasta, on the Weaverville road. The width of the vein averages 4 feet.

The Hard Scrabble gravel mine, southeast of Igo, has been sold to a Chinese company of San Francisco.

Mining interests in Lower Springs are perceptibly stimulated of late and development work is being actively prosecuted on many prominent ledges.

A party of men have secured a lease on the Gypsy mine, on Salt creek, and will commence to take out ore in a few days.

E. P. Conner is developing some properties on Salt creek.

W. Ikard will commence work on his placer claim when rain sets in.

The owners of the Last Chance mine have finished a 600-foot tunnel which was run to tap the chute of ore, and are getting out some good rock.

Work will be commenced on the Old White Oak mine in a few days. This property has quite a record as a bullion producer, but has been idle for a long time on account of the death of owners.

Sierra.

Marysville *Appeal*: The manager of the Alaska mine has gone to Scotland, whence he is expected fo return soon with the necessary funds to construct a tunnel into the ledge from Oregon creek, thus obviating the trouble with water that the mine has experienced in the past.

Mountain Messenger: The Gold Bluff mine is now in the hands of C. D. Lane and Alvinza Hayward, W. V. Lockwood having bonded it for them. Mr. Lockwood has taken charge of the property, and will first put the electric plant in working order, preparatory to pumping out the shaft.

For some time past Mr. Costa has had a number of men employed at the mine in the works above the shaft extracting ore, which is now being delivered at the mill. The mill, in charge of Emil Loeffler, will be started running this week, when all the ore now on hand will be crushed.

The South Fork Company have struck the shaft in the old Live Yankee mine.

The North Fork Company is expecting any day to tap the incline of the Uncle Sam mine.

The gravel struck at the Lucky Dog mine is reported to prospect well.

Siskiyou.

Yreka *Journal*: Over on the Salmon the miners in river claims were driven out by the high water, the river being nearly as high as at any time last winter.

The Gold Run mine owners have struck the ledge in their new tunnel, now driven in about 1100 feet, and it is very rich.

The Black Bear is still running on good ore. They recently struck another rich body of good quartz.

The Gold Ball mine is still shut down, and, from all indications, will not start up very soon.

Wm. Burns will soon put on a full force of men to rig up his claim.

Smith & Hamilton are preparing their mine for the winter run.

The Erno 5-stamp quartz mill has been completed and will soon be put in operation.

Dr. Simon of Redding has been making arrangements for starting up the Nannetta B. mine on Thompson creek. This is the old Ben Shinar mine, which was purchased some time ago by Leadville, Col., capitalists.

At the Schroeder mine, on Deadwood, they are running a tunnel which will tap the ledge at a depth of 1000 feet.

The rains of the past two weeks have furnished plenty of water for the smaller placer claims, which have been started up.

News: The affairs of the Ball mine, which have been tangled up in litigation for some time past, are about to be amicably settled. Mr. Ball has reached an agreement with the Eastern stockholders whereby he will pay all liens against the mine, amounting to about $14,000, after which he will have full control of the property and will resume work on a large scale.

Dannenbrink Bros. of Hungry Hill are running a lower tunnel in the Gold Run mine, which is now in 1100 feet and will be pushed about 900 feet farther. They have tapped a 2-foot ledge 300 feet below the present workings where the ledge is not so wide, showing that the body of ore is greater as depth is attained.

Biglow brothers have had a successful season working their claim eight miles below Sawyers bar.

Colstein & Thrash are working a ledge on Humbug which averages 16 inches in width and yields ore milling about $12 per ton.

Harris brothers have started up their mine fourteen miles below Sawyers bar.

Trinity.

Journal: On the Stuart Fork side of the La Grange Company's tunnel twenty-five men are employed, but slow progress is being made at present, owing to the hard rock which has been encountered. It will probably take twelve months or more to complete it. Almost three miles of flume have been built. The flume when completed will be nearly eleven miles in length, to which will be added a mile of pipe line. The tunnel when finished will be nearly two miles in length.

On the East Fork the placer mines are getting ready for the winter.

The Golden Chest mine, which has been idle for several years, is now being worked.

Skinner & Barkla of the Yellowstone mine have a big ledge of good milling rock, and will soon start up their 10-stamp mill again.

Thomas Nicholson and Philip Kleckner, who

recently leased the Poor Man mine, are taking out ore, and will soon have a good crushing ready for the mill.

Journal: James Mayberry, superintendent of the North Star mine, has a big ledge of good rock opened up in shape to work, and is keeping the 10-stamp mill running steadily with a small crew of men.

At the Enterprise the ledge, especially in the Lone Jack location, is looking better than ever before. The company are now working a winze on the ledge in their 250-foot tunnel, and the water is being drawn out with a syphon. The ledge shows free gold, and is getting bigger as it goes down.

Tuolumne.

Independent: It is reported that the Experimental mine, owned by Engelke & Co., will be opened up shortly by a San Francisco company.

The new chlorination works at the Star mine are proving satisfactory.

At the Golden Gate mine the mill has been started up again.

The mill has been started up again at the Belleview mine, after being closed down for a month. The new pump is in and is the largest in the county.

The new hoist at the Soulsby mine is at work and will be fully under cover within three weeks.

Yuba.

Marysville *Democrat*: Men have gone to Dobbins ranch, Yuba county, to erect a hoisting works on the Eagle mine, which adjoins the Good Title, and is under bond to the Good Title Company. It has been worked for some time in a small way, and the new company contemplate extensive operations. There is a 7-foot ledge in sight, and it looks well. The company hope to have their new works completed and the pump running by January 1st.

NEVADA.

Reno *Gazette*: Joe Farren, who is representing a strong English syndicate, has arrived at Golconda with ten miners to go to work on the Adelaide copper mine, ten miles south of Golconda. The Adelaide is a fine copper prospect, and the Englishmen intend, if the mine proves as rich as they think it will, to put up large concentrators at Golconda and work 500 or 600 men. Mr. Farren will put on a force of about twenty-five men next week to do the prospecting. He is also operating at Cherry creek, White Pine county, on the Star and Grey Eagle, for the same company. He is working about twenty men in White Pine.

White Pine *News*: Will Bliss of Carson has been making an examination of the Chainman mine for San Francisco parties.

The mill of the North Mountain Company at Cherry Creek is running regularly on ore with the cyanide process. Recent reports are to the effect that the cyanide is saving all the gold and 70 per cent of the silver.

NYE COUNTY.

W. H. Bray, one of the owners of the Ione Gold Mining Co., says that the new gold mill recently erected by the company near Austin is a success, and that the amount of bullion saved from the ore was gratifying, 92 per cent being saved on the plates and 6 per cent being in the concentrates. The mill is being run under the management of E. W. Brownell. The mine is looking well, with high-grade gold ore in sight. The mining property now being handled by this company has laid idle for years. Eight months ago W. H. Bray saw that it was valuable, formed a company, and by able management the promoters have insured the enterprise a paying affair from the start.

OREGON.

BAKER COUNTY.

At the White Swan a 12-foot vein of ore has been uncovered in the 400-foot level and the mill will soon be started up again.

Eight men are at work on the big placer mines near Woodley, making preparations on a more extended scale than ever for next season's work. The main supply ditch has been increased nearly one-third in size, and an additional pipe will be put in operation on Carson hill. Another pipe will also be worked in Tanner gulch.

W. J. Clark has disposed of his interest in the Union-Companion mines, which are now entirely owned in New York.

JACKSON COUNTY.

J. W. Robinson of Wimer has commenced work on his placer mines in Brass Nail gulch with a large force of men.

The lost channel of Humbug creek was struck in John Bolt's placer mine last week and $13.11 was washed out of the two wheelbarrow loads of dirt from the drift.

Allen Lewis has a large force of men engaged at the mines on Grave creek, formerly owned by the Taylor Mining and Milling Company, extending the ditch and putting in new pipe.

JOSEPHINE COUNTY.

A rich strike is reported to have been made in the Renshaw Consolidated mine. An assay is said to have been made which shows $83 per ton in gold.

George Dorwin has five men at work on the Jewett mine. Some large bodies of ore have been exposed.

The Griffin Mining Company of Sardine creek is having milled some ore which nets about $40 per ton. The ledge is about 3 feet wide.

William Edwards, a mining expert from London, England, and Benjamin Bullard, formerly superintendent of the Squaw Lake Mining Company, have been inspecting the Denver City ledge.

WASHINGTON.

Spokane *Chronicle*: The Golden Triangle Gold Mining Company has been organized to work the Golden Triangle mineral claim in the Twisp district, Okanogan county. The claim has large bodies of very rich ore, some of the assays running as high as $600 per ton in gold and copper.

The Red Shirt mine has a 20-stamp mill in operation and the company have expended fully $75,000 in machinery and development work during the past summer.

BRITISH COLUMBIA.

Spokesman-Review: The British Canadian Gold Fields Co. has let contracts for considerable development on their properties on the north fork of Salmon river.

The Slocan Star has at present on its payroll 130 men, 70 of whom are employed in the mine.

At the Noble Five the owners expect to take 100 tons of ore daily.

The output from the Rossland mines during October was the largest in the history of the camp. The amount sent to the smelter aggregates 5037 tons, divided as follows: Le Roi, 3400 tons; War Eagle, 1240; Evening Star, 27; Poorman, 120; Josie, 225; miscellaneous, 25. It is expected that with the machinery now installed and additions being made at some of the mines the production will be enormously increased during the coming year. The Le Roi alone, it is said, with the additional machinery will produce 500 tons a day. The War Eagle will add to its production, and the Josie will be in a position to materially increase its output. There are twelve or fifteen mines which are employing machinery in development.

Spokane *Chronicle*: At Grand Forks three mines, the Bonita, Grand Forks and Grey Eagle, have started active operations.

At Ainsworth the Little Phil mine is under bond to N. Clark Wallace of Toronto.

CANADA.

Toronto *World*: In the Lake of the Woods district the principal vein in the Scramble has been traced 1500 feet. The mine was purchased as a prospect for $7000. A shaft and crosscut show 38 feet of $15 ore.

The Mikado mine was purchased some time ago by Col. Ingleduce for $25,000. There are at work twenty three men. A lot of 140 tons worked yielded $8000.

The Yum Yum, adjoining the Mikado, was lately sold for $25,000 to an Ottawa syndicate.

On the Sultana the shaft is now down 330 feet, and ore is being taken from the third and fourth levels. The vein varies from 35 to 50 feet in width. Fifty men are employed, and a 10-stamp mill is running regularly. The value of the output is about $10,000 a month.

On the Regina the shaft is down 200 feet. A 10-stamp mill has been running 13 months. A cyanide plant is being put in.

UTAH.

Bingham *Bulletin*: Quite an increase in ore movements is noticeable. Among shippers are several of the Niagara Company's mines, including the Live Pine (two leases), Utah and Indiana; also the Northern Chief, 100 tons, and a lot from one of the Turngren group. During four days the shipments from the Old Telegraph averaged about eighty tons per day.

Superintendent Gebhardt reports the outlook at the Phœnix group is of a satisfactory nature, and there is no doubt that the strike lately made in the Coramandel mine is important. The 600 tunnel from the Carr fork side, through which the group will be ultimately worked and which has been run 1400 feet, is expected to tap the main vein in another 200 feet.

Monroe Salisbury has transferred his interest in the Mayflower to Chicago parties.

Park *Record*: The Vallejo has a 7-foot breast of ore that will yield over $100 per ton. An average sample taken across the breast yielded the following results: Silver, 8 ounces; copper, 16 per cent; gold, 3.8 ounces; value of gold, $63.85.

The Ontario Company has gone below the drain tunnel and found over 20 inches of ore showing 150 ounces in silver and 25 per cent lead. The vein, at the point where the ore was encountered, carries all the marks of being permanent, and Mr. Kervin is satisfied that he has demonstrated beyond a doubt that the Ontario is greater still. The winze is now down over 90 feet and the ore increases in width with depth.

Salt Lake *Tribune*: F. F. Frisbie and associates have acquired control of the Zelnora mine at Bingham. The purchasers will at once begin active development work.

Thomas Lloyd, the State Mining Inspector, says that while a large number of properties have suspended the production of ores, owing to the price of the metal market, a number of new ones have started up and there are probably as many men afforded employment as at the corresponding period last year. At Bingham the decline in lead has worked serious loss to the shippers, while the same thing has occurred at Park City. In the camps of Tintic the gain in the percentage of gold that has continued to increase as depth has been attained, has made it possible for the older mines to continue their output, and that it does exist in such abundance has inspired the development of much new ground. He predicts an increased amount of work in all the mining camps during the next few months, and more especially in those where the gold ores predominate.

The property of the Shoebridge Bonanza is to be systematically developed under the direction of Mr. George H. Robinson, who has done so much to disclose the riches of Tintic. It is the result of a deal in which Mr. Robinson and his friends acquire a half interest in the property.

At Mammoth the bids received for sinking another 100 feet on the Apex shaft have been opened and the contract let.

At Mercur the strikes in La Cigale and Omaha have caused great excitement, for they open to the miner and prospector a new area of mineral territory larger than the whole gold district of the Rand, South Africa, and a larger area than has already been developed from the Sunshine on the south to the Northern Light on the north.

The strike in La Cigale was made in the shaft at a depth of 50 feet, and assays from $1 50 to $17 were obtained; averages of 9 feet gave from $7 to $10, while averages of certain parts of the vein run much higher.

A large amount of cinnabar ore is being encountered in the west drift of the Gold Dust. This ore is always high grade, and is regarded as an indication of the continuity and permanence of the vein.

Judge Harris, representing Eastern people, has secured a thirty-days' bond on the Potomic, Chesapeake, Arctic, Rappahannock, Delaware and Green Mountain claims, in the vicinity of Lion hill, for $25,000.

Col. O. B. Hardy is arranging for driving a tunnel into the properties of the Bingham Copper Company, and to tap the vein will be compelled to go a distance of 1900 feet. The tunnel will tap a number of properties, and will afford an economical outlet for everything upon its line.

The Sioux-Ajax tunnel has now penetrated the ore zone for a distance of nearly 1400 feet, and predictions are made that ore will be encountered within the next thirty days.

MONTANA.

Inter-Mountain: Work has been resumed at the Hope mine at Bison for the first time since the fire, when several men lost their lives by asphyxiation. The mine is owned by Philadelphians. A force of men is now at work erecting a concentrator, which will have a capacity of treating 250 tons of ore a day.

The Boston News Bureau says: "It is said that Messrs. Lawson, Weidenfeldt & Co. have secured an option at $5 per share on the 90,000 shares of Butte & Boston stock held by the Davis estate, and that Captain Couch will be engaged to manage the property, but Butte & Boston people say that the 90,000 shares of Davis estate stock are so tied up in litigation that no one can have an option upon them."

WYOMING.

The parties who leased 600 acres of placer ground on the Muddy, a tributary of Douglas creek, from the Douglas Consolidated Placer Company, have completed 1000 feet of bedrock flume, 4500 feet of ditches and 600 feet of fluming; they have purchased and put in place 550 feet of iron pipe running from 20 inches down to 8 inches in diameter, also all the necessary hose and other material, and will commence active operations as soon as the season opens in the spring. A test of the ground 15 feet wide, 48 feet long and 7 feet deep gave 195 pennyweights gold, very coarse, several of the nuggets weighing from 4 to 8 pennyweights each.

Arrangements have been perfected for the erection of a placer plant by Mr. Crysler on his Rock creek placer property, the price being $15,000.

Several important discoveries have recently been made at the head of Cow and Spring creeks that show well in free gold.

At Rock Springs the Union Pacific mine No. 8, which has been idle for some time, resumed operations last week, and will give employment to a large number of coal miners. All of the mines in the camp are now working regularly, and the prospects are bright for a prosperous winter.

A carload of mining machinery has been received at Rock Springs for use in the South Pass placer fields.

SOUTH DAKOTA.

Black Hills *Times*: The Metallic group, consisting of six claims in Ragged Top camp, is being developed by Hattenbach Bros., who recently purchased a one-fourth interest in the group from the original locators.

The owners of the Apex property near Rochford are putting in a big engine to replace the water power which had heretofore been relied on.

At the Tornado the product averages 140 tons per day.

At the Kicking Horse group of mines on the Blacktail divide all the ore shoots so far opened are of good grade, assays ranging from $20 to $114 gold per ton, the average value being between $30 and $40.

At the Norwich lode they have opened up a vein of ore that assays from $100 to $425 gold per ton. The vein is 4 feet wide and is capped with a 10-inch stratum of soft talc that assays $90 per ton.

Ragged Top camp now bids fair to become the richest district in the Black Hills. At the present time the ore shipments to outside smelters average 100 tons per week, which net the owners from $35 to $122 per ton in gold.

COLORADO.

Denver *Republican*: At Cripple Creek the Pennsylvania syndicate that has been developing the South Park, on Ironclad hill, during the last six months has made its first payment of $10,000 on its $55,000 bond, and stands prepared to complete the purchase of the property as the payments of the bond fall due.

Tutt & Penrose are producing an average of fifty tons a week from their work on the Geneva on Gold Hill, the ore ranging from $30 to $60 in value.

The Foley lease on the Lillie on Bull hill continues to turn out ore at the rate of thirty tons a day, and new ore houses are being erected in order that winter will not interfere with the production.

Once more the Bogart on Raven hill is coming into prominence. Two years ago it was a sensation. Ish and Hayes secured a lease a few weeks ago and began prospecting the old workings. Where the upraise connected with the old shaft the story of the past failure was told. Instead of working on the vein from which the ore came the company had done its work on a secondary vein that had cut the rich one squarely in two at a depth of 40 feet from the surface, and on the hanging walls of the intruder was lying the ore of the vein worth mining.

R. D. Kinney is shipping between sixty and seventy-five tons a week from his lease on the Lady Stith, located on Globe hill, and owned by the Gold Crater Company.

The Belle of the West, a prospect on Straub mountain, has been sold to a company formed of Chicago police officers, for, it is said, $25,000.

The machinery plant of the Cripple Creek and Gold Hill tunnel will be ready for operation in a few days, and in the meantime the contractors are driving the tunnel by hand. A large area of unprospected territory will be opened by the work between its mouth and the Moon-Anchor vein.

Production from the Moon-Anchor last week amounted to 125 tons, 80 of smelting and 45 of mill ore.

The Elkton shipped twelve broad-gauge carloads last week; four of high grade, four of second smelting grade and four of mill ore.

The Raven output was seventy-five tons of ore, and ranging from $30 to $100 a ton in value.

At Victor the Granite, on Battle mountain, has made a shipment of four carloads. One of them is high grade that may run up to $500 a ton.

The Alliance Company is arranging to resume development on its group on the south slope of Big Bull mountain.

The crosscut from the 277-foot station in the Legal Tender shaft of the Golden Cycle Company has reached the vein and finds it to be fully as rich and as wide as in the upper levels. The property is producing an average of thirty tons of ore a day.

At Telluride the Tom Boy mine is producing the most gold and paying the largest dividends of any mine in San Miguel county. The mill, comprising eight Huntingtons and fourteen vanners, treats from 140 to 175 tons of ore every twenty-four hours. The bulk of the milling ore yields as high as $40 per ton in gold.

The concentrating capacity of the Japan mill is about 150 tons of ore daily, which being reduced three and four tons into one, gives about fifty tons of concentrates that average from $100 to $125 per ton in gold, silver and lead.

The Columbia-Menona crosscut tunnel, which has been in progress for more than a year past, is in 1040 feet, with another 260 more to drive to intersect the vein 450 feet below the lowest of the upper workings. It is expected the tunnel will be completed by the 1st of January.

On an average the mill at the Smuggler-Union has been treating 175 tons per day and shipping from 80 to 100 cars of concentrates per month. Nearly 300 men are on the payroll of the company.

During October, 298 carloads of ore, aggregating 4,768 tons, were shipped from the Black Hawk depot. Compared with the corresponding month of 1895, this shows an increase of 110 cars.

The Newhouse tunnel is progressing at the rate of 300 feet per month. It is 12x12 feet in size.

One of the most promising of the recent copper discoveries is the Mule Skinner claim in Magnolia district, Boulder county. A vein of between 4 and 5 feet in width has been opened by a 50-foot shaft. The first-class material assays 10 ounces in silver, $10 in gold and about 70 per cent copper. This streak is from 10 to 11 feet wide. The matter from entirely across the vein returns a value of about $40 in gold, silver and lead.

In the Red Cliff district a tunnel is being driven into Battle mountain by Joseph Hill to develop a large tract of mineral land owned by Denver capitalists. The tract embraces 500 acres of valuable silver-bearing mineral and a lease and bond has recently been secured on 200 acres adjoining. The tunnel will be driven 6000 feet, and in its course will tap a number of veins which have already been developed at the surface.

NEW MEXICO.

The Treasure Mining Company is working about fifty men at the mine and mill. The main shaft is down 312 feet. At a depth of 186 feet a drift was run 950 feet south and a large amount of ore extracted. At 300 feet in depth levels have been run 400 feet south and 150 feet north. The mill is kept running steadily on the ore produced.

The Golden Giant Mining Company is working about forty men in the mine and mill.

Every mine in the Mogollon district which has reduction facilities is shut down, except the Confidence. The Confidence mill on Whitewater started crushing ore, with twenty stamps at work, Thursday, the 12th.

ARIZONA.

GLOBE DISTRICT.

(Special Correspondence).—The Gerard Mining Co. have their new 10-stamp mill about ready to begin pounding quartz. W. B. Gerard of New York, the president of the company, arrived just in time to see the stamps drop for the first time and will stay till the first cleanup is made.

At the Black Copper group of mines, Supt. W. W. Hill has men building roads and grading for the smelter. A new hoisting plant and 125-ton furnace will soon be in place.

The O. D. C. M. & S. Co. started another furnace a few days ago, thus giving employment to several more men at the smelter. This company is producing more copper than it ever did before and is still enlarging its works.

At the United Globe mines, Supt. E. H. Cook is pushing the new smelter to completion and will have everything running in full blast by the first of the year.

In the Green Valley mining district the gold mines are coming to the front. This district was organized years ago and a little prospecting was done on the surface. Among the curiosities is a shaft 18x18 feet inside the timbers that is down 65 feet. Recently practical miners got into the district and have resumed work in a business-like way, most of them being at work on good free-milling ore.

The most promising claim in the district at

present is the Golden Wonder, Birchett & Chilson owners. They have just finished a run of forty tons with J. I. Coleman which gave them 209⅛ ounces gold in return, 75 per cent of which was caught in the battery. This mine always was considered a bonanza, but of course it had its streaks of lean as well as of fat. However, the owners seem to understand their mine and make it average exceedingly well. They have always had some rich ore in reserve to fall back on when the next "streak of fat" did not come in as soon as expected; but of late they have had fat all the time, having had 18 inches of ore for the last 70 feet in the shaft.

Lockwood & Looney have men at work on the Gold Field. They have about fifty tons of ore on the dump, which, according to the last mill-run, assays about $85 and plates from $35 to $40.

E. E. Wann of Denver, Col., is pushing work on the Mazatzal group of copper claims, which he recently bonded from Bissig & Wentworth, and is much encouraged with the results of his work and says he expects to have a modern smelter on the property before July. W. H.

Globe, Arizona, Nov. 23rd, '96.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING NOVEMBER 17, 1896.

571,510.—WATER WHEEL BUCKET—A. Chavanne, Grass Valley, Cal.
571,646.—TEMPERING COMPOUND—Clark & Neill, Portland, Or.
571,649.—STREET SPRINKLER—Cross & Hill, Los Angeles, Cal.
571,652.—DESK—W. T. Dodd, Prescott, Wash.
571,665.—TOBOGGAN—H. P. Herron, Los Angeles, Cal.
571,529.—FOLDING BED.—H. G. Krasky, S. F.
571,679.—CONVERTING MOTION—V. & M. McCullough, Veronica, Or.
571,730.—ELEVATOR—J. Parkinson, Los Angeles, Cal.
571,731.—ELEVATOR ENGINE—J. Parkinson, Los Angeles, Cal.
571,732.—HYDRAULIC ELEVATOR—J. Parkinson, Los Angeles, Cal.
571,394.—BICYCLE HANDLE AND BELL—Prindle & Lampton, Woodland, Cal.
571,456.—MUCILAGE BOTTLE—C. W. Reeves, Los Angeles, Cal.
571,627.—CAN SOLDERING MACHINE—N. Troyer, Astoria, Or.
571,628.—PROPELLER—W. M. Tucker, Nelson Point, Cal.
571,736—AIR BRAKE—H. C. Zenke, Sandy Point, Wash.
26,310.—DESIGN FOR TYPE—W. F. Cornell, Alameda, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

FOLDING-BED.—Henry G. Krasky, San Francisco. No. 571,529. Dated Nov. 17, 1896. The object of this invention is to provide a simple and effective folding-bed which may be opened out for the purpose of a bed and be free from any tendency to fold or double up, and when closed it constitutes a chest of drawers or other desirable furniture. It consists of a base frame, a head section and a foot section hinged separately and directly to the said frame and mattress stretched between the sections lying in a plane below the hinge centers of the sections, a hinged leg upon the upper portion of the front of the foot section, and means for locking the leg when the section is in a horizontal position comprising a pivoted latch on the leg, a pin in the section with which the latch engages, a pivoted lever and a means for releasing the leg from the locked position.

Brooklyn Hotel,
208-212 BUSH STREET,
SAN FRANCISCO, CAL.
Conducted on Both the European and American Plan.

This favorite Hotel, located in the best and most central portion of the city (being in the same block as the Mills Building and immediately adjoining both the Telephone Building and the First National Bank), is under the experienced management of CHAS. MONTGOMERY, and is as good, if not the best Family and Business Men's Hotel in San Francisco. Electric return call bells in rooms.

Board and Room per day $1.00 to $2.00.
Board and Room per week $6.00 to $12.00.
Single Rooms, 50 cts. to $1.00.
Family Rooms, $1.00 to $1.50.

FREE COACH TO AND FROM THE HOTEL.

GOLD MINING PROPERTIES.

Having thoroughly canvassed this section of country during the past seven months, I am enabled to furnish valuable information to capitalists desirous of bonding or purchasing meritorious mining properties in El Dorado county. Prospects, partially or wholly developed properties, or purchasable interests ready for operation but lacking capital, can be had on favorable terms. Address, A. E. HAMILTON, P. O. Box 66, Placerville, Cal.

Over 300,000 Tons of Gold Ore

Practically in sight in the MOORE HILL MINE, above our millsite. No hoisting. No pumping. Worth millions of dollars. Just to tap this body of ore and erect modern milling plant, we will sell limited number of shares at $1, payable 10 cents monthly each. MARIPOSA GOLD CO., No. 3 California St., Room 61.

THE NEW GOLD FIELDS OF
British Columbia.
How to Reach Them Most Easily.
What to See. Where to Invest. Latest Reports.

Correspondence Solicited.

Address BEAUMONT BOGGS, member British Columbia Board of Trade, Victoria, B. C.

WANTED,

A position as Superintendent or Assistant Superintendent in copper-silver or silver-lead smelting works.

Understands mining, sampling, assaying, furnace management, handling men.

Prefer Mexico or Spanish South America. Speaks Spanish. Best references.

Address METALLURGIST, this office.

WANTED.

A Large Gold or Copper Property, located anywhere from Alaska to Mexico. Must have ore body developed 200 to 300 feet deep, with a large amount of payable ore actually in sight. Or a property with a large body of payable ore exposed sufficient to warant extensive development work. No small property wanted. Send complete description to M. KUHN, 12 Front St., San Francisco.

WANTED.—A 1 Mine Superintendent. State references and salary expected. Address 37, this office.

DEWEY & CO'S
Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. patents since 1872. All worthy inventions patented through Dewey & Co's Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior.

Advice and Circulars free.

DEWEY & CO., Patent Agents,
220 Market St., San Francisco.

IMPROVED MINERS' LANTERN.

Gray's Harbor Commercial Co., Cosmopolis, Wash., state:
"We have never used any other than AIDION since we have carried same in stock, and further, that we have babbitted up the 'Thrust Box' on one of our steamers, where nearly every other kind of Babbitt had been used. In every case it had been unsatisfactory, but since putting in the AIDION we have had no trouble in any way whatever."

K. J. McHUGH, Successor to the Adkins Manufacturing Co.
51 FREMONT STREET, SAN FRANCISCO, CAL.

HORACE F. BROWN, CONSULTING ENGINEER.

Special attention given to preparing plans for the Chlorination and Bromine Processes of Treating Gold Ores.
PATENTEE { Brown's Complete Automatic Mill Process. Brown's System of Mechanically Stirred Roasting, Cooling and Conveying Furnaces. Etc.
1607-8 Manhattan Building, Chicago, Illinois.

The General Gold Extracting Co., Ltd.,
PELATAN-CLERICI PROCESS.
Patented in U. S. and Other Countries. Capital, £100,000.
London Head Office.....8 Drapers Gardens.
Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.

This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.
Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.
F. CLERICI, Manager for U. S.

KENDALL GOLD AND SILVER EXTRACTION CO.
THE KENDALL PROCESS is the most efficient method of using cyanide for the extraction of precious metals from their ores. Wherever this process has been adopted the result has been increased percentages of values recovered and saving of time. Material reduction in consumption of chemicals has also been demonstrated with respect to several classes of ores.
All ores, without exception, amenable to cyanide treatment can be treated to better advantage by the Kendall Process. This can be accepted as an axiom.
The manager of one of the largest mines in the Mercur District, Utah, wires: "We now begin to understand dioxide process; last twenty days treated 220 tons per day of $26.50 ore, average of all tailings samples $0.83."
Owners of mines and reduction works can obtain full information on application to
KENDALL GOLD AND SILVER EXTRACTION CO.....47 Broadway, New York City.

Improved Self-Contained Cushion-Frame Five-Stamp Mill.
Patented in the United States and Foreign Countries.

The Improved, Iron-Frame, Self-Contained, Cushion-Frame, Five-Stamp Mill Saves Bills for Heavy Timbers, Millwright and Mechanics' Labor, and a Large Amount of Space. The term "Self-Contained" Means a Great Deal to the Mine Owner, and Can Be Readily Recognized and Appreciated in Making an Estimate For an Ordinary Five-Stamp Plant, When the Comparative Cost is Considered Over a Wood-Frame Mill.

FIRST: There is Saved by the Use of This Mill a Large Bill for Heavy Timbers, in Many Instances Obtained at Great Expense and Loss Of Time.

SECOND: The Saving in Mill-Wright and Mechanics' Labor in Framing and Erecting.

THIRD: The Large Amount of Space Saved.

Late improvements in the amalgamation and concentration of ores enable us to offer to the mining public, in connection with our Self-Contained Mills, an apparatus which amalgamates and concentrates at the same operation and provides a perfect trap for escaping quicksilver. Write to us for information.

Market Reports.

The Markets.

SAN FRANCISCO, Nov. 25, 1896.

General rains the past week in the lowlands and snow deposits on the mountain ranges have a decided favorable effect on business. So far they are considerable in excess of that which fell during the corresponding time last year. In the agricultural districts outdoor work is being vigorously pushed with a strong probability that the acreage seeded to grain, barley and wheat, being from 25 to 30 per cent larger than last season and with favorable weather and good prices this will have a decided beneficial influence on all industry. The snow deposits are favorable for mining, for with the usual deposits during the winter months there will be an abundant supply of water well into 1897. Iron workers, in general, are quite hopeful that next year will witness more activity in foundry machinery and structural material departments than before known on this coast.

The local money market continues to grow easier, with quite an increase in the offerings of outside funds. This improvement in the situation is causing borrowers not to anticipate their wants under the belief that still lower rates of discount will rule the forepart of 1897. The rapidity with which farm products have been marketed, and at generally higher prices, is giving a good supply of funds to agricultural sections. It is stated in financial circles that many obligations have been met which, at one time, seemed as if more time would have to be given. Collections are said to be quite easy for the season of the year, while the trade owes less money.

From the East our advices continue to note a growing ease in the money markets, with more or less pressure to place idle funds. It is quite generally conceded that there will be no exporting of gold for some time at least, which will have a continued good effect on all branches of trade and industries. This opinion is based on official statistics of our foreign trade relations. According to the Bureau of Statistics, the balance of trade in favor of the United States is something unexampled in the history of the country. The balance tended the other way to the time of the panic of 1893. Beginning on July 1 of that year, which was the beginning of the fiscal year 1894, the balance turned and has been heavily in favor of the United States except one month of 1894 and the spring and summer of 1895. The figures of the excess of exports over imports of merchandise were $237,145,950 for the fiscal year 1894, $75,568,200 for 1895 and $102,896,914 for 1896. This affords an aggregate for the three years of $415,611,064. These large exports of merchandise went hand in hand with net exports of gold, amounting to $4,528,942 for 1894, $30,984,449 for 1895 and $80,588,649 for 1896, making a total for the three years of $116,102,040. The excess of exports of silver for the same period was $37,164,713 for 1894, $37,674,797 for 1895 and $46,756,408 for 1896, making a total of $121,595,918 for the three years. From the enormous aggregate of these items to the credit of the United States, amounting to $653,309,022, are to be deducted the net imports of gold and silver ore, amounting to $6,610,146 for 1894, $10,636,896 for 1895 and $15,069,908 for 1896. The net result of these figures was to leave a balance in favor of the United States for the three years ending on June 30, 1896, of about $620,000,000. The first four months of the present fiscal year have added $132,015,469 in merchandise and $17,908,573 in silver coin and bullion, and have shown items on the other side of $54,706,059 in gold imports and about $6,500,000 in imports of gold and silver ores. The figures for four months of the present fiscal year, therefore, add $89,000,000 to the apparent balance in favor of the United States and raise the gross amount for three years and a third to $709,000,000.

New York Silver Prices.

NEW YORK, Nov. 25.—Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.
Friday	29 15-16	65⅛
Saturday	29 15-16	65
Monday	30	65⅛
Tuesday	30	65¼
Wednesday	30	65¼
Thursday	—	—

	Copper.	Lead.	Iron.	Tin.
Friday	11 35	2 97½	11 00@13 00	13 10
Saturday	11 35	3 00	11 00@13 00	13 10
Monday	11 35	3 00	11 00@13 00	13 10
Tuesday	11 35	3 02½	11 00@13 00	13 10
Wednesday	11 35	3 00	11 00@13 00	13 10

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	7@8
Commercial Loans, prime	6@8
Call Loans, gilt edged	6@7
Call Loans, mixed securities	7@8
Mortgages, prime, taxes paid by lender	6@8
New York Sight Draft	10c Prem
New York Telegraphic Transfer	12½c Prem
London Bankers' 60 days	$4.83¼
London Merchants	$4.83
London Sight Bankers	$4.87
Refined Silver, per oz., 1000 fine	65¼
Mexican Dollars	51½@52¼

SILVER.—The market has exhibited continued strength. At times there was a weaker feeling only to be followed by a still stronger tone. By referring to introductory remarks above, it will be seen that the exports from this country have been steadily increasing with about all of the production being taken the last fiscal year. This absorption has depleted supplies to such an extent as to make them better handling. While our exports have increased, there is nothing to indicate that stocks in England and on the continent have increased, but much to warrant asserting they are less now than two years ago.

MEXICAN DOLLARS.—The demand is slow with us, but at the East a fair movement is reported. The market is steady at fairly firm prices.

QUICKSILVER.—The demand is reported slower.

The market is quoted as follows:

Domestic trade, per flask	36 50

For export, quotations are nominal but less than for home.

COPPER.—The market is strong, in sympathy with Eastern and foreign advices. The East reports an improved home demand, with a continued heavy export movement. Late mail advices from New York report that to obtain supplies firm prices have to be paid. Semi-official advices from Europe show deliveries of nearly 11,000 tons during the first half of November, against an average of less than 17,000 tons monthly previously this year. In other words, a phenomenal new supply for Europe has been so closely taken up there, and that less than 200 tons accumulated in a fortnight. The European visible supply on the 16th inst. was recorded as having been 35,580 tons, against 35,440 tons on the 1st inst., and 36,220 tons on September 1st. For the first nine months of the year the exports from the United States aggregate 183,001,123 pounds, against 94,016,878 pounds for the corresponding time in 1895.

Ingot, jobbing	14¼@—
Ingot, wholesale	13½@—
Sheet copper	17 @—

LEAD.—The market is stronger at a slight advance in asking prices. The Bureau of Statistics reports the imports into this country for the nine months ending with September at 120,746,372 pounds in 1896 and 147,777,876 pounds in 1895 and the exports at 77,559,707 in 1896 and 22,543,694 pounds in 1895.

Our market is quoted as follows:

Pig	—	@	3 75
Bar	—	@	4 00
Sheet	—	@	5 25
Pipe	—	@	4 50

SHOT.—There is a good demand for all sizes.

Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 20
Drop, B and larger sizes, " "	1 45
Buck, Balls and Chilled, do, " "	1 45

ANTIMONY.—Our market is quoted at 7¾@8½c in a jobbing way. New York mail advices quote 7¾@8c for Cookson's, 6½@7c for Hallett's and 6⅜@6½c for Japanese, from store.

BORAX.—Owing to strong competition, there has been quite a drop in prices.

The market is quoted as follows:

Refined, in car lots	5
Refined, in sacks	4¾
Powdered, in car lots	4½
Concentrated, "	5

TIN.—There is more inquiry for both pig and plate. The market is slightly firmer.

Pig, per lb	14¼c@ —
Plate, I C coke, heavy, per box	@$4 05
" " light, "	@ 3 95

IRON.—The market is strong with an advance asked but which consumers are slow in meeting. It is stated that the larger consumers bought quite heavily before the advances and therefore will not be in the market for much before well into next year. At the East the markets are reported strong and active with a good home demand and a fair export movement.

AMERICAN.

	To Arrive.	Spot.
Sloss	$21 00	$23 50

Mining Share Market.

SAN FRANCISCO, Nov. 25, 1896.

The market has been fairly active, with better prices ruling for the middle shares, in sympathy with a stronger tone in Chollar. This improvement has been largely counteracted by reports of pending assessments by the Con. Virginia and Hale & Norcross companies, the closing down, temporarily, of Crown Point and fewer men at work in the other Gold Hill mines. The strength in the Chollar shares is said to be due to the character of the work in the mines on the Brunswick, and also that a crossdrift is to be started on the 400-foot level to run for the downward continuation of the ore found above. This makes the shares a gamble; but it is to be feared that if reported expectations are realized the public will come in as buyers and send prices above the parity of their true value, and if this does take place it is only a question of time when they will recede to their legitimate value based on ore in sight, with a fair value for the probability of finding more. Although this is the midwinter holiday season, when there is more or less demand on the general trading public for expenditures, which makes it hard to promote an up move, yet there are those who think that the small pool-combine will succeed in bringing about slightly higher prices before the close of the year. If this should take place it will prove an exception to the course of the market in former years. So far as the writer can see and learn there is nothing to warrant asserting that large moneyed men are in the market, but, while saying this, there can be no doubt of their watching with close interest the work under way on both the Brunswick and Comstock lodes, with a view of coming in if a body of good, high-grade ore, mostly gold-bearing, should be developed. The continued easing of the money market and steady influx of persons from agricultural and mining sections are favorable to the pool-combine being able to unload, if so desired, at better average prices than rule at present.

Advices from the Brunswick lode are essentially unchanged so far as the general character of the work in the different mines is concerned. The improvement in the formation of the material on the 400-foot Hale & Norcross and Chollar mines is quite encouraging. On the latter level the porphyhry is softer and more greenish, which cause mining men to be quite hopeful of better results as work is pushed ahead. There is another favorable factor, viz.: as the south drifts are pushed toward Potosi there is said to be a steady improvement. Aside from the above the shaft in Hale & Norcross' ground will be at a sufficient depth within the next two weeks to begin work to open up the 500-foot level. If this level should show an improvement over the 400-foot then mining men think the legitimate market value of the shares ought to be fixed at a slightly higher value than rules now. In Occidental they are pushing work on the lower levels heretofore mentioned and at the same time preparing to go still lower so as to open up the 900 or 950-foot level. There is no particular change reported the past week in the material encountered. In Chollar they are extracting ore from the upraise on the 300-foot level. They are also preparing to crossdrift on the 400-foot level for the downward continuation of the ore found above. Unless the latter bends somewhat it is expected that it will be struck at about 40 feet. In Hale & Norcross the shaft is being sunk to the 500-foot level and the crosdrift on the 400-foot level is pushed ahead. In Savage, Gould & Curry, Best & Belcher and Con. Virginia there is nothing new to report as to the work. So far mining men seem to be greatly encouraged for the ground appears to be quite favorable, it being softer with more stringers cut and the general formation an improvement which makes them quite hopeful.

From the Comstock lode there is very little of interest to report. In prosecuting work in Alta an improvement is reported in the drifts on the 725-foot level. In Overman exploiting work is still the order. A few tons of ore are raised each week, but not enough to pay expenses. In Seg. Belcher and Belcher there is a falling off in the number of tons raised each week, owing to fewer men being at work. Where they are working is still a mystery to the public. They expect to resume work in Crown Point before long. From Yellow Jacket no news is allowed to leak out. In Confidence, Challenge, Con. Imperial, Alpha and Bullion the usual work is reported with, seemingly, no desire to strike much, if any ore. In Potosi exploiting and dead work are still the order. Better things are expected to result from work on the west croppings than from work on the 450-foot level. In prosecuting work in Chollar 126 tons of ore were raised and milled last week which gave a battery assay of $6.37 in gold and 10.68 ounces fine of silver to the ton. This barely pays expenses. From Hale & Norcross nothing new is reported. Savage milled 246 tons of ore from which they got $4,471.48 in coin. Hale & Norcross at about the same time milled 134 tons of ore which returned in coin for the gold ore $3,414.12 and left 3,255.88 ounces of fine silver to be sold. The work in Gould & Curry and Best & Belcher is to the east from the Bonner shaft. Active preparatory and exploiting work is continued in Con. Virginia on the 1750-foot, 1650-foot and 1000-foot levels. An improvement is reported on the two latter levels. The number of tons of ore raised and assay value show a falling off. From Ophir, Mexican, Union, Sierra Nevada, Utah and Andes nothing of importance comes to hand. The work is on the same levels and direction heretofore reported, with no particular change in the formation of the material encountered.

Under date of the 18th, Frank H. Pettingell writes from Colorado Springs, Col.: "The mining stock market is at present suffering from an acute attack of reaction arising from various adverse influences, chief of which is the absence of Eastern orders. It is true that directly following the election there was a sharp advance caused by heavy buying, but the purchasers did not represent strong interests and were buying in the anticipation of large Eastern orders, which have not as yet put in appearance, and probably will not until after the holidays. There is an increasing demand for producing mines, for stocks that are being actively operated; but it would appear that the period for the disposal of stocks representing claims on the outskirts of the Cripple Creek district is passed. People show a disposition to buy stocks in mining companies in the hope of an early declaration of dividends, and do not show any inclination whatever toward prospect stocks. Without question, the reign of promoters and the inventor of wild-cat propositions is passed. What people want at present, and will continue to in the future, is mining stocks in the strictest sense, and their purchasing orders will be based on production, and not on localities. There had to be some limit to the expansion of Cripple Creek; and although there

Recently Declared Mining Dividends.

The Idaho Company, Slocan, B. C., declared and paid a dividend of $20,000 on the 14th inst.

Homestake Mining Company, South Dakota, the 220th dividend, 25 cents per share, $31,500; payable Nov. 25th. The total to date is $6,056,250 and for 1896, $344,000.

Cariboo, B. C., Mining, Milling and Smelting Company, 2 cents a share, $16,000; payable Dec. 7th. This is the thirteenth dividend declared by the company since February, 1895, a total, including the present dividend, of $125,401.34.

Calumet and Hecla Copper Mining Company of Michigan, $5 per share, $500,000; payable on the 17th of December. This is the fourth dividend of like amount in the present fiscal year, the five amounting to $2,500,000. With this dividend the company will have disbursed $40,850,000 in cash dividends to stockholders, the largest dividend account of any mine in America.

Recent California Mining Incorporations.

Quartz Glen Mining Company, Calaveras; capital stock, $250,000; G. and F. A. West, W. T. Harris, J. W. Ferris, A. W. Bell.

Estorff Mining Company, San Francisco; capital stock, $75,000; $699.30 subscribed; E. E. Sutro, A. W. Myer, W. C. Spencer, J. C. Brickell, W. G. Straugh.

Bunker Hill Hydraulic Mining Company, San Francisco; capital stock $1,000,000, all subscribed; A. J. Hughes, J. J. Jones, J. A. Stephens, S. E Thurston, W. H. Lee.

American Mining and Exploration Company, San Francisco; capital stock, $250,000; $250 subscribed; W. Kolman, W. H. Harrison, F. McCue, E. W. McKinley, C. A. Webster.

Oleta Gold Mining and Power Company, San Francisco; capital stock, $2,000,000; $2500 subscribed; W. E. Holbrook, H. Routledge, I. N. Chapman, J. B. Goldstone, A. Bannister.

Mineral King Mining and Milling Company, San Francisco; capital stock, $500,000—$412,500 subscribed; E. J. Hegarty, F. X. Simon, T. P. Rourke, San Francisco; J. Sheeby, San Rafael; J. H. Rourke, Alameda.

THE CALIFORNIA DEBRIS COMMISSION having received applications to mine by the hydraulic process from Edgar Maylone, in the Bald Mountain mine, near Fair Play, El Dorado county, to deposit tailings in Spanish creek; from Nickelson & Williams, in the Crawford diggings, near Camptonville, Yuba county, to deposit tailings in Bridger creek; from McDonald & Hoffman, in the Gilbert mine, near Yankee Jim's, Placer county, to deposit tailings in Devil's canyon; and from the Oregon Gold Mining Company, in the Forty-nine mine, near Enterprise, Butte county, to deposit tailings in a ravine, gives notice that a meeting will be held at room 69, Flood building, San Francisco, Cal., on December 7th, 1896, at 1:30 P. M.

Only 4 1-2 Days to New York---4 1-2.

The Union Pacific is the only line running Pullman double Drawing-Room sleepers and Dining Cars San Francisco to Chicago daily without change. Only one change to New York; dining car service entire distance. Vestibuled composite buffet smoking and library cars between Ogden and Chicago.

The only line running upholstered Pullman Tourist sleepers San Francisco to Chicago daily without change, and personally conducted excursions to St. Paul and Chicago without change, leaving San Francisco every Friday.

Tickets and sleeping-car reservations at No. 1 Montgomery St. Steamship tickets on sale to and from all points in Europe. D. W. HITCHCOCK, General Agent, San Francisco.

Assessment Notices.

OCCIDENTAL CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Silver Star mining district, Storey county, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 24th day of November, 1896, an assessment (No. 25) of fifteen (15) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 29th day of December, 1896, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 18th day of January, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office—Room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

DELINQUENT SALE NOTICE.

GREENWOOD GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Greenwood, El Dorado county, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No 1) levied on the Sixteenth (16th) day of October, 1896, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
Adams, Grove	7	11,000	220 00

And in accordance with law, and an order from the Board of Directors, made on the 16th day of October, 1896, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, Room 79, Nevada Block, 309 Montgomery St., San Francisco, California, on MONDAY, the 14th day of December, 1896, at the hour of 1 o'clock P. M. of said day, to pay said Delinquent Assessment thereon, together with costs of advertising and expenses of sale.

CHAS. E. ELLIOTT, Secretary.

Office—Room 79, Nevada Block, 309 Montgomery St., San Francisco, California.

Every Inventor Wants a Good Patent

Or none at all. To secure the best patents Inventors have only to address DEWEY & Co., Pioneer Patent Agents, No. 220 Market St., San Francisco.

There are many good reasons why Pacific Coast Inventors should patronize this Home Agency.

It is the ablest, largest, best, most convenient, economical and speedy for all Pacific Coast patrons.

It is the oldest on this side of the American continent, most experienced, and in every way reliable.

Conducted from 1863 by its present owners (A. T. Dewey, W. B. Ewer and Geo. H. Strong), this agency has the best knowledge of patents already issued and of the state of the arts in all lines of inventions most common on this coast.

Patents secured in the United States, Canada, Mexico, all British colonies and provinces, England and other civilized countries throughout the globe.

Caveats filed, assignments duly prepared, examinations made, and a general Patent Agency business conducted.

Established and successfully and popularly conducted for nearly thirty years, our patrons number many thousands, to whom we refer with confidence, as men of influence and reliability. Old and new inventors are cordially offered the complimentary use of our library and free advice, etc. No other agency can afford Pacific States inventors half the advantages possessed by this old, well-tried and experienced firm.

WILL NEGOTIATE with owners or their duly authorized agents only.

WILL INVESTIGATE only thoroughly bona-fide properties, either Mines, Prospects or Mineral Lands, whose owners are willing to make reasonable terms. When sending reports on properties also send terms on which you are willing to sell or lease.

READ WHAT MINERS THINK OF THE BRYAN PATENT ROLLER QUARTZ MILL AND JOHNSTON CONCENTRATOR.

OFFICE OF THE CANDELARIA CONSOLIDATED MEXICAN MINING CO.
SAN DIMAS, DURANGO, MEXICO, October 25, 1888.

RISDON IRON WORKS, San Francisco—Gentlemen: Our company has been operating three of the 4-foot Bryan Roller Quartz Mills, one of which has been running steadily for three years, one for two and one for one year. Our quartz is very hard; we crush through a No. 60 mesh screen. Our mills run 55 revolutions per minute, and each crush through 60-mesh screens 12 tons in 24 hours; through 50-mesh, 15 tons; and through 40 mesh, 18 tons. This proportion has been continuous.

One set of dies will crush from 1500 to 1600 tons.
One set of tires will crush 1500 tons.
One ring plate will crush from 2200 to 2300 tons.

The mills require very little attention. At our mill an ordinary "peon," earning one dollar per day, has complete charge.

In regard to sliming, in comparison with stamps, by reason of the discharge surface and the continuous agitation by the scrapers, a MUCH less amount of slime is created. A three years' experience teaches me that, in every respect, the mills are a complete success, and of material benefit to the mining world. They can be set up and running in forty-eight hours and can be dismounted in the same time and removed to wherever desired. Ours were packed on our mule trail over as difficult a road as any in Mexico. As a gold ama gamator it is unequaled by any mill now in existence. Yours truly,

D. M. BURNS, Superintendent.

BULLION-BECK AND CHAMPION MINING COMPANY.
EUREKA, UTAH, August 24, 1895.

THE RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: Referring to contract made by you with the Bullion-Beck and Champion Mining Company, by which you were to furnish one 5-foot Bryan Roller Quartz Mill on four months' trial, in competition with the Huntington Mill, would say that we have made the test, and the Bryan Mill has proven so greatly superior on all points claimed, viz., capacity and economy, that we have ordered a second Bryan Mill from you and have concluded to discontinue the use of the Huntington Mill.

Yours truly, JOHN BECK, Pres.
SIMON BAMBERGER, Director. [Copy.] W. J. BEATIE, Sec't'y.

BULLION-BECK AND CHAMPION MINING COMPANY.
EUREKA, UTAH, Aug. 24, 1895.

THE RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: In February last, in connection with the five-foot Bryan Roller Mill which we took from you to test in competition with the Huntington Mill, we also took a six-foot Johnston Concentrator to be tested with ten Frues, one end shake with four belts and one side shake Woodbury. We have been working these machines since the mill was completed, at such times when we had sufficient water.

The terms on which the test was made was that the machine doing the most satisfactory work should be accepted and the others taken out. This did not apply to the Frue, as they were purchased with the plant. In compliance with this agreement, we now inform you that the Johnston Concentrator has proved so superior over the other machines that we now order from you four more of the Johnston Concentrators. Yours truly, JOHN BECK, Pres.

SIMON BAMBERGER, Director. W. J. BEATIE, Sec't'y.

GREAT SALT LAKE AND HOT SPRINGS RAILWAY.
S. BAMBERGER, President and Manager.
SALT LAKE CITY, UTAH, October 10, 1895.

B. R. TAWNDRAW, ESQ., care Guyer Hot Springs, Ketchum, Idaho—Dear Sir: In reply to yours of the twenty-eighth of September, we have been using at the Bullion-Beck Concentrating Works, Frue Vanner, Woodbury and Johnston machines, side by side for the last four months; and after a thorough trial of all of them, we concluded that the Johnston Vanner was doing the most accurate work and was the best; hence, we bought four more Johnston machines and shall continue to use them in preference to any other.

You will find it the easiest regulated machine and very much easier set up than either of the other machines. We bought our machines from the Risdon Iron Works, of San Francisco, where Mr. Johnston, the patentee, personally superintends the manufacturing of them.

Hoping you will make a success, I remain, Yours truly,
[Copy.] [Signed] SIMON BAMBERGER.

THE GOLD VALLEY MINING COMPANY OF SAN FRANCISCO.
C. C. McIVER, President; D. CUSHMAN, Secretary.
MISSION SAN JOSE, CAL., Oct. 17th, 1895.

RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: We take great pleasure in having to inform you that, after a careful investigation extending over a six weeks' steady run alongside of six other concentrators, the Johnston which you put in for us was the only machine from which you could not find a loss in the tailings. It has done all you claim for it and has proved more than satisfactory. We intend replacing all our other concentrators with Johnston's, as we are convinced they will pay for themselves many times over in a year. CHAS. C. McIVER, President.

Two Debris Dams.

It is not generally known that even before the passage of "the Caminetti Law" hydraulic miners in this State built dams to impound debris. Some of these dams were built nearly twenty-five years ago, and higher, the earth forming a solid, compact mass, the water oozing into the spillways or passing over the top, as seen in the pictures.

DEBRIS DAM ON ROCK CREEK, SIERRA COUNTY.

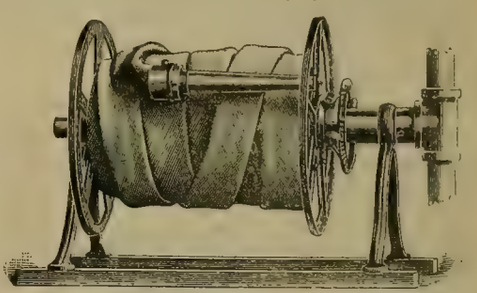
and serve the purpose for which they were intended. Two of these old debris dams are illustrated on this page, the upper cut being of a dam on Rock Creek, Sierra Co.; the lower, one on Slate Creek, in the same county of this State. These engravings are made from photographs taken by the chief officer of the United States Debris Commission, and give a good idea of those structures. The dams of which the two illustrations are a type were and are not built at once. As the canyon or gulch site of the dam filled with debris, the dam was built up higher and higher, the earth forming a solid, compact mass, the water oozing into the spillways or passing over the top, as seen in the pictures.

DAM FOR RESTRAINING MINING DEBRIS, SLATE CREEK, SIERRA COUNTY.

THE time has come when the United States should make better provision for the Government of Alaska. At present it is a judicial district without even the dignity of a territory and governed by the laws of Oregon that were in force prior to 1884. The discovery of rich mineral deposits in many parts of the country has attracted a large number of people there during the past two years. Many of them have become impressed with the value of the mines and some of these are remaining over the winter. Others will return in the spring. As the country becomes better known the possibilities of its future seem promising. However, it has not been the policy of our Government to assist the miner in his work of pioneering. A very small expenditure on its part would do much toward assisting in the development of sources of great wealth.

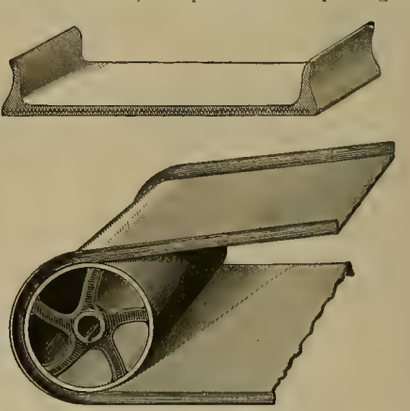
New Automatic Hose Reel.

In the reel illustrated the act of unreeling the hose opens the valve, thus instantly yielding a full supply of water for the point of danger. Though a part of, and in combination with, the reel, the valve can be operated independently, thereby doing away with the necessity of a gate valve on each outlet where a reel is used. This combination is unique, economical and perfect in action. The reel is made for 1½ and 2½-inch fire hose, carrying from 50 to 100 feet in length, as required. It is manufactured by the Gutta Percha and Rubber Manufacturing Company of New York, the Pacific coast branch being at 32 Fremont street, San Francisco.



NEW HOSE REEL.

The "Spadone" concentrator belt illustrated is also made by this company. Its valuable feature is the improvement on the edges, standing at right angles with the belt, except when it is passing over the rolls. At this point it curves over and outward, and after leaving the roll regains its shape easily and naturally. The rubber used in this edge is of high grade and specially elastic, to guard against the liability of breaking as it passes over the rolls, and to withstand long usage. Although not long on the market, a large number of these belts are in satisfactory use.



THE "SPADONE" CONCENTRATOR BELT.

A GOOD indication that confidence in placer mining is not lost is the fact that last week eight locations of gravel were recorded in Auburn, Cal. The same number of quartz mines were also recorded.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Debris Dam on Rock Creek, Sierra County; Dam for Restraining Mining Debris, Slate Creek, Sierra County; New Hose Reel; The "Spadone" Concentrator Belt, 457. Water Ram in Pipes, 462.

EDITORIAL.—Two Debris Dams; Better Government for Alaska; New Automatic Hose Reel; Gravel and Quartz Mines Recorded, 457. Roads and Mining; The Proposed Removal of the Mining Bureau to Golden Gate Park; Sixteenth Annual Report of the U. S. Geological Survey; The College of Mines, 458.

SCIENTIFIC PROGRESS.—Waste Made Valuable; Uncle Sam's Guns, 462.

MECHANICAL PROGRESS.—Water Ram in Pipes, 462.

ELECTRICAL PROGRESS.—An Electric Hæmostat; To Supply New Zealand Gold Fields with Electric Power; Expansion of the Telephone Service in Japan; An Electric Railway for Mount Blanc; X-Rays Among Fireflies, 462.

PRACTICAL INFORMATION.—The Amount of Water in the Earth's Crust; New Small Coins; Amount of Moisture in Green Wood; A Charter for a Railroad from Lake Nicaragua to the Caribbean Sea; Copper and Bronze Coins, 463.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 466-7.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 474.

MISCELLANEOUS.—Concentrates, 459. Laboratory Tests in Connection with the Extraction of Gold from Ores by the Cyanide Process; Africa's Small Yield; Notes on a Breathing Gas Well, 460. The Greatest Gold Belt; The Smuggler-Union Mines, Telluride, Colorado; "Gold Mining in British Guiana;" Manganese Ore from Leadville, Col., 461. Coast Industrial Notes; Personal; Obituary; Recently Declared Mining Dividends; Recent California Mining Incorporations; Commercial Paragraphs, 465.

Roads and Mining.

There is a feeling of opposition to the building of railroads up into the mining districts along the Sierras among certain classes of people, which resembles very much the old antipathy that many years ago prevailed among workingmen against labor-saving devices. Nowadays the laboring people are as quick as any to recognize the advantages that will accrue to them from the introduction of labor-saving machinery.

A mining man from Calaveras is reported, in the Stockton *Mail*, to have said on this subject:

There is a feeling up in the mining region that a railroad will hurt the community instead of benefiting it, and it is not confined to any small number of people either. The teamsters would be knocked out by a railroad; and there is a good deal of teaming up in that region. The stage lines would be hurt, and I suppose that in Calaveras county about a hundred horses are worked daily in the stage business. Considerable lumber is cut in the mining region, and that industry would go under because the mills could not compete with the lumber sent up from this city. Then there are small farmers, who raise hay for the home market and get from $15 to $20 a ton when it is selling here for $6. They would be affected. Of course the same conditions would apply to the vegetable-raising business, for you can buy as much garden truck here in Stockton for 15 cents as you can there for 50 cents. There are few vegetables raised, so that doesn't cut any figure. Generally speaking, all classes of producers who depend upon the soil for their support would be affected, because they would be brought into competition with the valley, whereas at present they are to a large extent independent of your valley prices owing to the cost of sending produce up into the mines by team.

Probably very few of the people referred to would not be benefited in the end by the changed conditions and greater prosperity of the mines. It must be remembered that but for the activity in the mining industry they would not make even a living. Up in Siskiyou county, where a wagon road was being built over Salmon mountain to Sawyer's Bar, an old fellow who had a cabin on the trail at the foot of the divide, and had for years made a living by helping the packers load and unload their mules at their camping place, insisted that the country was going to the dogs because pack trains would no longer come his way.

Railroads and good wagon roads will in time do as much as anything else to reduce the cost of working mines and of milling the ores. Owing to the reductions that have taken place ten mines are now worked where one could be years ago. Even a slight further reduction in this cost will mean that many thousands of tons that cannot now be worked would yield a profit. Every cent of reduction in the cost per ton will mean the addition of great wealth to the State.

The College of Mines.

The Los Angeles *Times* in an editorial advocates the establishment of two schools of mines in California—one in the northern and one in the southern part of the State—and says that we have at present no school of mines in the United States. The *Southwest Miner*, published at San Bernardino, takes exception to the statement that there is no mining school in America, and while admitting that California has no mining school, speaks of the South Dakota and Colorado schools of mines as the only ones in the country. No mention is made of the Columbia school of mines at New York, one of the best equipped departments in the second richest university in America.

It seems rather strange that an institution like the University of California, which is recognized in the East as one of the great institutions of learning in this country, is so little known in this State. There is a school of mines at the University of California, and has been for many years. It is well equipped with libraries, mineral collections, mills and reduction works for illustrating metallurgical methods, and shops. In fact, the buildings and equipments available for the mining student could not be duplicated for $1,000,000. The salaries paid to the professors in the different departments in which the mining student pursues his studies amounted to $68,090 in 1895. These salaries included for the Professor of Metallurgy and his assistant, $6540; for the Department of Geology and Mineralogy, $7600; Chemistry, $9120; Mathematics, $13,200; Civil Engineering, $11,240; Mechanical Engineering, $9890; Physics, $10,500. This does not include any of the salaries paid to the president and the administrative officers; nor to professors in other departments in which the student in the college of mines may take lectures in order to round out his education. The annual salaries of the whole University paid for teachers amount to over $300,000. In point of wealth it ranks fourth in the United States. The president of Harvard University, not long ago, spoke of it as one of the five great universities of America.

Now, as to the professors, the University Register gives the following as the heads of different departments in the School of Mines: Stringham, mathematics; Christy, mining and metallurgy; Hesse, mechanical engineering; LeConte, geology; Rising, chemistry; Slate, physics; Soule, civil engineering; Lawson, field geology and mineralogy; Ardley, free-hand drawing; Kower, mechanical drawing. Most of these men are well known in the scientific world outside of California and outside of the United States.

To be sure, many of these men lecture to other students than those of the College of Mines; but were all the scientific colleges built up separately, with separate faculties, each one would make a very poor showing with the money that has been spent. For the State to establish another School of Mines, with as able a faculty and capable of doing as good work as that which Berkeley is now doing, would cost at least $2,000,000. And the Los Angeles *Times* suggests the establishment of two mining schools, one north and one south of Tehachapi, each at a cost of $50,000. The interest on that sum would not pay the salary of one of the members of the faculty of the California School of Mines.

The School of Mines can be improved. It is somewhat cramped for room for lectures and for its large and valuable collections of minerals, which is hardly second to any in America.

Regent Reinstein has obtained promises of gifts of money that will amount to over $4,000,000, to be applied to the erection of buildings and increasing the endowment funds of the University. Within the next ten years no doubt other large sums will be obtained, and Mr. Reinstein and those associated with him, in their plans for the enlargement of the University, expect to make the present mining school the best in the world. This will involve the expenditure of from $1,000,000 to $2,000,000.

It can safely be said that at present the University of California has a good mining school. Among its graduates are some of the leading mining engineers of the world. Of these Gardner Williams is in charge of the great Kimberley diamond mines; H. H. Webb is chief engineer of the Consolidated Gold Fields in South Africa, who own principalities and control millions; Charles Butters and others have taken high rank in the mining world.

The Proposed Removal of the Mining Bureau to Golden Gate Park.

It has been proposed in two of the San Francisco dailies that the State Mining Bureau be moved out to Golden Gate Park. One of them says: "The advantages of such a change are so obvious that we cannot foresee any serious objections to the plan. Where one person now inspects the exhibit of California's mining resources, fifty would see it in the Park."

Why not, then, propose to move the State University out to the Park? Where it is now located not more than one visitor in ten thousand ever sees it.

The main purpose of the Mining Bureau seems to have been lost sight of by these papers. It was not established as an advertising medium. The State Mining Bureau act of March 23, 1893, provides as follows:

It shall be the duty of said State Mineralogist to make, facilitate, and encourage special studies of the mineral resources and mineral industries of the State. It shall be his duty to collect statistics concerning the occurrence of the economically important minerals and the methods pursued in making their valuable constituents available for commercial use; to make a collection of typical geological and mineralogical specimens, especially those of economic or commercial importance, such collection constituting the Museum of the State Mining Bureau, to provide a library of books, reports, and drawings bearing upon the mineral industry, the sciences of mineralogy and geology, and the arts of mining and metallurgy, such library constituting the Library of the State Mining Bureau; to make a collection of models, drawings, and descriptions of the mechanical appliances used in mining and metallurgical processes; to preserve and so maintain such collections and library as to make them available for reference and examination and open to public inspection at reasonable hours; to maintain, in effect, a bureau of information concerning the mineral industries of this State, to consist of such collections and library, and to arrange, classify, catalogue, and index the data therein contained, in a manner to make the information available to those desiring it, and to provide a custodian specially qualified to promote this purpose; to make a biennial report to the Board of Trustees of the Mining Bureau, setting forth the important results of his work, and to issue from time to time such bulletins as he may deem advisable concerning the statistics and technology of the mineral industries of this State.

The bureau is an educational institution and is doing good work in that direction. Its published papers give the results of its most valuable work. These are forwarded free, upon application, to any who may require them. Those who have business with the bureau are people interested in the questions that may be answered there, and who go there for information. As to this, Mr. Henry S. Durden, the curator of the museum, says:

To move the museum to the Park would very largely detract from its value to our mining and business men. A large proportion of our visitors are in search of information. They come to study various ores and formations, and the modes of occurrence in nature, of the mineral they are in quest of. They also want to actually *see* the mineral, that they may be able to judge of its suitability for their purpose, resemblance to other samples with which they are already acquainted, etc.

Busy men cannot always afford the time that it would require to go to the Park for such investigations, and, as the first and main object of the institution is practical utility, it is certain that its usefulness would be much diminished by moving it so far away.

It might be visited by a larger number of mere sightseers if removed to the Park; but, as it was never intended to be a mere show, where the idle could while away an hour or two, but was created for purposes of practical utility, that would be no argument in favor of moving it.

If moved at all, it should be to a position more central to the mining and manufacturing interests, i. e., nearer to Pine and Montgomery streets.

THE sixteenth annual report of the United States Geological Survey has just been published. Director Walcott explains some changes in the policy of the survey that will be of interest to miners. One of most practical importance has been to bring the survey more in touch with some of the economical and educational interests of the country.

Concentrates.

THIS is the nineteen hundredth issue of this paper.

THE Red Mountain road will be in Rossland, B. C., this week.

ORE is hauled at Butte, Montana, on cars of the street railway company.

THE Sacramento mine of Mercur district, Utah, has posted its first dividend.

TWELVE mineral locations were made in San Bernardino county last week.

THE Anaconda Company, in Montana, has at its brick yards nearly 60,000,000 bricks.

THE Central Hill hydraulic mine in Calaveras county, Cal., produced $14,500 for the season's run.

HAMILTON SMITH'S Idaho visit is partly to make a report on the Helena & Frisco mine, Gem, Idaho.

THE Johannesburg decision in the cyanide patent cases applies only to the South African Republic.

THE United States Geological Survey is making a topographical survey of the Tintic district in Utah.

A NEW ruby bearing tract has been discovered in Upper Burmah which is said to be rich in that mineral.

THE first steps were taken at a meeting of brokers at Spokane, Wash., last week to form a mining exchange.

ANOTHER organization to deal in coast mining property is being started in this city to begin business early in '97.

JOHN TAYLOR & Co., 63 First street, San Francisco, supply manganese, ground and sacked, for the chlorination process.

WITH the opening up of mines, especially gold mines, all over Nevada, the outlook for prosperity in that State is good.

A PETITION to the Northern Pacific asks for the building of a branch road to the Gebo coal fields in Carbon county, Mont.

DURING October, '96, the Alaska Treadwell G. M. Co.'s ore averaged $2.84 per ton value; the expenses were $1.10 per ton.

THE Yellow Metal Mining Co., 927 Market street, S. F., are going to put a 20-stamp mill on their property at Angels, Cal.

THE Mercur Company will fight the assessment of $10,000 levied on its output for the past year under the State laws of Utah.

DURING the first ten months of '96 silver shipments from San Francisco aggregated $10,174,228 in value; gold shipments $11,469,370.

AN organized effort is being made in Colorado to bring influence to bear in Congress to establish a Department of Mines at Washington.

FOR the first ten months of 1896 the United States produced 157,910 tons of copper, an increase of 29,718 tons over that of the same months last year.

THE page compilation in last week's issue is believed to contain everything of value up to date regarding recent reference to the cyanide process.

EMPLOYMENT is being given many men on assessment work in different parts of the State, for the time within which it must be done is becoming short.

THE prospecting season is over in British Columbia, but on many locations the owners succeeded in making preparations in time to do development work all winter.

THE Palmer Mountain Gold Mining Company at Loomis, Idaho, proposes to run a double-track tunnel 3600 feet into Palmer mountain to tap and work the mines.

MANY of the statements weekly appearing on this page are answers to questions received by mail, the information asked being deemed sufficiently important to publish.

THE gold production of the United States for 1895, as received by the mint bureau, was $53,026,355. This was an increase of 35 per cent over the production of 1894.

THE capacity of La Colorado mill at Minas Prietas is to be doubled and cyanide plants of 100 tons capacity each are to be erected at La Colorado and Minas Prietas mills.

THE Black Oak mine in Tuolumne county, near Soulsbyville, is reported to have been sold to Leopold Meyers of Brussels and Charles L. Meyers of New York for $500,000.

THE claim jumper will be in evidence again as usual on the first of January and those who have locations will do well to see that their assessment work is done before that time.

ON the new railroad, 60 miles long, between Leadboro and Townsend, on the Northern Pacific, the first that went over the line was loaded with 300 tons of ore for Helena smelters.

AT Savonnas, B. C., at the lately discovered cinnabar deposits, large bodies of rich ore have been blocked out, and new locations are being made. A company is now erecting a furnace.

A LIST of the prices of the shares of nineteen of the leading mines in British Columbia, giving their price January, 1895, and September, 1896, shows that there has been an increase of nearly 600 per cent.

THE promoters of the proposed Sierra Pacific Railroad from Stockton to the mines of Amador and Calaveras counties have taken active preliminary steps that indicate that they will push the scheme through.

TWO new discoveries of gold, one of quartz and one of gravel have been made in Wales, the latter in the sands of the Mawddach river. Applications for dredging have been granted by the authorities.

SEVENTY-EIGHT liens are reported filed against the Golden Scepter Mining Company at Phillipsburg, Montana, aggregating $100,000. The lien of Fraser & Chalmers of Chicago is the largest, amounting to $51,000.

THE "suspension of assessment" law applied only to the calendar years '93 and '94, and non-performance of assessment work for '95 and '96 leaves such unpatented mining locations subject to relocation January 1st, '97.

THE Cariboo gravel mines are mostly closed for the winter and a number of miners are on their way to California. There will probably be a larger influx of miners from the North for the winter than ever before.

THE Manitoba *Free Press* advocates the construction, with government aid, of a refinery to treat Canadian ores and the building of a railroad into the Kootenay country in order to make it once more a Canadian possession.

SUCH a number of Senators and representatives have expressed themselves so strongly in favor of the establishment of a Department of Mines and Mining that any move made in Congress will be sure of serious consideration.

THE Secretary of the Treasury has issued an order removing the restrictions placed upon the importation and sale in the territory of Alaska, except the islands of St. George and St. Paul, of breech loading rifles and ammunition.

IT is reported that a coal mine has been discovered at Sudbury, Ontario, and Prof. Coleman of the Ontario Bureau of Mines has been sent to report upon it. At present all coal used in Ontario is brought from the United States.

FROM January 1st, '96, to date there have been exported to Europe about $45,000,000 in gold and $34,000,000 in silver. During the same time the gold imports to that port aggregated over $75,000,000 and the silver imports $5,000,000.

THE Sierra Buttes Consolidated Gold Mining Company has been organized by San Francisco and Nevada county people to work the old mine of the same name in Sierra county, from which several millions were taken by the English owners.

MRS. N. COLLINS, Columbia Falls, Montana, is superintendent of the Montana Queen Mining Company, and will this winter give "her personal attention" to the development of the Montezuma and Reindeer. In the spring a smelter is to be erected.

THE silver miners in Colorado, Nevada and Utah are taking a very philosophic view of the result of the election, and in spite of their disappointment there is evidence already of increased activity in all directions. Of course, gold mining comes in for most of this.

IT has been discovered that a law passed in Canada last year will disfranchise most of the voters in the Kootenay country, for it provides that only British subjects may vote at municipal elections. This would leave not many more than twenty voters in Rossland.

NOT to be behind the rest of the world, "eight prominent society ladies" of Spokane, Wash., have organized "The Woman's Northwest Mining and Investment Co.;" capital $2,000,000. It is their announced intention to "actively engage in the mining business."

THE heavy falling off in the output of gold in Australia, and the failure to increase the output in Africa this year, is doing much to cause the lively increased interest British investors are taking in the mines of California, Colorado and other parts of the West and British Columbia.

THERE have been many representatives of capital in Cripple Creek and other parts of Colorado of late, and it is claimed that in that camp more big enterprises have been founded during the past month than for six months previous. In the meantime the output of gold continues to increase.

THE De Lamar mine of Idaho report for October is as follows: Crushed during the month, 4153 tons; bullion produced in mill, $58,065; estimated value of ore shipped to smelters, $4000; miscellaneous revenue, $315; total produce, $62,380; total expenses, $44,890; profit for the month, $17,490.

THE Blaine tunnel of the Trade Dollar group and the Idaho tunnel of the Black Jack group of mines in Idaho have been connected, making an opening through Florida mountain. The Blaine tunnelis 4317 feet in length and the Idaho tunnel 3200 feet, making a total of 7517 feet, or nearly one and one-half miles.

THE air compressors within three miles of Rossland have a capacity of 160 drills, an increase from ten a year ago when the Le Roi had a 7 drill compressor and the War Eagle a 3-drill compressor. Orders have been placed for fifty drills more. The Le Roi's new plant will have a capacity of forty drills.

THE California State Mining Bureau does not make assays, leaving that to private assayers, whose business it is. But where a new mineral or one peculiar in any way is forwarded to the bureau a quantitative test will be made. All minerals forwarded will be qualitatively determined, but that is very different from a quantitative test.

THE water pipes crossing the Crescent mine leading to the Silver King, at Park City, Utah, were cut last week by James McGregor, the owner of the former mine, and the Silver King was forced to shut down, some 200 men being thrown out of employment. There has been a suit pending for over a year between the two companies in the premises.

THE placers of the State of Nevada are attracting attention of men with means. In the Gold Creek district, formerly known as Island Mountain, seventy-five miles north of Elko, the Gold Creek Mining Company, which has secured several thousand acres of gravel, has over two hundred men at work constructing a reservoir and making other preparations for work.

THE new mining exchange formed at Rawlins, Wyoming, has good cause for existence. The quartz mines on the Sweetwater and Grand Encampment have promised well. Besides, there are large and very important gravel deposits, both north and south of Rawlins, well worth exploiting, but none of which can be worked without the expenditure of considerable capital for water.

AFTER all Hamilton Smith will not come out here to investigate the Mariposa grant—at least not at present—according to the latest advices. He was in Spokane on Thanksgiving Day, having gone there from Butte to look into the Helena & Frisco, for which he was negotiating for the Exploration Company. It was his intention to go to New York and then to return to London before Christmas.

RECENT reports on the cost of the cyanide process in South Africa show that at the Crown Reef for the twelve months ending March, 1895, it was 2s 11.473d per ton; at the Geldenhuis Deep in July, 1896, 8100 tons cost 2s 7d per ton; at the Geldenhuis Estate the cost in the same month was 2s 6.24d per ton, and in the City and Suburban in August it was 2s 3.608d.

A TELEGRAM from Butte, Montana, announces that the last obstacle to the reorganization of the Butte & Boston Co. has been removed by the sale of the 90,000 shares of stock held by the Davis estate, the sale having been made under an order of the Massachusetts court for $2 a share. It is predicted that the reorganization will now be speedily perfected, and that the vast properties in Butte will be in operation in a few months.

JOHN FERGUSON'S little 2-stamp sampling mill in Sonora claims the record for turning out bullion. According to the *Union-Democrat*, during the palmy days of the Bonanza mine, when $380,000 was taken out in one day, John Ferguson ran through his mill $40,000 in four hours, or at the rate of $10,000 per hour. The bullion was so free from quartz that he had to hang the stamps up twice to remove the precious metal from the battery.

IT is the intention of the Blue Lakes Power Company, as soon as their contract to furnish 1500 H. P. to the California Exploration Company is completed, to furnish power to any miner and mining company along the mother lode in Amador and Calaveras counties as rapidly as possible. The company own the Stockton Water Works and will supply that city with water from their reservoirs instead of that now procured near Stockton.

THERE were 2417 carloads of freight handled at Colfax from January 1 to December 1. This was an increase of 50 per cent over the amount handled last year, and was due to the increased activity in mining. More freight was received at Colfax than at any other station between Sacramento and Ogden. It is a distributing point for Colfax, Forest Hill and Iowa Hill in eastern Placer, and the towns of Grass Valley and Nevada City in Nevada county.

THERE is paid out in the Rand, South Africa, for labor and stores annually about £7,000,000. Of this sum £2,400,000 is paid for white labor at an average of nearly £300, or $1500 per annum. For Kaffir labor £2,000,000 is paid to 60,000 natives, who receive about one-fifth the pay of the white laborers. It is said that the white laborers do not look with favor upon the movement to reduce the wages of the Kaffirs, believing that it will be only a question of time when theirs will be attacked.

THE Cloud City Miners' Union of Leadville last week issued an address to Governor McIntyre and the people of Denver in which it attempts to show that a conspiracy existed among the mine owners for the purpose of keeping the State troops in Leadville until the Union is disorganized. The miners disclaim responsibility for the Coronado and other outrages that have occurred there, and offer to guard the property and aid in maintaining peace, if the troops are withdrawn.

THE Southern Pacific and Santa Fe companies are both reported to have made surveys into the Randsburg mining district, one from Mojave and the other from Kramer. It is said that the Southern Pacific Company contemplate building one into Death Valley. A telephone line built by private capital now runs from Mojave into Gerlach station. It is to be extended into Randsburg, a distance of some twelve miles. A private telegraph line is to be built into the district by Los Angeles capitalists.

WHEN the question of obtaining a supply of water for milling purposes has been settled the Randsburg mines in Kern county will probably turn out considerable gold. Nearly all the locations are owned by men without much capital, but sufficient development work has been done to show large deposits of good paying ore. It would appear from what has been done in the way of sinking wells for water, that a good supply will be obtained before long. At present a 10-stamp mill is being erected by parties who have obtained sufficient water at a depth of 190 feet.

ON the 17th inst. the Calumet & Hecla of Michigan will pay a $500,000 dividend, the fifth of like amount for the calendar year, making a total aggregate of cash dividends paid by that company $46,850,000. For a long time the Cal. & Con. Va. of Nevada have stood at the head of the list of dividend-paying mines. The Cal. & Con. Va. consolidated in '84. Taking the two together, that property is still far ahead of any other mining property on the continent as a dividend producer. Prior to consolidation Con. Va. paid in cash dividends $42,390,000 and California $31,320,000; since then they have paid $3,948,800, a grand total of $77,658,000.

IN his annual report Secretary Carlisle will propose measures for a partial cancellation of the paper currency. He will suggest that the notes now held by the Treasury, constituting its free cash balance, shall be destroyed. This operation would involve the retirement of about $40,000,000 of Treasury notes and about $53,000,000 of greenbacks, and would reduce the amount of outstanding paper payable in gold to a more conservative scope in relation to the amount of gold held for redemption. The difficulty with this suggestion at present is the lack of revenue. As matters now stand, the Treasury meets deficits with its surplus cash. Take away that cash and borrowing will be necessary to meet current expenditures.

THE General Land Office has decided, in favor of A. A. Goldstein, his claim under a mineral location to a large part of the townsite of Juneau, Alaska. In 1886, after several others had filed and abandoned, A. A. Goldstein, a merchant, located on a mineral claim which included nearly the whole of the present site of Juneau. More than the necessary amount of assessment work was done to secure the patent, and, when two years later a regular application was made, the citizens began a concerted movement to kill it. At a mass meeting in 1888 Goldstein, who was by force compelled to be present, was asked to give up his claim on threat of lynching. This he refused, but he agreed, in the event of securing a patent, to deed, free of charge, to actual occupants all property improved or held by them.

AN example of a big mine working large amounts of ore at a very small profit is given in the Geldenhuis Deep, South Africa. In twenty-seven days' run the manager reports as follows: "Crushing from mine, 15,227 tons; and from development dump, 493 tons; yield, 3542 ounces; cyanide treated, 9500 tons, yielding 1975 ounces." On this the net profits were $2000. The report from the Robinson tells a different story. The manager cables on the work for October as follows: "Mill: 120 stamps at work; 16,500 tons of ore crushed; yielded in smelted gold, 12,017 ounces; from concentrates (by chlorination), 935 ounces; from tailings (cyanide process), 2695 ounces; from slimes, 1023 ounces; from own ore, 16,670 ounces; from concentrates bought (by chlorination), 3348 ounces. Total gold recovered, 20,018 ounces." On this the profits were $200,000.

NO 20-cent silver pieces have been coined at any of the United States mints since by an act passed in May, 1878, such coinage was prohibited. The coinage of this piece went on for five years only, and the weight of the coin was 77 grains. There are now of them outstanding about $160,000. Since February, 1887, no trade dollars of silver have been coined, and the total amount of these in existence, though not in circulation, is now $35,000,000. An old coin of silver very rare nowadays is the silver half-dime of 20 grains, the coinage of which was originally authorized by act of Congress in April, 1792, more than a century ago. The coinage of half-dimes was continued until 1873. The coinage of gold dollars was discontinued in 1890. Prior to that time nearly 20,000,000 gold dollars had been coined, and many of them are still in active circulation. The first of them were coined under a law passed in 1849. The three-dollar gold pieces, coined between 1853 and 1890, were 77 grains in weight, and there are of them outstanding $1,500,000 worth.

Laboratory Tests in Connection with the Extraction of Gold from Ores by the Cyanide Process.*

NUMBER V—*Concluded.*

By H. VAN F. FURMAN, Denver, Col.

A number of other methods for the determination of the available cyanide have been proposed, but that first described is believed to be the best.

In a well-regulated mill the strength of the solutions is tested on each tank every four hours while the solutions are percolating.

The method usually adopted for the determination of the free potassium cyanide in mill solutions is as follows: 10 c.c. of solution are diluted with distilled water to 65 or 70 c.c. and titrated with the standard silver nitrate solution, without the use of an indicator. When all the free potassium cyanide is changed to $KAg(CN)_2$ an additional drop of the silver solution produces a distinct white opalescence, owing to the formation of insoluble zinc cyanide, thus:

$$K_2Zn(CN)_4+AgNO_3=KAg(CN)_2+Zn(CN)_2+KNO_3.$$

It is probable that this second reaction commences before all the potassium cyanide is combined with silver; for on partly titrating a solution containing both salts, and allowing it to stand, a white precipitate slowly forms. Hence the titration must be performed rapidly, in which case the separation of the white precipitate can be taken as marking the end point. The titration requires some practice to be performed properly.

7. DETERMINATION OF THE FREE HYDROCYANIC ACID IN SOLUTION.

To 10 c.c. of the mill solution add 10 c.c. of a solution of potassium bicarbonate (containing 15 grammes of $KHCO_3$ to the liter), dilute to 65 or 70 c.c. and titrate as in Test 6, without the use of potassium iodide as an indicator. Upon the addition of the bicarbonate the following reaction takes place:

$$HCN+KHCO_3=KCN+CO_2+H_2O.$$

The titration gives the HCN in terms of KCN, and $KCN\times 0.415=HCN$. As this titration gives the potassium cyanide and the hydrocyanic acid, the difference between this result and that obtained in Test 6, multiplied by 0.415, gives the hydrocyanic acid.

For each c.c. of mill solution taken 1 c.c. of the potassium bicarbonate solution is used. This will be sufficient for solutions containing as much as 0.4 per cent of HCN, which is much higher than mill solutions usually run, but the excess does no harm.

The addition of the bicarbonate solution usually causes a distinct turbidity, which should disappear when the solution is diluted, giving a clear liquid for titration. If, as rarely happens, a faint turbidity remains, a duplicate of the solution to be titrated is prepared, the end point being shown by the increased cloudiness in the titrated solution as compared with the blank solution.

8. DETERMINATION OF THE TOTAL SIMPLE CYANIDES IN SOLUTION.

To 10 c.c. of the mill solution add 10 c.c. of half-normal sodium hydrate solution (20 grammes of NaOH per liter), dilute to 65 or 70 c.c.; add a few drops of the potassium iodide solution, and titrate to pale yellow opalescence, as in Test 6. The result is the total KCN, HCN and $K_2Zn(CN)_4$, in terms of KCN. The amount of sodium hydrate to be added depends principally on the percentage of $K_2Zn(CN)_4$ present, as a large excess should be avoided. The amount given will be sufficient for solutions containing 0.7 per cent zinc and 0.4 per cent hydrocyanic acid, and will answer in all ordinary cases likely to be encountered in mill practice. The addition of the sodium hydrate produces a permanent precipitate, but the use of potassium iodide as an indicator prevents any doubt as to the end reaction.

9. DETERMINATION OF THE FERRO, THE FERRI AND THE SULPHOCYANIDES IN SOLUTION.

The ferrocyanides and the sulphocyanides, if desired, may be determined by titration with a standard solution of potassium permanganate in an acid solution, the reactions being as follows:

$$10K_4FeCy_6+K_2Mn_2O_8+8H_2SO_4=10K_3FeCy_6+6K_2SO_4+2MnSO_4+8H_2O.$$

$$10KCyS+6K_2Mn_2O_8+13H_2SO_4=11K_2SO_4+12MnSO_4+10HCy+8H_2O.$$

One portion, acidified with sulphuric acid, is titrated, the result representing both the above compound cyanides. To a second portion, acidified with sulphuric acid, a solution of ferric chloride is added. The resulting prussian blue is filtered off and the filtrate is titrated with the standard permanganate solution. This second titration gives the potassium sulphocyanide.

The permanganate solution should be quite dilute, containing not more than from 0.3 to 0.5 grammes of potassium permanganate to the liter. It may be standardized by any of the approved methods, and its value may be calculated for the compound cyanides according to the above equations.

*Transactions Am. Inst. M. E., September. 1896.

Ferricyanide, if present, may be determined by reducing it to ferrocyanide, and then by titration with standard potassium permanganate as above.

Should sulphides be present, the shaking up of the solution with moist lead carbonate will produce a black precipitate of lead sulphide. When present they must be thus removed, by agitation with lead carbonate and filtering off the resulting lead sulphide, before the compound cyanides can be determined.

10. DETERMINATION OF THE ZINC AND LIME IN SOLUTION.

As these are sometimes of considerable importance, they have to be occasionally determined in the mill solutions. The solution is treated in the manner described in Test 4, and the lime and zinc can then be determined by conventional methods.

11. DETERMINATION OF THE GOLD AND SILVER IN SOLUTION.

Numerous methods have been proposed, but the following which is the simplest is the method generally adopted:

Evaporate one assay ton (=29.2 c.c.) of the solution to dryness in a lead tray. Roll up the lead and cupel on a hot cupel, weighing the resulting button. Alloy the bead with silver, if necessary, and part for gold as usual.

Should the solution contain over 0.2 ounce of gold per ton, the lead should be scorified together with a little borax glass prior to cupellation.

The lead tray is made of pure lead foil, and is 3 inches long, 2 inches wide and ½ inch deep. It should weigh about 20 grammes. For the evaporation, the tray containing the solution is placed on a piece of asbestos cardboard, heated by a burner underneath.

In conclusion, the author wishes to express his indebtedness to Mr. Philip Argall, manager, and Mr. L. G. Eakins, chemist, of the Metallic Extraction Company, and to Mr. William Orr, chemist of the Gold and Silver Extraction Company of America, for valuable notes which have been largely used in the preparation of this paper. Acknowledgement is also due to the courtesy of Messrs. John Wiley and Sons, who have kindly permitted the use of considerable material contained in the fourth edition of the author's "Manual of Practical Assaying."

POSTSCRIPT.

1. Mr. George A. Packard has kindly called my attention to the fact that the formula given in my paper for determining the percentage of extraction applies only when the weight of pulp used and the weight of solution are equal. To make the formula universally applicable, it should be amended to read as follows:

Percentage of extraction=

$$\text{Assay of solution}\times\frac{\text{weight of solution}}{\text{weight of pulp}}\times 100.$$

$$\text{Assay of solution}\times\frac{\text{weight of solution}}{\text{weight of pulp}}+\text{assay of tailings}.$$

2. The equation—

The strong sulphuric acid at a high temperature decomposes the metallic cyanides thus:

$$2AgCN+3H_2SO_4+2H_2O=Ag_2SO_4+2NH_4HSO_4+2CO_2.$$

—should contain in the first member $4H_2O$ instead of $2H_2O$; and to the second member should be added $+4H$. The equation will then read:

$$2AgCN+3H_2SO_4+4H_2O=Ag_2SO_4+2NH_4HSO_4+2CO_2+4H.$$

This accounts for the liberation of hydrogen in the reaction with sulphuric acid.

3. In the equation showing the reactions with nitric and hydrochloric acids, the amount of hydrogen liberated should be 2H instead of H.

Africa's Small Yield.

From present indications the output of gold in the Rand, South Africa, for 1896 will not exceed, if, indeed, it equals, that of 1895. The output for October has been announced as 199,889 ounces. The output for September was 202,561, and for August 213,417. The increase from the beginning of the year up to the end of August had been so steady and large that it was generally anticipated that the year's total would exceed that of 1895, which was 2,277,640 ounces. To make up that amount this year the output for November and December must amount to 405,685 ounces.

There has been an increase in the milling capacity of the Rand, but the average of gold obtained per ton is less. To a large extent this is due, however, to the working of lower grade ore than would formerly pay. Upon this subject John Hays Hammond at the last meeting of the shareholders of the Consolidated Gold Fields, Limited, in London said:

"I have been asked to explain the decrease in the value of the ore per ton within the last few years, compared with the earlier history of the Rand. The facts of the case, briefly stated, are these: In the early history of the district, owing to the very high costs of operations then prevalent, and owing also to the small batteries then used, it was not possible to make any satisfactory profit from working other than the very highest grade ores—in other words, the mines were picked. We have the same rich ore bodies to-day as are shown in our assay plans at the lowest levels of our property. But the economical conditions have greatly improved since those days, and it is our object to work as low grade ore as possible, consistently with maintaining the required profits. You will appreciate the importance of this, because you will see that it not only enables us to work ore at a smaller cost, but adds materially to the life of the mine as well. I have pointed out to you in my last annual report, and frequently referred to the subject when I have had an opportunity of speaking upon the history and future of the Rand, that the ore occurs in broad patches, not in defined shoots, as in other gold-bearing formations, and that, therefore, we must appreciate the importance of having the development work well carried out in advance of the mill requirements; otherwise there is inevitable disappointment. The battery eats up, as miners call it, a tremendous quantity of ore, and it takes time to run your drives and open up ore reserves. We attribute the disappointments of many mining propositions on the Rand to the failure to adequately provide ore reserves as against the contingency of an occurrence of poor zones."

Notes on a Breathing Gas Well.

Written by HAROLD W. FAIRBANKS, Ph. D.

A very remarkable gas well recently came under the writer's observation while engaged in studying the geology of the Santa Lucia range. It is situated on the Eagle ranch, on the eastern side of the range in San Luis Obispo county, California.

The well is interesting on account of two things: (1), the presence of gas in the Golden Gate series, it being encountered while boring for water; and (2), the intermittent flow of gas, the periods of flow alternating with those of drawing in air.

The geology of this portion of the range is quite complicated. In the vicinity of the Eagle ranch there are four different formations; the oldest, the Golden Gate series, consisting of shale, sandstone and jasper, with numerous ancient eruptives, the whole being probably of Upper Jurassic age. The rocks of this series are extensively developed through the Coast Ranges of California, but have never before been found to contain gas, nor have any indications of coal or oil been met with.

The well was bored on the point of a hill rising perhaps 75 feet above a little flat on which the ranch buildings are situated; this flat is underlaid by Lower Cretaceous shales which surround the hill on three sides. The Chico sandstone occurs, overlying the shales in various places; while to the east, some distance away, the Bituminous Slate series (Miocene) is met with filling the Salinas valley. The Miocene is pre-eminently the oil and gas bearing formation of California. The writer does not know of any locality in the State where gas is obtained in quantities sufficient for use from beds of Cretaceous age, although such may be the case.

The well under consideration has a bore of six inches and was put down to a depth of 356 feet. The strata passed through consists of shale and sandstone having a very steep dip. They are exposed on the south side of the hill at a distance of a little more than a 100 feet from the well, and exhibit the intense distortion of and shearing so characteristic of the Golden Gate series. When first bored, the water rose to within 85 feet of the surface. A small amount of gas was encountered at a depth of 90 feet. Comparatively little gas came from the well at first, but during a stormy spell the well was pumped continuously for some time, and as the water grew lower a noticeable amount of gas began to issue. This increased until it was estimated to amount to 20,000 feet per day. This state of things lasted for about six weeks, when the volume began to decrease, finally becoming intermittent. The well has now been opened for four years, the gas continuing to average about 250 per day. During settled weather the intermittent action is fairly regular, the gas issuing for about three hours, when, an equilibrium being reached, the current changes and air is sucked in for the same length of time. If the air is not allowed to enter the gas will not flow; consequently an automatic valve has been placed at the surface of the well, permitting the ingress of the air. The suction is frequently so strong that, if only a small opening is left a roaring sound is produced, which is audible at the ranch house. The gas issues also with a strong pressure. The amount of water in the well does not affect the flow of gas in any manner.

Whatever the cause of the intermittent action it is influenced by the varying pressure of the air, for before a storm, when the barometer is falling, the gas continues to issue for a much longer period, sometimes for twenty-four hours, and when the rise in the barometer takes place there is the same prolongation of the period of inhalation. During high barometric conditions the equilibrium may continue for some time. The well at the present time produces four to five thousand gallons of water per month, being pumped on an average about every two weeks.

The locality is about twelve miles from the sea in a direct line, and has an elevation of 1,300 feet, so that it would seem impossible that tidal action could have anything to do with the phenomenon. During a talk with Mr. Benton, the superintendent of the ranch, who has closely watched the well, he stated that he had noticed no connection between the respiration and any physical conditions save the one referred to. The gas is used in all the ranch buildings, but is of such a character that with the ordinary burner it does not give a good light, consequently an incandescent burner is used.

The question of the source of the gas is rather a puzzling one. It hardly seems possible that it can be derived from the strata penetrated, and if not it must have its source in the surrounding Cretaceous shales, or possibly in the white Miocene shales, which here, as nearly everywhere else, are filled with animal remains. A well was sunk to a depth of 900 feet in the same area of Cretaceous shales about two miles to the west, but without encountering water or gas. If derived from the Miocene shales the gas must circulate through the rock for nearly three-fourths of a mile at least. The water is very pure, containing no alkali or trace of oil such as might be expected if it has passed through Miocene strata.

As to the cause of the intermittent action no reasonable explanation has occurred to the writer, and it is left for physicists to explain. It is certainly not due to any of the connections on the surface, for the facts stated were observed prior to such connections.

The Greatest Gold Belt.

The New York correspondent of the London *Mining Journal* settles this question in an off-hand way and readily gives the palm to the Mother Lode of California. He says in the issue of Nov. 14th: "We are not disposed to readily yield the palm to your South Africa as a gold-producing country. We have a weakness, as you know, for "whipping all creation," and, like your own army, we don't and won't know when we're beaten. Accordingly, we are not taken aback by the tale our United States Geological Survey expert, Dr. Becker, has just brought to us as one of the results of his recent extended study of the Transvaal region. He there met an American who was formerly his assistant in the Survey, and who is now engaged in mining in the Transvaal, where he has made several millions of dollars. This authority says that, to the best of his knowledge and belief, the gold belt, instead of being 30 miles long—the region now in sight—is practically 1200 miles long. The odd 1170 miles are, however, covered by later geologic deposits which have covered the gold formation. But he thinks this circumstance will merely delay instead of proving a bar to ultimate exploitation. Dr. Becker also reports that within fifteen miles of Johannesburg, on what is called the main reef series, there is an amount of gold, practically in sight, estimated to be worth $3,500,000,000; so that if the remainder of the belt be of similar productivity, the great gold question is not much of a question after all.

"But where do we come in, compared with this traveler's tale? Pray give me leave to tell you. We have in California a great gold belt named the Mother Lode, to which I have at various times referred in this correspondence. It is already well known for a length of 110 miles, reaching from the lower end of Mariposa county on the southeast to the upper extremity of El Dorado county on the northwest. A very conservative estimate by one of our leading authorities was published in the papers here some months ago and gave $6,000,000,000 as the amount of gold "practically in sight" along the 110 miles. The same authority says that, to the best of his knowledge and belief, the granitic mass which has usually been regarded as the southern extremity of the Mother Lode is but a local intrusion of moderate width. He thinks the gold belt has been merely displaced, and comes in again somewhat to the west of its normal trend, continuing on through southern California right to the Mexican frontier. He also considers that it extends north of El Dorado county, under the surface lava beds, through the remainder of California, and then on, across Oregon and Washington, to the Canadian frontier. If these views be correct (and there exist very many observed facts to support them), our Mother Lode is a gold belt having a length of, roughly, 1200 miles within our own domain, and extending far into the lands of our northern and southern neighbors. It need not fear comparison with the South African formation.

"This aspect of the case is of practical importance, because a study of the problems involved has recently led to the commencement of operations having for their object the discovery and working of the gold deposits beneath the lava beds in the northern counties of California. The progress of this work should receive the careful attention of all engineers and capitalists interested in gold production. Not only will a continuation of the auriferous quartz veins of the Mother Lode be in all probability found, but it is in the highest degree likely that ancient gravels will be encountered comparable in richness with those that in mid-California yielded the abundant golden harvests of 1849 and the early 50's. The first decided "strike" will inaugurate a period of adventurous enthusiasm, but the difference, as compared with 1849, will be that the individual digger cannot operate, and must be replaced by joint-stock corporations possessing considerable capital."

The Smuggler-Union Mines, Telluride, Colorado.*

By J. A. PORTER, Denver, Col.

(*Condensed.*)

The Smuggler-Union mines are located at the head of the San Miguel river, just south of the watershed between Ouray and Telluride.

The geology of the district near Telluride, and as far south as Mount Wilson, is now receiving the attention of the United States Geological Survey, Mr. Whitman Cross and party having spent several months of the past summer in this field work. In advance of the government report, Mr. Cross has kindly prepared a paper for the Colorado Scientific Society, which enables me to quote a page, which briefly describes the formation in which the Smuggler vein occurs. The Sheridan mine referred to by him adjoins the Smuggler, and is one of the properties worked by the Smuggler Company:

"I have especially described the San Miguel conglomerate, a sedimentary deposit of much interest, lying immediately beneath the volcanic rocks of the region; and while containing little volcanic material among its pebbles, it is clear that the San Miguel formation belongs to the general period which witnessed the beginning of the volcanic outburst in southwestern Colorado. The San Miguel conglomerate forms very conspicuous cliffs on both sides of the San Miguel river above Telluride. Upon it rests a stratified and, as I now believe, waterlaid series of volcanic tuffs and breccias, constituting the lower member of the volcanic complex. This bedded formation, consisting almost entirely of andesitic debris, has a thickness varying from a little more than 1000 feet to somewhat more than 2000 feet. Its lower limit is seen on the trail leading up Marshall creek, at an elevation of 9800 feet, and it extends to the level of the Sheridan mine in Marshall basin at an elevation of nearly 12,000 feet. As the beds have a gentle dip, it appears that the thickness of the formation in this section cannot be less than 2000 feet.

"It is proposed to call this stratified series of andesitic tuffs and breccias the San Juan formation, as it clearly plays an important part in the make-up of a large portion of the San Juan mountains. The texture of the San Juan beds varies from a thin-bedded, fine-grained tuff, containing no large fragments, to a tuff-breccia, consisting of large, subangular blocks imbedded in a finer grained matrix. The proportion of large fragments varies a great deal, but I have not seen the formation to be made up of large fragments exclusively at any point, although where it is indurated in proximity to some of the large diorite stocks, and in near mineralized areas, it has the appearance of a massive breccia. The upper limit of the San Juan formation may not be always clearly definable. In the mountains about Marshall basin it is, however, very sharply defined by the appearance of the first massive lava flow of augite andesite."

The Smuggler vein is remarkable for its continuity and regularity. It crosses the watershed of Canyon creek, a tributary of the Uncompahgre, and Marshall creek, which runs into the San Miguel at Pandora, at an altitude of 13,200 feet, at which point the thickness of the rocks of igneous origin might be roughly estimated at 3500 feet, since Marshall creek exposes the underlying conglomerate in nearly horizontal position at an altitude slightly less than 10,000 feet. The vein is plainly visible upon the surface, where it crosses the divide, and cuts through the rhyolite and augite andesite down into the andesite breccia to within only a few hundred feet above the conglomerate, as it crosses Marshall creek. What the character of the vein may be after passing into the conglomerate and sandstone is not yet determined. It will be many years before any of the mines of Marshall basin reach the horizon of the conglomerate.

Only two cross-faults occur in the entire length exposed by underground workings. The first is at a point near the south end of the property, and is caused by a large quartz vein—the Pandora—containing gold, but little or no silver. It dips 45° to the south. The plane of fault is nearly at right angles to the course of the Smuggler vein, and the movement of this fault, is about fifty feet. The second fault of only a few feet is made by the Revenue vein, which crosses the Smuggler vein at an angle of about 15°, and is as well defined as the latter. This vein is now being developed, and is very easily worked, owing to the decomposed state of the ores it contains. It carries less gold and more lead than the main vein. The deep tunnel follows this vein for some distance, as a matter of economy in reaching the shaft.

The Smuggler vein is probably a fault fissure. Both the hanging and the foot wall show large polished surfaces. Striation is very frequent, and gouge matter, several inches in thickness, occurs in places upon the hanging as well as the foot wall. Yet, although this is largely the case, long distances occur where the quartz, which almost exclusively forms the filling of the vein, shows no parting whatever from the country rock. To use a miner's expression, it is frozen to the walls.

The average thickness of the vein is about five feet, seldom narrowing to less than two feet, and rarely widening to as much as ten. Enclosures of country rock are frequent, sometimes as fragments, and more frequently in continuous masses between bands of the lode. Cavities are rare; and no such structure occurs as is seen in some veins where corresponding minerals are found at each wall, and others succeed in conformable layers towards the center. In the Mendota claim a mass of andesite several hundred feet in length and 30 or 40 feet in thickness divides the vein; or, as usually expressed, the lode forks and comes together again in several hundred feet. This is the only point in the workings where such an occurrence is met with, except on an exceedingly small scale, when a stringer leaves the vein for a few feet only. Associated with quartz, rhodocrosite occurs in places and imparts a pinkish color to certain bands in the vein, which are sometimes nearly a foot in thickness and very regular for many yards. When this mineral is present in sufficient quantity to color the vein, that portion is seldom rich in the precious metals. Very small quantities of calcite, brownspar and heavy spar also occur.

The minerals occurring are pyrite, chalcopyrite, galenite, sphalerite and the arsenical silver minerals. Proustite and polybasite have been determined, and probably nearly all of the arsenical silver minerals occur. No specimens of tetrahedrite have been recognized. Metallic silver is very rarely encountered. Metallic gold is more frequent, although unusual. The remarkable feature of the vein is the regular and continuous distribution of the ore, which generally lies near the footwall. The usual occurrence is a few inches of richer ore (so-called "shipping ore") and a foot or two of banded structure, more available for concentrating, which goes to the mill. So constant is the occurrence that over a mile has been worked along the vein on various levels without meeting any part where the ore is not present in sufficient quantity for continuous stoping. One remarkable feature is the constant increase of gold value toward the south, throughout the entire workings, and the corresponding decrease in silver value in same direction. Where the vein crosses the divide, at the extreme north end of the property, the gold value is hardly one-quarter that of the silver. The transition from silver to gold is almost constant until, a mile south, the vein practically becomes a gold lode. This change does not correspond to depth gained by slope of mountain toward the south end of the property; for on the north side, at a corresponding altitude, the vein contains gold to the extent of only a few per cent of its total value.

An important change has recently been introduced in the construction of the chutes, which has made it possible to use them in spite of the passage of heavy and sharp rock until a height of even 250 feet has been attained, thus saving the great expense of running and timbering drifts at every hundred feet. The levels will in future be 200 feet and more apart. The change in construction is locally a new departure, and consists in simply placing the timbers used in building of chutes (mills) so that the end will be cut into, instead of the sides, which are soon cut out. The old "mills" were built like a log-house; the new are constructed of short mill timbers, and for the first hundred feet are built with ends presented to the falling rock.

*Trans. Am. Inst. M. E., September, 1896.

IN an article on "Gold Mining in British Guiana," a correspondent of the London *Mining World* says: "As a conclusion, then, we are inclined to the belief that with free-milling gold of a high grade of value, such as is reported to prevail in the northwest district of British Guiana, and moderate working expenses, the cautious investor will not be going too far to assume that the elements of success are contained in the British Guiana gold fields, of course with dependence upon able and competent management, and that these gold fields which have been in men's mouths from the days of Sir Walter Raleigh and Queen Elizabeth may some day rival in popularity the world-famed fields of Victoria and South Africa. At any rate, as the result will tend to the success of British Guiana as a colony of the British Crown, it is a consummation that may at least claim our sympathies and interest."

THE Illinois Steel Company has ordered 30,000 tons of manganese ore from mines at Leadville, Col., to be shipped to Chicago and Joliet as fast as the mineral can be mined. The amount of money involved in the deal is from $600,000 to $1,000,000.

Scientific Progress.

Waste Made Valuable.

The value of the efforts made of late years to utilize culm heaps was shown by N. W. Perry in a paper read before the Anthracite Coal Operators' Association, in which he said:

"The problem of preventing the waste of the product of your mines is one that you have labored with for years, and how well you have solved it is shown from the fact that whereas in one district (the Panther Creek basin) from the commencement of mining in 1820 to 1883, it was estimated by Mr. Ashburner that 20 per cent more of the coal mined had gone to the dirt bank than had been marketed, during the two years, 1881 to 1883, the amount of coal going to the dirt bank was but 52 per cent, and at the present time conservative statisticians figure that 20 per cent is a fair figure for the culm bank waste in the anthracite regions.

"The Pennsylvania Coal Waste Commission estimated that from the commencement of mining up to 1892, the coal and dirt sent to the culm bank averaged about 35 per cent of the total production, or about 315,700,000 tons. To this is being added about 20 per cent of a largely increased annual yield —a drain upon your resources and an item of large expense. This annual flow of fuel, amounting to more than 100,000 horse power each year, for which the more marketable article has already paid tribute—is at present a cumberer of the ground, and for this reason an additional tax upon your resources.

"The most significant indication of the progress of engineering science is the rapid increase in directions in which hitherto waste products are being turned to account, and it is to one of these directions that I would direct your attention.

"In the history of our early gold and silver mining, we find the counterpart of the culm banks of to-day. Material thrown away then produced fortunes for those who came after, and the tailings from the gold and silver mines were made to yield their precious metals at a profit. So we, to-day, are casting about to find some means of forcing the culm piles to yield in an available form their still more precious burden—the energy of the sun stored up by nature."

Uncle Sam's Guns.

Secretary Lamont in his report says that July 1, 1893, but one high-pressure gun was mounted for coast defense. By the 1st of July next we will have in position seventy high-power breech-loading guns and ninety-five breech-loading mortars of modern design, and by the following July, on completion of work already under way or provided for, 128 guns and 153 mortars. The battery of two or three of these guns takes the place of the former pretentious fort and is vastly more effective. An 8-inch gun weighs 14½ tons, is 23½ feet long, requires a powder charge of 125 pounds and throws a projectile weighing 300 pounds about nine miles. A 10-inch gun weighs 30 tons, is 30½ feet long, requires a powder charge of 250 pounds and throws a projectile of 585 pounds about twelve miles. A 12-inch gun weighs 57 tons, is 40 feet long, requires a powder charge of 520 pounds and throws a 1000-pound projectile thirteen miles. A 12-inch mortar weighs 29,120 pounds, is 13 feet long, requires a powder charge of 105 pounds and throws a filled projectile weighing 800 pounds over five miles.

The defenses now under consideration are distributed among the ports of Portland, Me., Portsmouth, N. H., Boston, Narragansett bay, eastern entrance to Long Island sound, eastern and southern entrances to New York, Philadelphia, Baltimore, Washington, Hampton Roads, Wilmington, Charleston, Savannah, Key West, Pensacola, Mobile, New Orleans, Galveston, San Diego, San Francisco, the mouth of the Columbia river and Puget sound. All of the emplacements have been located with a view of carrying on the project of the Endicott Board of Fortifications, organized under the act of Congress of March 3, 1885, as revised by the permanent Board of Engineers.

By next July there should be completed fourteen 12-inch, forty-six 10-inch, ten 8-inch and twelve rapid-fire guns and 112 mortar emplacements. And by the close of the coming year this will be increased to twenty-one 12-inch, sixty-six 10-inch, twenty-five 8-inch and sixteen rapid-fire guns and 156 mortar emplacements.

The total amount appropriated for sea-coast defenses, including cost of sites, fortifications and armament, since the adoption of the present scheme, is $25,457,000, of which more than one-third was carried by the act passed at the last session of Congress.

Mechanical Progress.

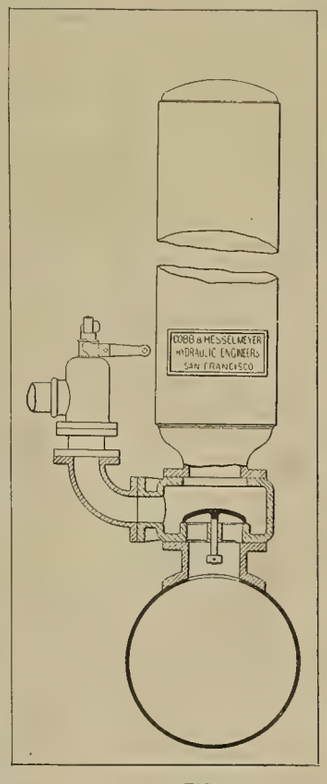
Water Ram in Pipes.

The apparatus herewith illustrated has been designed by Messrs. Cobb & Hesselmeyer, hydraulic engineers of this city, to use in connection with pipe lines conveying water for power or other uses to prevent fluctuations of pressure, which occur in such lines when the flow of water is suddenly checked or changed.

The apparatus embodies the elastic air chamber to receive and absorb the shock, and it is intended that the reaction of the air compressed above normal be prevented by introducing an automatic stop valve between air chamber and pipe line, as shown.

The water which enters the air chamber during the compression of the air therein is discharged through a suitable waste valve at the side. This valve being opened by the excess of pressure above normal, that was entrapped in the air chamber, and closes automatically when the water discharging from the air chamber has reduced the pressure therein down to normal conditions.

In Fig. 1 is shown a simple form of the apparatus, which, in addition to



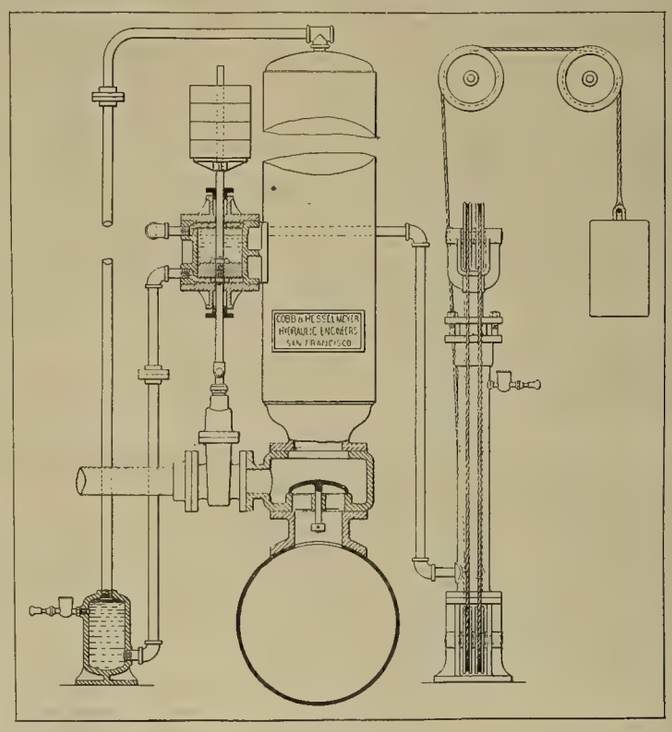
PATENT APPLIED FOR. FIG. 1.

the air chamber usually found on the line, consists of a valve chamber containing a check valve and having an outlet, the discharge from which is controlled by a pop safety valve. If water is flowing in the pipe line under normal conditions, the pressures in the line, valve chamber and air chamber are all equal, and the check valve shown is in exact balance, while the pop valve is set so that it can just resist that pressure without blowing off. If, now, from any cause, a water ram should occur in the pipe line, water will immediately rush through the check valve into the air chamber, compressing the air therein above its normal pressure and at the same time causing the pop valve to discharge.

The elasticity of the air cannot cause a rebound of water into the pipe line because of the check valve, and the increased pressure in the air chamber will cause the pop valve to remain open until sufficient water has been discharged therefrom to reduce the pressure in the air chamber to normal pressure, when the pop valve will close and the check valve be again in balance, the quantity of water wasted being exactly proportional to the energy of the ram overcome.

The sensitiveness of this form of apparatus is dependent upon the limits of pressure required to operate the pop valve, which are as low as possible under these conditions, because the excess pressure of the air chamber is not fluctuating.

Fig. 2 illustrates a more elaborate



PATENT APPLIED FOR. FIG. 2.

form of apparatus that can be arranged to be sensitive to a very small increase of pressure in the air chamber. A double-face discharge valve is shown operated by an hydraulic cylinder, but a balanced piston valve would be preferable under some conditions.

The piston of the hydraulic cylinder receives on its lower face the pressure of the air chamber and on its upper face a constant pressure equal to the normal working pressure of the pipe line. By proportioning the diameter of the working piston to the work to be done in operating the discharge valve in connection with the allowable increase of pressure in the air chamber, the desired degree of sensitiveness may be attained.

Electrical Progress.

DEMONSTRATIONS have been given lately by Lawson Tait in London of his electric hæmostat, an instrument which, as the name denotes, is intended for the arrest of bleeding in surgical operations. A platinum wire, arranged to carry a current, is inclosed in the blades of a pair of steel forceps, or any other requisite instrument, the wire being isolated by a bed of burnt pipe clay. A current of suitable voltage is turned on, the artery seized and compressed, and in a few seconds the tissues and arterial walls are so agglutinated that the passage of blood is rendered impossible. The temperature employed is about 180° F., so that it will be seen that the principle is fundamentally different from that of electrical cauterizing instruments. It is stated, says the *Electrical Engineer*, that by Tait's instrument the necessity for a ligature is removed, and a new and completely effective method is placed in the hands of the surgeon for the treatment of surface oozing.

A PROPOSAL is being discussed for supplying the Hauraki gold fields in New Zealand with electric power, to be obtained from the Huka falls of the Waikato river, near Lake Taupo, distant about eighty miles from Te Aroha, on the southern fringe of the gold mining area, and about 160 miles from the outermost point of the gold area at Cape Colville. The power would be transmitted over a "rugged and trackless mountain region," on wires "hung from point to peak, spanning its ravines, festooned around its crags, and carrying light and movement down to the bottom of its deepest mines." The water that passes over the Huka falls, it is added, "is in volume and gravitation equal to all requirements, and, so far as can be drawn from experience of enterprise elsewhere in the transmission of electrical energy, the scheme of giving motive power to all the batteries likely to be founded on the Coromandel peninsula seems entirely feasible."

THE decision of the Japanese Government to appropriate about $60,000,000 during the next seven years for the expansion of the telephone service will give that country the best system in the world. The work of construction is being rapidly carried out at various important places, the intention being to complete by March, 1898, the expansion of the service relating to Tokio, Osaka, Yokohama, as well as the new constructive work in Nagoya, Nagasaki and Shimonoseki, and to establish a telephonic connection between Tokio and Kobe.

AN electric railway for passengers is proposed for Mont Blanc. Up to a certain altitude it would be upon an inclined plane, and the ascent would be completed by a vertical shaft of a depth of 2539 meters, through which powerful electrical lifts would convey the passenger to the observatory on the summit.

AT the recent meeting of the British Association for the Advancement of Science, Prof. S. P. Thompson suggested that X rays may be the ordi-

nary means of optical communication among fire flies, and that, for that reason, Providence had not found it necessary to furnish the insect's eyes with a lens.

Practical Information.

The Amount of Water in the Earth's Crust.

W. B. Greenlee, in the *American Geologist*, writing on this subject, says:

Assuming that the earth is saturated with water to the depth of one mile, we have next to determine the relative amounts of its constituent rocks and their respective porosities.

The surface of the earth may be divided into two divisions—first, that covered with sedimentary rocks and, second, that covered with igneous and metamorphic rocks. To ascertain the relative areas, the United States and Europe were selected as typical of the land surface. The results showed that 31.2 per cent of the surface of the United States is covered with igneous and metamorphic rocks.

In Europe each country was separately divided and the percentage of the respective sums taken. This proved to be 19.8 per cent. An average of these results, by coincidence, is 25.5 cent, or, roughly speaking, three-fourths of the land surface of the earth is covered with sedimentary rocks having an average thickness of one mile.

The most accurate determination of the porosities of rocks has been made by Prof. Bauschinger of Munich. He found the average porosity of upward of 300 specimens of sandstones and limestones to be 20 per cent of their volumes. Two per cent may be taken as a low average for igneous and metamorphic rocks.

The most recent and careful computation of the respective areas of sea and land on the earth's surface is that by M. Thoulet in his "Oceanographie." This he gives as 368,000,000 kilogrammes for the sea and 142,000,000 kilogrammes for the land; or, reduced to square miles, 142,084,860 and 54,826,200 respectively. Three-fourths of the land is 41,119,650 square miles and one-fourth 13,706,550 square miles. Taking 20 per cent of the former and 2 per cent of the latter, and adding, we get 8,498,061 cubic miles of water.

Thoulet estimates the volume of the oceans at 1,347,874,850 cubic kilometres, which, reduced to English measure, equals 318,191,728 cubic miles.

The estimated amount of mechanically contained water in a section of a mile over that part of the earth's crust covered by land is thus 2.7 per cent of the water now on the earth's surface, or a layer 88 feet deep over its entire surface.

There is undoubtedly a large amount of water below one mile, but we can only conjecture as to the amount, nor does this estimate include that chemically contained. No estimate was made of the amount of water beneath the bed of the ocean, as we have no way of knowing of what it is composed or how thick the permeable layer is. This, too, would increase the total.

New Small Coins.

Within the next few months the material used in making several of our smaller coins may be changed. Congress recently directed the Secretary of the Treasury to make experiments with several new metals with a view to changing those now in use. These experiments are now about completed, and the result of them will be presented to the next Congress.

Of all the countless possible alloys to be obtained from copper, tin, nickel, and aluminum, in different combinations, perhaps fifteen or twenty may be found fairly satisfactory. It is possible that one or two of these may advantageously be brought into use for general coinage.

Aluminum, which has never yet found a place in the currency of any nation, is to be worked up into trial coins. It is also to be given a chance in new alloys. Aluminum is a metal of which but little has been known until recently, and it has been found useful in so many ways that a sort of popular idea prevails that it would be good for coins. Chief among its advantages would be its very light weight. Cents made of it could readily be distinguished from coins of the same size by this remarkable lightness alone.

The experiments at the Mint will include different combinations of nickel, copper and zinc, forming the alloys known under the head of German silver; copper and tin, which produce bronze; aluminum and copper, which make aluminum bronze. German silver has been used for coins by one of the small South American States, and proved fairly adapted for the purpose. Bronze is commonly used for coins of small value. It is doubtful if aluminum bronze in any form will be found acceptable, as it is hard to work and has a yellow, brassy appearance, resembling gold, which is to be avoided in all coins of small denominations.

It is commonly estimated that green wood, when cut down, contains about 45 per cent of its weight in moisture, but in some cases wood cut down in winter is said to hold more than 40 per cent of water at the end of the following summer. Kept for several years in a dry place, wood retains from 15 to 20 per cent of water, while that which has been thoroughly desiccated will, when exposed to air under ordinary circumstances, absorb 5 per cent of water in the first three days, and will continue to absorb it until it reaches from 14 to 16 per cent as a normal standard — the amount fluctuating above and below this standard, according to the state of the atmosphere. It has been found that, by exposing green wood to a temperature of 212° F., the loss of weight equaled 45 per cent; and, further, on exposing small prisms of wood ½ inch square and 8 inches long, cut out of billets that had been stored for two years, to the action of superheated steam for two hours, their loss of weight was found to be from 15 to 45 per cent, according to the temperature of the steam.

President Zelaya has decided to grant a charter for a railroad from Lake Nicaragua to the Caribbean sea, a distance of about seventy miles, to two citizens of New York. This road will run north of the route of the Maritime canal of Nicaragua, and is looked upon as certain to lead to a prompt development of the interior of the Republic, and should be of considerable assistance in the work of building the interoceanic waterway.

There are 119,000,000 old copper pennies somewhere. Nobody knows what has become of them, except once in a while a single specimen turns up in change. A few years ago 4,500,000 bronze two-cent pieces were set afloat. Three millions of these are still outstanding. Three million three-cent nickel pieces are scattered over the United States, but it is very rarely that one is seen.

WILL NEGOTIATE with owners or their duly authorized agents only.
WILL INVESTIGATE only thoroughly bona fide properties, either Mines, Prospects or Mineral Lands, whose owners are willing to make reasonable terms. When sending reports on properties also send terms on which you are willing to sell or lease.

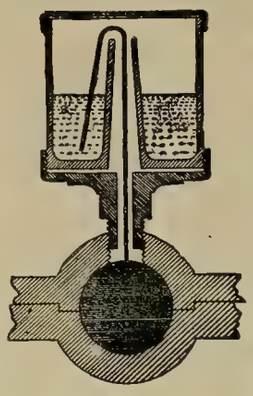
Positively Reduces Oil Bills 75 Per Cent.



THE FINCH OIL CUP.
Frictional vibration by the motion of the shaft against the point of the wire causes the oil to flow, and that this flow is not produced simply by syphonic or capillary action but by frictional vibration is proven by the fact that if the wire does not rest on the shaft then the oil will not flow When the machinery stops the feed stops, therefore **the Finch Cup is Absolutely Automatic, Feeds Enough Oil and No More, Prevents All Waste, Needs Very Little Attention.**

Read One of the Many Testimonials:

UNION GAS ENGINE CO. SAN FRANCISCO, July 19, 1894.
During the past three years we have used your Cups for the crank shaft bearings of our engines, and also on all bearings of shaftings and tools in the shop. Our engines now *require no attention* except to fill the Cups occasionally, and therefore we can cheerfully recommend the Finch Cups to any one as *being the best in the market.*

K. J. McHUGH, 51 Fremont St., San Francisco, Cal.
General Agent for Pacific Coast. Send for Circular.

HORACE F. BROWN, CONSULTING ENGINEER.

Special attention given to preparing plans for the Chlorination and Bromine Processes of Treating Gold Ores.

PATENTEE { Brown's Complete Automatic Mill Process. Brown's System of Mechanically Stirred Roasting, Cooling and Conveying Furnaces, Etc.

1607-8 Manhattan Building, Chicago, Illinois.

The General Gold Extracting Co., Ltd.,
PELATAN-CLERICI PROCESS.
Patented in U. S. and Other Countries. Capital, £100,000.
London Head Office.....8 Drapers Gardens.
Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.

This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.
Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.

F. CLERICI, Manager for U. S.

KENDALL GOLD AND SILVER EXTRACTION CO.
THE KENDALL PROCESS is the most efficient method of using cyanide for the extraction of precious metals from their ores. Wherever this process has been adopted the result has been increased percentages of values recovered and saving of time. Material reduction in consumption of chemicals has also been demonstrated with respect to several classes of ores.
All ores, without exception, amenable to cyanide treatment can be treated to better advantage by the Kendall Process. This can be accepted as an axiom.
The manager of one of the largest mines in the Mercur District, Utah, wires: "We now begin to understand dioxide process; last twenty days treated 220 tons per day of $26.50 ore, average of all tailings samples $0.83."
Owners of mines and reduction works can obtain full information on application to
KENDALL GOLD AND SILVER EXTRACTION CO.....47 Broadway, New York City.

TURBINE AND CASCADE WATER WHEEL
Adapted to all Heads from
3 Feet to 2000 Feet.

Coast Industrial Notes.

—Last week the new steamer Humboldt was launched at Eureka.

It is proposed to start up again the terra cotta works at Elsinore, Los Angeles county.

—A signal service station has been located in San Jose by the Department of Agriculture.

A carload of fine horses is to be shipped from Santa Barbara to the city of Mexico for sale.

The California Powder Company is putting a $300,000 addition to its Santa Cruz works.

—During November San Francisco corporations paid a total of $393,964 in dividends, against $296,406 for the same month in 1895.

A number of irrigation districts in the southern part of the State propose to make a fight for the annulment of the bonds issued on the ground of irregularity in the organization.

It will probably be agreed by the Alameda county Board of Supervisors and the Southern Pacific Company to join in building a steel bridge across the estuary for trains and other travel.

—Over half the business portion of the town of Leavenworth, on the Great Northern road, in Okanogan county, Washington, was destroyed by fire last week. The loss was about $50,000.

—The California Beet Sugar Estate and Land Company, the English company owning the Chino ranch, have issued bonds amounting to $750,000, secured by a trust deed to their property. It is intended to enlarge the present plant and otherwise improve the property.

—Last week the seaport towns of southern California experienced remarkably stiff gales from the northeast for forty-eight hours, which in many instances caused considerable damage to local shipping interests. Nearly all the wharves south of Point Conception were more or less injured.

—What is believed to be the first sawmill in the world run by directly-transmitted electricity began work this week at the sawmill of the American River Land & Lumber Co., Folsom, Cal. Everything in and about the mill is run by electricity. The mill has a daily capacity of 120 M feet.

—By virtue of first mortgage bondholders' proceedings the Seattle Consolidated Street Railway, consisting of about thirty-five miles of electric railway has been sold to Judge Thomas Burke, representing the bondholders, for $139,601. There was a total indebtedness of about $600,000 against the property.

—A proposition has been made in the Chamber of Commerce of San Diego looking toward the establishment of a small steamer line between San Pedro and San Diego. The object is to afford competition against the Southern California Railway, which is alleged to discriminate against San Diego in the matter of tourist travel during the winter months, when it is heaviest.

—At Los Angeles the building operations of the year to December 1st aggregated $2,748,005 in value as compared to $3,885,883 last year. No public buildings of any sort are embraced in the record. More attention has been paid during the year to dwellings and homes than to business blocks. The total number of permits, exclusive of those in November, is 2163, as against 2415 issued last year.

—A Tacoma syndicate which about five years ago acquired valuable coal properties five miles south of Hamilton, in Skagit county, Wash., have been quietly developing the mines since that time, intending to erect a coke-making plant when times improved. They now propose to go ahead. Arrangements are being made to build a six-mile flume from the mines to a point on the Skagit river several miles below Hamilton, where coke ovens will be constructed. Running the coal through the flume will thoroughly wash it, thus saving expense for that process.

—An estimate of the orange crop for the coming season, procured by the freight departments of the Southern Pacific and Southern California Railroads, would indicate that the shipments will greatly exceed those of any preceding season in the State's history. The estimate is 8375 cars, of which 2700 are in Riverside, 1800 in Los Angeles and vicinity, and the remainder in the outlying districts. It is stated that the crop will come fully up to this estimate unless adverse climatic conditions ensue. The crop last season aggregated 7000 carloads. The estimate for the coming season means 2,512,500 boxes.

—The State Highway Commissioners in their report state that the expenditures on roads throughout the State for 1894 and 1895 were $1,789,259.64, and for the period from 1885 to 1895, inclusive, the amount was $17,919,324.26. The natural conditions—climatic, geological and topographical—are all favorable to the construction of roads, though at the present time there are scarcely any permanently constructed highways in the State. The reason for this seems plain, for the work has been carried on without method or system, and money set aside for the purpose has been wastefully and injudiciously expended.

—Reports from sixteen of the leading export mills of Washington, as collected by the *West Coast and Puget Sound Lumberman*, show cargo shipments of 37,727,012 feet of lumber and 4,149,885 lath during the month of October, of which 14,494,547 feet of lumber and 83,650 lath went foreign, showing a gain of 4,000,000 from September, though foreign shipments were 5,000,000 feet less. The total cargo trade for ten months has reached 293,155,984 feet. Eastern shipments of lumber for October were 583 cars or 9,328,000 feet, a decrease of nearly 1,000,000 feet from October last year, though for ten months shipments have reached 43,168,000 feet, against 76,495,000 feet during the same period of 1895. To November 1st the total cargo and rail trade for the State aggregated 3,863,239,984 feet. October shingle shipments were 1,324 cars or 214,480,000 pieces, against 225,000,000 for the corresponding month last year, while the total for ten months has been 2,010,720,000, an increase of 110,000,000 as compared with the same months of 1895.

Personal.

M. J. FARRELL is the new superintendent of the Kate Hayes mine at Grass Valley, Cal., which is to be reopened.

THE British Home Secretary has ordered the release of Dr. Jameson, the South African raider, from Holloway jail on account of his health.

B. MCDONNELL, who has been acting superintendent of the Tuolumne mine in Amador county, has been appointed general superintendent.

HERMAN THOFEHRN, formerly manager of the Anaconda refinery in Butte, is about to go to China to secure copper mines for the Government.

T. A. RICKARD, State Geologist of Colorado, has been appointed consulting engineer of the Searls properties in the West, vice W. J. Clark, resigned.

D. B. HUNTLEY, superintendent of the De Lamar (Idaho) mine, has lately been visiting in his old home, Oakland. Mr. Huntley is a graduate of the College of Mines of the University of California.

LOUIS CHEVRILLON, who represents the North American Exploration Company of New York and Paris, and who has been looking at mines at Mercur, Utah, has come on to California in the interest of his company.

CAPT. AUGUSTUS F. RODGERS of the United States Coast and Geodetic Survey has returned from Washington and will proceed to Los Angeles to meet Admiral Walker and other members of the Deep-Sea Harbor Commission.

Commercial Paragraphs.

THE Pacific Mining Machinery Company has shipped a Pacific amalgamator to the M. M. & R. Co., Warrington, North Carolina, and one to the Arizona Mineral Development Company, Prescott, Arizona.

THE Union Gas Engine Co., 314 Howard street, San Francisco, received an order last week for two 20 H. P. gasoline engines, to be shipped with two air compressors to Mexico, to be used in mines owned by Boston parties.

THE Gates Iron Works, Chicago, Ill., have added another feature to their present extensive plant. It is only recently they have commenced to build high-grade 4-valve Fischer engines, and at this early day have a number of orders on hand, which means giving employment of more men.

THE date for holding the second annual convention of the National Association of Manufacturers has been fixed for the 26th, 27th and 28th of January, 1897, at Philadelphia, Pa. It is expected that this convention will be one of unusual interest, as the president will submit a report of the first full year of practical work in the lines mapped out by the original convention held in Cincinnati, January, 1895. This report will describe the initiation of practical movement in the direction of the cardinal principles originally adopted by the Association, and very gratifying success in various directions will be noted. It will then devolve upon the convention itself, which will embrace the recorded members holding certificates in the Association, to pass upon the work which has been done and to indicate a policy to be pursued by the president and executive committee during the next year, in which year it is confidently expected that existing conditions will enable the Association to make vigorous progress.

Recently Declared Mining Dividends.

Idaho, British Columbia, $20,000; payable Nov. 21.

Ontario, Utah; $15,000, payable Nov. 30th. Total to date, $13,355,000.

Swansea, Utah; $5000, a regular monthly dividend, payable Dec. 3rd.

Boston & Montana Company, Montana; $450,000, payable Nov. 20th.

Moulton Mining Company, Montana; $20,000, or 5 cents a share, payable Dec. 1st in New York.

Cariboo Mining, Milling and Smelting Company, British Columbia, $16,000; payable Dec. 7. This makes a total of $125,401.34 since Feb. 1895.

Recent California Mining Incorporations.

Little Hope Gold Mining Company; W. M. Hall, E. H. Muller, W. S. Miller, K. A. Hughson, G. E. Brinkerhoff, G. D. Gray, R. S. Moore.

Noche Buena Gold Mining and Milling Company, San Francisco; F. H. Prentiss, Chicago; S. Ephraim, T. J. Ryan, San Francisco; J. L. Field, R. A. Friedrich, Alameda; capital stock $1,000,000—$500 subscribed.

Obituary.

PETER VAN CLIEF, one of the Supreme Court Commissioners, died last Sunday in this city, aged 78 years. Judge Van Clief in 1858 was appointed by Governor Weller judge of the old Seventeenth district, including Plumas and Sierra counties. In the later seventies he took a leading part as counsel for the miners in the debris fights. He leaves a widow and three daughters.

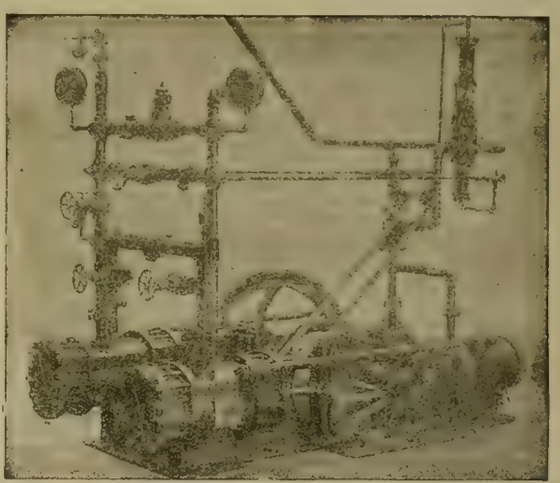
DOUBLE PIPE AIR COMPRESSOR.



This is a cut of the Double Pipe AirCompressor, the Compressor that is guaranteed to save 30% in power over any other make. It is cheapest to buy, cheapest to carry about and cheapest to run. If your fuel or water costs you anything, you want this Compressor. If you can get railroad freights free, and can carry machinery to your mine without cost, and your power costs you nothing, any make of Compressor will do you. You will be under no necessity to write to PNEUMATIC POWER CO., at 306 Pine St., San Francisco, Cal. We could save you money, though, in cost of foundations, as our Compressors are half the size of other makes.

Mining Summary.

CALIFORNIA.

Amador.

Ledger: The Bellwether Gold Mining Company has its shaft down 255 feet in depth and going down 50 feet per month.

The property at Irishtown worked by Robert Reed for Tautphaus & Stone of San Francisco is looking well, and the machinery recently put on the Belden mine by the same parties has been moved there.

Superintendent Peters of the Good Hope mine, at the edge of town, has put five stamps of his 10-stamp mill in operation. They commenced to drop Monday on fine ore.

Republican: Five of the ten stamps of the mill at the Good Hope have been started. The dump pile, which has been lying there for twenty years, is being passed through the mill. It consists of a mixture of quartz, slate and gouge. It can be crushed at trifling expense, and, if it yields from $2 to $3 per ton, can be milled at a profit. There is, perhaps, between 400 and 500 tons on the dump.

Calaveras.

Chronicle: The Gwin mine shaft is down 1445 feet. A station is being cut at the 1400-foot level. Work on the 1200 and 1300-foot levels will be continued until the mill is ready to run, which will be in about two weeks. A 120-light dynamo is being put in place for furnishing lights to the mine and mill.

A contract has been let by the California Exploration Company to Charles Rivara to run several hundred feet of a tunnel at the Gottschalk mine.

Prospect: Gulch miners are now making all necessary preparations for sluicing and ground sluicing. Some good-sized nuggets have already been found.

On the Western lode, near Campo Seco, the Jack Howard mine is said to have rock at present that will go $100 to the ton.

The Dean Brothers' mine, the McAfee, the Eproson, the Brown, the Donner, the Dolan, the Leader, the Anna, the Shiloah Pocket and the Slate Creek all show good milling ore.

The new shaft at the Utica will be three compartments, 8x17, or 5x14 in the clear, and will go down 2000 feet, intersecting a drift of the 1300-foot level. Its cost will be $30 a foot, or $60,000, and will insure ten years' prosperity for the camp.

The work of enlarging the shaft of the Lightner mine to a three-compartment shaft is going on night and day. As soon as the old shaft, which is less than 70 feet in depth, is enlarged to its full depth sinking will be commenced. The ore body is over 40 feet in width and, like the Utica and Stickles mines, the ledge widens as depth is attained. No work has been done on the Lightner property since 1857. The sulphurets, which contain the greater percentage of the gold, were then permitted to run off with the tailings.

The richest pay chutes discovered in the Utica and Stickles mines, it is expected, will be tapped in the Ghost mine at a depth of 1800 or 2000 feet, and it is the intention of the owners to put the shaft down deep enough to reach these chutes before opening up a general system of stoping.

Citizen: At the Quartz Glen mine, near Rich Gulch, Ferris & West have 17 men employed getting out quartz, and the 20-stamp mill is working on good milling ore. In the 800-foot tunnel a ledge of good ore 10 feet in width has been encountered 450 feet from the surface. The upraise from the 1000-foot tunnel, which is 450 feet above the tunnel mentioned before, has tapped the old Foote & Thompson works 160 feet above the level of the tunnel, and a large body of ore is to be seen the entire distance.

El Dorado.

Mountain Democrat: At Fairplay, at the Uncle Sam mine, a large amount of work has been done, and the report is that pay gravel has been struck.

At the Gardner & Morton mine, adjoining the Uncle Sam, they are taking out plenty of pay dirt.

T. Elliott, who has the Humphries quartz mine bonded, has let a contract for sinking 100 feet deeper.

Gazette: The Big Sandy is shut down to add more pipe to the lines and rig up for sinking again.

The Hard Scrabble is again shut down—this time for good.

Inyo.

Register: A strike has been made in the Mammoth mine. The vein has been cut for 20 feet and the wall is not found yet. Assays of the ore give over $100 per ton. Col. Judd has gone to Chicago. S. D. Crosscup will set up the concentrating plant.

The copper claims of Sanger & Danielson, near Saline Valley, are showing up in good shape and, it is claimed, show permanent value.

Smith & Best are taking out pay ore at the Molus mine.

Dr. Doyle of Chicago has completed negotiations for the purchase of the Wild Rose mining property, above Benton, from McNamara Bros. & Dowd. The purchase price is said to be $10,000.

R. J. Whittaker has finished a run of nineteen tons of ore from the Red Jacket, in Tule canyon, at Sam Piper's arrastra on Cottonwood creek. The returns were far in excess of expectations. The ore was hauled a distance of thirty miles.

Kern.

Californian: At Garlock the battery blocks and other timbers, as well as part of the machinery, are on the ground for the new 10-stamp mill.

They are starting a new tunnel in the Rand mine, also of the group, to connect with the others. There are several other mines in this group, employing in all over forty miners at $3 per day and the foreman at $3.50.

The Big Blue at Knoxville, which was extensively worked many years ago, is reported to have been sold and will be opened up soon.

The cyanide plant belonging to Dr. Marshall & Co., which is now located on the Mojave river, is to be removed to Garlock.

The Walkover, belonging to H. Watson, was bonded a few days ago to a company for $10,000. They will begin work at once developing.

The Olympus is down 100 feet, with 200 feet of a drift on the 50-foot level, and with a big body of ore above them, running from 6 feet to 25 feet in width.

The Yellow Aster, also belonging to the Burcham property, is in 200 feet on a level with a winze about 30 feet.

Mariposa.

Gazette: James Deatrich has bonded the Elizabeth and Mayflower mines of Barney Kane and proposes to develop them.

Nevada.

Union: An English syndicate is negotiating for the purchase of a group of quartz mines in Willow Valley district.

Telegraph: Farrell, Gambel and others have a bond on the Kate Hayes Hill mine and work will be commenced immediately. The shaft is considerably caved and the first work will be to put it in repair, and when that is done hoisting and pumping works will be placed on the mine and it will be thoroughly developed. The company who are to operate this property consist of foreign capitalists. The Kate Hayes is one of the early day mines of Grass Valley. It was worked in the sixties, the records showing that the ore paid on an average from $35 to $50 per ton. In 1866 work ceased for some unknown reason and nothing was done on it until a couple of years ago, when a local company cleaned out the shaft and got ready to open the mine, but their capital was too limited to sink.

Placer.

At the Occidental mine at Grizzy Flat, near Iowa Hill, Supt. W. Cameron has a force of men busy sinking a shaft. Arrangements have been made for placing a 50 H. P. dynamo at the mine. The mine buildings will be lighted by electricity, and telephone connection will be established with Iowa Hil .

Plumas.

National-Bulletin: As a result of the late heavy rains a few sluice miners in the vicinity of La Porte and Gibsonville have gone to work. The same is true as to other parts of the county.

Riverside.

Southwest Miner: The Leon mine, near the center of the county, is said to have enough good ore exposed to keep a 20-stamp mill in operation for a number of years.

The Pinon group of mines near Indio, owned by Woodworth and Marshall, are showing up well. A body of rich ore was opened up in one of the mines last week.

The Santa Rosa Gold Mining and Milling Company at Perris has changed its name to Grand View Mining and Milling Company. They employ forty men, and ten stamps are kept running all the time. The ore is said to be very high grade. Their new double-compartment shaft on the upper end of the property is now down 280 feet and they have put a steam hoist on it. The entire place is lighted by electricity.

It is expected that Day & French of the Golden Chariot at Perris will start up again.

San Bernardino.

Southwest Miner: The Gold Mountain mine in Bear valley, owned by E. J. Baldwin, was about six months ago bonded to a syndicate. A few days ago the new superintendent sent word to Thomas Worden of this city to hire fifteen good miners at $2.75 a day for an all-winter job in the mine. A 5-stamp mill will at once be put up and the ore taken out in developing the property this winter will be sufficient to keep the plant in steady operation. If the mine is what the purchasers believe it to be, a mill with at least 100 stamps will be erected early in the spring. This mine was worked on an extensive scale in 1874-5, but during a temporary shutdown early in '76 the 40-stamp mill was destroyed by fire and was never rebuilt.

At the Crowell & Morrow mines, out in the desert from Hinckley, a quantity of ore shipped to the smelter shows good returns.

On the Providence the shaft is down 50 feet and shows a clean vein of ore 4½ feet in thickness. Regular shipments of ore will be made from now on.

San Diego.

Ramona *Sentinel*: Men are being put on at the Hubbard mine.

The rock from the Hassayampa went $22 per ton; that from the Alpha mine $16 per ton.

Stanley and Reeder have made a strike of silver ore to the east of the Golden Chariot, which assays 40 ounces of silver and $4 in gold per ton.

Shasta.

Searchlight: The Cleveland Consolidated mine on Bully Choop was recently examined by an expert for an English syndicate, and as a result a deal is pending that involves the payment of $500,000. R. G. Hart of the Texas Consolidated is one of the principal owners. The development of this property will mean much to the permanent prosperity of this mining section.

The Colorado people interested in gravel mines on the Klamath are backing the extensive preparations made for working the Doeblin mines near Muletown. These deposits have been worked during the winter months for years by means of surface water. Doctor Simons and his associates purchased the property about a year ago. Fourteen miles of ditch and pipe lead water from Brandy and Boulder creeks to the gravel beds, and in a month active washing will commence. When in operation 2000 miners' inches of water will be available. The debris will be impounded in Jackass Flat basin, where a dam has been built, approved by the Debris Commission. At present over sixty men are employed.

On Harrison gulch, the new 10-stamp mill being erected by Captain Roberts on the Edison location will be completed next week, and from that time on the two mills treating twenty tons daily will be kept in constant operation.

W. A. Boswell and Wm. Johnson are reported to have struck a vein of rich ore about three miles from Harrison gulch property.

Sierra.

Mountain Messenger: The Sierra Buttes Consolidated Mining Company has been incorporated by W. H. Martin, P. Tautphaus, E. F. Liebrich, F. Boeckmann and R. Martin to work the celebrated old mine of the same name. It is equipped with a good plant and an excellent mill will be put in first-class repair.

The North Fork Mining Company is now running three mines in Sierra county, the North Fork, Lucky Dog and Bald Mountain Consolidated, employing 120 men.

Siskiyou.

Journal: D. W. Jones' ledge, Quartz valley, is producing ore averaging $100 a ton.

The snow last week, which fell to the depth of a couple of feet in the high mountains, is furnishing plenty of water for the smaller mines to operate, and insures them water for some time to come.

The Seattle Placer Mining Company's claim, on Thompson creek, is being worked.

The Katie May mine, on Greenhorn, is also being worked by Bailey & Carrick.

Trinity.

Journal: The owners of the Lappin mine, Brady, Cochran and Tourtellotte, recently made a test crushing in an arrastra of three tons of rock which milled $100 a ton. There is an abundance of the same rock in sight and the mine promises to be among the best on Deadwood. A stamp mill will be put up in the spring.

The Strode quartz mine at Trinity Center has closed down for the winter after a successful season's run.

Tuolumne.

(Special Correspondence). — The Consolidated Eureka (Dead Horse) mine was shut down last month, owing to the water company shutting off the water to repair the ditch.

Four men have been at work for the last two weeks repairing the shaft at the Hunter mine.

It is rumored here that Mr. Floyd of Soulsbyville is going to start the Star King mine before Christmas.

At the Modoc mine two shifts are at work and the tunnels are in, respectively, 150 and 90 feet. Both tunnels are being run on pay ore and when completed will open up 500 feet of backs on a 14-foot vein.

The Mammoth mine has been bonded to C. Meyers, who, it is stated, will proceed to put up a large plant on the property as soon as it can be got there.

Carters, Nov. 30, 1896.

Union-Democrat: At the Golden Rule the shaft has reached the 600-foot level and operations have been temporarily suspended until those interested decide upon the course of underground work to be done this winter.

At the App the mill started crushing last week after a shut-down of nearly a month for want of water. They are running through about sixty tons per day, and the returns show the rock to be of a higher grade than was expected.

At the Belleview the mill has started up again, running steadily. The mine is now in good condition for the winter.

At the Rawhide the big Cornish pump is being placed in position. Only twenty-five stamps are dropping at present, owing to a lack of electrical power.

The Star has started again after a shut-down for want of water, during which a new three-ton capacity chlorination plant was put in, and also a duplex air compressor, capable of supplying six drills.

At the Alameda a new steam hoisting plant and an air compressor of four-drill capacity have been ordered. The present shaft will be sunk an additional 400 feet.

At the Soulsby in less than two weeks the new hoist and mill, as well as the air compressor, will be ready for work and stoping from the 200-foot level will commence.

At the Dutch the work of enlarging the shaft is going on. They are working up from the 400-level and are now at the 200.

At the Arbona as the drifts are advanced the ledge continues to show up in better shape.

Work on the shaft at the Lady Washington is progressing.

The recent rains have caused a general revival in all classes of mining. Every mill that was idle in consequence of a lack of water has resumed.

W. R. Gillis has sold the Thompson hill mine, near Tuttletown, to a San Francisco company for $5000.

NEVADA.

Pioche *Record*: The April Fool Gold Mining and Milling Company, with a capital stock of $500,000, represented by shares of stock of the par value of $5 each, has filed articles of incorporation. The April Fool was located on April 1, 1892. Since that time between 4000 and 5000 feet of work has been done, the lowest tunnel giving the owners a vertical depth of 350 feet from the surface. The ledge is from 20 to 70 feet between walls, while the work thus far has been confined to one of a number of fissures that have been exposed.

De Lamar *Lode*: Work still continues on the Sunrise, and the parties in charge are encouraged with present appearances.

Work is developing a fine body of good silver ore in the Old Timer mine.

A strike is reported in the Jumbo at De Lamar, which is now under a bond that is shared by De Lamar, Nichols & Griffiths. It is said that the ore shows $35 in gold to the ton.

White Pine *News*: Work has been commenced on the Jim Fisk mine, Robinson district.

HUMBOLDT COUNTY.

Reno *Gazette*: Within two hours drive from Mill City there are a score or more of partly developed gold mines, lying idle for the want of capital, and which may be purchased at a very reasonable figure, or bonded on easy terms. The prevailing idea seems to exist in the minds of strangers that the mining industry of Nevada is confined exclusively to silver, which is a great mistake. While it is true that ten or fifteen years ago little or no attention was directed to gold mining or prospecting in this State, the gradual decrease in the value of silver bullion on the markets has been the means of causing miners to turn their attention to gold prospecting, which has naturally resulted in the development of large numbers of gold properties throughout the State, which is especially noticeable in this county. A few years ago silver predominated, while to-day there are at least three gold mines to one of silver. In some instances they contain gold, silver and lead; the majority, however, are free milling.

The purchasers of the Hendra mines at Dun Glen have recently erected a mill upon the property and will commence operations on the 20th inst. There are between 7,000 and 10,000 tons of available ore in sight, which averages $9 per ton in free gold. The ledge throughout the greater part of the development measures 4 feet in width.

The Smith mine on the same lode has been bonded to H. J. Humphreys for $10,000. It is a newly developed property, having a tunnel 200 feet in length, on a 4-foot ledge, which mills $7 per ton in free gold.

Recent developments on the Mammoth group, in Star district, owned by Woolcock and Phillips, disclose an immense body of gold and silver bearing ore, the ledge matter being from 150 to 200 feet in width, the outcroppings of which can be readily traced for a distance of a mile and a half. It assays from 10 to 110 ounces in silver and from $3 to $20 per ton in gold.

LINCOLN COUNTY.

Thirteen miles southwest of Bunkerville, in Lincoln county, the Copper King mining district has been organized, the area embracing the copper mine owned by Charles D. Lane and Alvinza Hayward, owners of the Utica mine. J. C. Stewart of Camp Vida, Lincoln county, is recorder of the new district.

OREGON.

Jacksonville *Democratic Times*: Work has been suspended at the Ashland mine owing to too much water. A pumping plant will be put in soon.

The Hope mine in Ashland district has been bonded to Thos. James, acting for Eastern capitalists.

Work has been commenced at the Hampton-Lewis mines on Galice creek with one giant. Two more will be put in operation as soon as there is sufficient water.

Baker City *Bedrock-Democrat*: The Bonanza mine proposes to put in twenty additional stamps about May 1st, making forty stamps in all. The last cleanup yielded $20,000, the result of sixteen days' run with twenty stamps.

Grants Pass *Observer*: Charles Stratton has commenced operating his hydraulic mine on Williams creek.

M. W. Bates, of Duluth, Minn., is investigating the nickel mines near Riddle. He represents a company that desires to buy the property.

T. James has bonded the Hope and Shorty mines and has made a first payment of $2,000.

Jacksonville *Times*: The smelter is running at the Illinois copper mines and some good matte is being turned out.

Four monitors and a force of thirty-five men are employed at the Hampton-Lewis mine on Grave creek. Work has been going on day and night, but cold weather is now interfering.

The Noonday Mining Co. of Bohemia district, Lane county, have started their 20-stamp mill.

WASHINGTON.

Spokane *Chronicle*: Some attention has been called to the Clearwater district this year, principally in placer mining. In early days the headwaters of the St. Joe river, as well as a number of other placers in the Bitter Root mountains, were scenes of great excitement.

BRITISH COLUMBIA.

Nelson *Tribune*: The following are returns of shipments of bullion matte and ore from the mines and smelters of southern Kootenay for the week ending Nov. 21st.:

BULLION AND MATTE.

	Pounds.	*Customs Value.*
Hall Mines smelter, Nelson, matte	160,000	$ .....

ORE.

	Tons.	*Approximate Value.*
Slocan Star mine, Sandon	40	$ .....
Idaho mine, Slocan	40	.....
Two Friends, Springer creek	21	.....
Goodenough mine, Slocan	19	.....
Rambler mine, Slocan	16	.....
Antoine mine, Slocan	13	.....
Washington	16	.....
Total for the week	245	$34,870
Total so far for 1896	26,248	$2,911,275

Trail Creek *News*: The Robert E. Lee Company has placed an order for a complete plant, consisting of a 10-mill piston inlet air com-

pressor, hoist capable of sinking 500 feet and a pump capable of pumping for the same distance and a complete outfit of boilers and drills.

The Mayflower will install a first-class hoist on the main shaft, which is now down 70 feet below the level of the tunnel.

The Nest Egg people have ordered a four-drill compressor, a hoist, drills, boilers and pumps, and intend opening up the mine thoroughly.

The Norway, adjoining Trail, has passed into the hands of an Eastern syndicate.

At Slocan the owners of the Noble Five expect to take out 100 tons of ore daily. They are now getting ready for the concentrator.

Ore is being shipped steadily from the Ruth, about fifty or sixty tons a day going out to the smelters.

Rossland *Miner*: An option has been given to D. D. Book & Co of New York on the Highland group and the Union mine.

Ore has been found in the lower tunnel of the Kootenay, assaying $23 in gold.

The I. X. L. mine, the first free milling property to be located in Rossland, is to be worked on a large scale. John S. Baker of Tacoma has incorporated a company in Spokane to take over the property. In the spring a compressor and 10 stamp mill will be erected on the property.

The Le Roi mine is employing about 120 men and shipping daily about 125 tons of ore. New ore bodies have recently been opened up on the 200 and 300-foot levels. At the bottom of the shaft, at the 500-foot level, a chamber is being cut out for a station. The men have cut 26 feet across the vein, all in ore, and with no sign of either wall.

Spokesman-Review: Over 100 men are at work on the mines at Anaconda and a great many locations have been made.

The Deer Park Company has just decided upon the immediate installation of a four-drill compressor, hoist capable of sinking 500 feet, and all the necessary boiler power to keep such a plant in operation.

Kootenaian: The Brennard group of claims, among the first located in the Slocan and which were at one time bonded at $100,000, has passed into the hands of a company made up of Northwest Territory and local men, which immediately began active development work.

Ashcroft *Mining Journal*: The Glengarry and Mayflower, on Cayouse creek, owned by Chisholm and McDonald, have been bonded to Cecil Smith for $1000.

Nelson *Tribune*: The Consolation placer on French creek, with four men at work, is taking out $250 to $300 per week. The gold is not very coarse but some nuggets go about $15, which are at present the largest obtained, the average size being $5 and $6. More men are to be put on right away and work pushed on the main channel, which is expected will give better results.

ALASKA.

Mining Record: The three lode claims known as Seek-no-further, Old Cattaraugus and Merrimac, owned by Phil Starr, Martin Sabin and Marion Thomas, have been bonded for $45,000 to Chicago parties. These claims adjoin the Bald Eagle at Sum Dum and are probably on the same ore vein.

The recent transfer of the Horrible and Mexican ledges at Berners bay to Louis Nicolai will give impetus to quartz mining in southeastern Alaska. Nature exposed the ledges for a distance of more than 1800 feet, while a depth of over 500 feet is visible on the face of the bluff through which ledges run. Each ledge will average a width of fully 5 feet. The expert employed by Mr. Nicolai in the examination of the properties has reported that of the very numerous assays made the lowest return was $8 and the highest $63 gold to the ton. The timbers for a 20-stamp mill will be framed at some point on the sound and its erection will begin about February 1st. The purchase price of the property was $90,000 instead of $60,000, as has been stated.

News: With the completion of the furnace now in course of construction at the Treadwell chlorination works, and the one which is to be built in the annex, the plant will contain six reverberatory furnaces. To each furnace there are four leaching vats, two intermediate vats and four precipitating vats, the first-named being fitted with covers which are so arranged by Mr. Ott as to prevent chlorine gas escaping. This removes a serious objection which laborers have always had to employment in reduction works where chlorine gas is used. Until very recently it has been the custom to allow six hours to each charge. At the beginning of last month Mr. Ott inaugurated the plan of drawing every 5½ hours, and the result has been that each third day an extra charge is gained, which in a month amounts to fifteen or eighteen tons, and at a cost of no more fuel or any additional labor. By the old plan the furnaces averaged 125 to 130 tons a month, whereas they now handle from 140 to 145, the one in which the sulphurets from the Mexican is treated handling 144 tons during October. Another improvement which will shortly be put into effect is the heating of water before it is introduced into the leaching vats.

Work on the Starr-Edwards mammoth ledge on Nevada creek, under bond to Duncan & Corbus, continues. It will require a drive of 900 feet to cross the ledge. The showing made so far is excellent.

UTAH.

Salt Lake *Tribune*: Charles Lammersdorf has secured a controlling interest in the Sevier, and it is expected that improvements that will double the output will soon be made.

Manager Quealey of the Wonder reports the shaft on that mine now at a depth of 520 feet.

The great Sioux-Ajax tunnel, by which the backbone of the Tintic range is being pierced, has now advanced over 1400 feet, and it is not unlikely that prospecting off its level will begin in the next few days. It at least affords an avenue through which to intelligently and economically explore about 200 acres of ground, much of which should be made productive within the next year.

At Eureka ore has been found in the workings of the Grand Central lying between the Mammoth on the east and the Centennial Eureka on the northwest. The ore find was made on the 200 level, although the company has sunk down 700 feet and drifted northeast 1000 feet, at an expense of $110,000, and it is expected to cut the ore bodies by the lower drift when it is run far enough in the same direction.

The North Star mine sent 1000 tons of ore to the Sioux mill at Mammoth and had it milled, resulting in an average product of $9 in gold and 13 ounces of silver to the ton. This makes the great ore bodies in the North Star a good milling proposition, and the company may before long put in a mill.

At Mercur work has just been commenced in the Buckeye and Victor properties by Eastern parties who have bonded them.

At the Herschel they have made a strike, having run into the ore body after driving a tunnel over 1000 feet into the face of the hill. The ore is of the same character as that found in the Sacramento.

At the Geyser the addition to the mill is nearly completed, and the new tanks will be set up and put in operation within a short time.

People representing Colorado and Philadelphia capital have bonded the Copper King properties, owned by Maxwell, May, Young and King, in the Big Indian district, for $80,000: $9000 to be paid down in thirty days and the balance in installments.

M. R. Hunt and his associates have acquired a controlling interest in the Alaska at Silver City. Development will begin at once, with J. R. Price as superintendent.

Bingham *Bulletin*: Manager Schmidt of the Dalton & Lark states reduction works of some sort and of at least 100 tons capacity will be in operation within six months on the old Lead mill site.

Warner & Frisbie, successors of Bero & Peterson in the Zelnora lease, are this week taking active measures to get the Clipper Hill bonanza in shape for working through the winter.

IDAHO.

World: The North Star mine on Shaw's mountain has been tapped at a depth of 300 feet. The ledge is 5 feet wide, with a 14-inch pay streak, and the ore assays $88 in gold per ton. The owners will put up a 5-stamp mill.

Western Mining World: P. N. Nichols, of New York, has secured the Ibach and Suydam properties on Indian creek. The ore so far is free milling and of a value of from $12 to $20 per ton. Negotiations are pending with the Risdon Iron Works for a 10-stamp mill.

MONTANA.

Mining World: The Kennedy mine at Clancy is being developed by Tom Cruse of Helena.

It is reported that the ore in the recent strike in the Broadwater mine, at Neihart, runs from 1560 to 2500 ounces to the ton. More miners have been placed at work, 100 being now employed, and 40 more will soon be placed at work upon the new discovery.

Miner: The work of sinking the shaft of the Colusa Parrot mine to the 1300 level has commenced. The mine is now being worked at the 1100 level.

The Vulcan mine, which has been idle for several years, will probably start up in a few days and a large number of men will be employed.

Garver and Bunnell have sold the G. & B. mine, on the middle fork of Warm Springs creek, to Thomas Cruse and W. J. Sweeney. The terms of the sale are reported to be $50,000 cash.

The Golden Sceptre Mining Company at Quigley, which has assigned with debts of $285,000, may again start up.

Spokesman-Review: In the Yakh district the force on the Goldflint has been increased. A 400-foot tunnel is being run to tap the lead at a depth of 150 feet.

There is strong talk of a concentrator being erected early in the spring to handle some of the refractory ores in the camp.

Development work will be pushed during the winter on the Blue Bell, Tough Nut, Good Hope, Kootenai and the Kokonee.

SOUTH DAKOTA.

Black Hills *Times*: The Union Hill Mining Company have men prospecting and developing the property of the Washington Consolidated Mining Company, in Galena camp, on which they have an option for the purchase of a controlling interest.

This company have started up their smelter and it is now running at full capacity. They are working fifteen men in the Florence tunnel, now in 800 feet, and advancing the drifts driven from it by the original owners. The company's stamp mill is running steadily, the ten stamps handling from thirty to thirty-five tons every twenty-four hours.

It is reported that a majority of the claims surrounding the development shaft now being sunk on the Snowstorm group by I. L. Merrill and associates have, during the past week, been bonded for a short time at good figures.

The Amazon Mining Company have about completed arrangements for the erection of a 20-stamp mill on their property near Custer peak. During the past season they have done a large amount of development work which has shown the property to be a valuable one.

COLORADO.

Republican: At Cripple Creek the Good Will Tunnel Company is to put on machinery at once, starting with leases and right-of-way secured in advance along its full 3000 feet, and contracts for drainage and transportation have been closed with nearly every property on the line.

The Christmas ore chute has been entered in the third level at 230 feet in a distance of 57 feet from the shaft. Ore now shows in all three of the levels and the mine is making a steady production of fifty tons a week.

Capitalists from the East will undertake to drive the deepest and longest tunnel that has yet been started in this district as a legitimate enterprise. Starting at a point on Cripple Creek a few hundred yards below the Brodie mill, the tunnel heads in the heart of the Cripple Creek gold belt in an easterly direction and stops at the Last Dollar mine on Bull hill, 12,000 feet away. In this distance it gains a depth of more than 1400 feet in cutting under the saddle between Bull and Battle, and its end will have a depth of 1238 feet below the collar of the Last Dollar shaft. A force of men has already been started to work.

J. H. Mason has secured the Blue Bird under bond and lease. The bond calls for $250,000 and the lease has six months to run.

An option has been secured by Lanahan & Sons, Wall street, New York, on the Orphan Bell properties. The option is for $350,000 and runs until December 15th of the present year.

The Victor ore chute has been cut in a crosscut run 45 feet east from the eighth level from the main working shaft, which now has a vertical depth of 440 feet. Where entered the ore is about the same body and value as in the levels above, showing the ore to be continuous for that depth.

W. S. Stratton has purchased the holdings of Kennedy & McCreery in the Gold Crater Company, and it is understood that a big consolidation of the Gold Crater and Plymouth Rock groups, and possibly other adjoining properties, is being planned. If this is the case, and the consolidation is effected, it will form the largest block of patented territory in the district and practically cover Globe and Ironclad hills.

The November output from the Anaconda will be about the same as that of last month, or in the neighborhood of $50,000.

The Anchoria-Leland output for November will be about $50,000.

In Silverton district the Zuni tunnel is being driven at the rate of 4 feet per day. It is expected to cut the vein by January 1st at the distance of 500 feet, of which 220 has been completed.

The Veta Madre is under negotiation for a sale to New York parties for $200,000.

George Crawford has placed the Jess mine, located near the Wales, with a New York syndicate for $25,000, of which $5000 has been paid the owner, William McNanamay.

Eastern men are at Fourmile looking over the Timberlake placers, and it is said that a sale of 1200 acres for $200,000 will be effected.

At Victor work has been resumed on the Climax group at the foot of Squaw mountain. The water is being pumped out and the working will be sunk for a new level.

At Ouray the Japan will soon start up with a force of 100 men, after a short period of inactivity.

In the Silver Bell at Ironton a big strike of bismuth, silver and gray copper was made about 300 feet from the old workings, and a force has been placed at work on the vein.

The Guston, at Red mountain, has ceased operations for the winter, and, perhaps, indefinitely. Two engineers and two pumpmen have been retained. Over sixty-five miners were thrown out of employment.

Plans are being prepared for two new smelters on the Austin pyritic method of making copper and iron matte, each of which will have a capacity of 100 tons per day.

In San Juan county the Last Hope Company is arranging for a tramway from the mine to the mill, and will increase the latter from twenty to sixty stamps.

The Lucy mine, the south extension of the Last Hope, in Ice Lake basin, has been sold to Eastern parties for $12,000 and will be developed during the winter.

At Idaho Springs Denver and Colorado Springs parties have associated with C. W. Tyrer in opening up the Golconda group of claims. A crosscut tunnel is being driven from the Fall river side of the mountain It will be 1000 feet in length and will cut the Golconda and other lodes at a depth of from 40 to 60 feet.

A contract for sinking the shaft to a depth of 325 feet on the Eagle mine has just been completed for the Boston people, and levels will now be driven at 150 feet and from the bottom of the shaft.

ARIZONA.

Bisbee *Orb*: Another rich strike has been made on the Alcyon vein in the White Gold Basin mine in Yuma county.

A large body of ore was recently developed in the Senator mine, in Maricopa county, and the mill again started up.

The Bonanza mine at Harqua Hala is working about thirty men and running ten stamps of the mill and taking out considerable metal.

D. B. Gillette is pushing development on his Gold Note mine near Bumble Bee, Maricopa county, and has just completed a new hoist of a large size.

The Vulture is being advertised for sale under a trust deed. It is thought that Senator Tabor has arranged for purchasing it, and that he will start it up on a large scale.

The Coconino Mining Company has purchased a small smelter and will try the experiment of smelting the copper ore from the mines on the rim of the canyon.

Kicker: H. McOla has gone to the San Juan river with a gold saving outfit to work the placers. There are bars all along the San Juan river that are rich in placer gold but it is fine and difficult to save by the ordinary processes.

Journal-Miner: It is reported that placer gold in paying quantities has been discovered near Bill Williams' fork.

Work will be commenced shortly in the erection of the mill in the Providence company's mine on Big Bug.

The Crowned King Company has ordered a large boiler for their steam hoist to take the place of the one now in use. It is also said that they will immediately commence the erection of a new 20-stamp mill at the mine.

It is reported that Judge Griffin has sold his Fortune mine on Lynx hill to the Jersey Lily Company for $30,000 cash.

Yuma *Sentinel*: The Ponce de Leon syndicate has 20 men at work doing the assessment work on the mines.

Eastern parties have secured the Pleiades group of five mines upon which they will put a mill.

The Golden Dream Company will put a mill on their White Gold and Alcyon group of mines as soon as their Noonday mill is running.

GILA COUNTY.

(Special Correspondence).—The Old Dominion Copper Mining & Smelting Company of this camp blew in another furnace on November 10th. This furnace is a 42-inch water-jacket, with a capacity of sixty tons per 24 hours. The rectangular furnace, which has been running for the last three months, has a capacity of 120 tons per 24 hours. This gives the capacity of the O. D. C. M. & S. Co.'s plant at 180 tons per day, which is a much larger capacity than has heretofore been seen in the camp. Another rectangular furnace is now on the ground of the above company, and preparation is being made to have it erected and blown in by January 1st, '97. Then the Old Dominion C. M. & S. Co. will reduce 300 tons of copper ores every 24 hours.

The United Globe Mining Company of Globe, Arizona, is erecting a "Henshoff flat-oval" furnace with a capacity of 120 tons per 24 hours, and it will be blown in about January 1st, '97. This company has also done a great deal of developing work on their Buffalo, Hussier and Dima mines and have some exceedingly nice stopes of ore in all three of the mines, but the largest body is in the Hussier mine The company is erecting a large boarding-house, reading-room and clubhouse on their grounds near their reduction plant for the benefit of their employes, in order to keep their working men from going into Globe every night, a distance of one and a half miles from the smelting grounds.

The Globe Commercial Club of this town have appointed a Committee on Mines and Mining. The committee consist of three of the best mining men in the district—W. W. Hill, M. Innes and P. Oats. The object of this committee is to gather facts and statistics of all the mines and their products in Globe mining district and Gila county, to be published as a pamphlet, giving the information which the Eastern and Western capitalists often desire of the mineral wealth which this district and county possesses.

Globe, A. T., Nov. 30th, '96.

NEW MEXICO.

Silver City *Enterprise*: At Pinos Altos the Treasure Mining Company of Denver will soon start sinking the shaft below the 300-foot level on the Atlantic vein. About fifty men are employed at the mine and mill and the property is paying handsomely. The same company will also start sinking below the 400-foot level on the Deep Down vein.

At Copper Flat five shafts have been sunk on the property, four to a depth of 150 feet and the fifth to a depth of 220 feet. This development work uncovered very encouraging ore bodies from the start, and drifts were started upon the ore bodies at depths ranging from 100 to 200 feet. Thirty men have been kept constantly employed upon development work for a year past. It is probable that the new works will blow in before February 1st, 1897.

The Southwestern Coal and Iron Company is shipping two cars of iron ore per day to El Paso and two cars per day to Pueblo from San Jose station. The iron is taken from the Iron Bottom mine, owned by the company.

At Cook's William Kief is working sixty men on the El Paso Smelter Company's claim, which he is working under lease.

LOWER CALIFORNIA

A. H. Lacy and A. R. Bryson of Los Angeles have bonded the Bareno mines in Lower California for $100,000.

"HISTORY OF CRIPPLE CREEK."

We have just issued in book form the only authentic and reliable history of Cripple Creek gold camp, the marvel of the mining world. The book contains numerous full-page illustrations (with map) of gold mines true to life. With the sole object of introducing our big 8-page 56-column illustrated weekly paper (established 1890) we will send a copy of the above interesting book free to all who send us 25c (stamps or silver), for a 3 months' (13 weeks) trial subscription to our big weekly, which contains the latest mining news and illustrations of Rocky mountain scenery. Club of 5 and 5 books, $1. Mention THE PRESS and address. *Illustrated Weekly*, Denver, Colo.

UNION PACIFIC.

Only 3 1-2 Days to Chicago-----3 1-2.
Only 4 1-2 Days to New York---4 1-2.

The Union Pacific is the only line running Pullman double Drawing-Room sleepers and Dining Cars San Francisco to Chicago daily without change. Only one change to New York; dining car service entire distance. Vestibuled composite buffet smoking and library cars between Odgen and Chicago.

The only line running upholstered Pullman Tourist sleepers San Francisco to Chicago daily without change, and personally conducted excursions to St. Paul and Chicago without change, leaving San Francisco every Friday.

Tickets and sleeping-car reservations at No. 1 Montgomery St. Steamship tickets on sale to and from all points in Europe. D. W. HITCHCOCK, General Agent, San Francisco.

GOLD MINING PROPERTIES.

Having thoroughly canvassed this section of country during the past seven months, I am enabled to furnish valuable information to capitalists desirous of bonding or purchasing meritorious mining properties in El Dorado county. Prospects, partially or wholly developed properties, or purchasable interests ready for operation but lacking capital, can be had on favorable terms. Address, A. E. HAMILTON, P. O. Box 66, Placerville, Cal.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING NOVEMBER 24, 1896.

571,993.—PUMPING MACHINE—F. H. M. Davis, Los Angeles, Cal.
571,949.—BOTTLE STOPPER—G. Koehler, S. F.
572,029.—VENCING DEVICE—G. O. Ranson, Portland, Or.
571,936.—ARM REST FOR BOOKS—A. J. Soto, Martinez, Cal.
572,038.—SEWER TRAP—J. T. Titus, S. F.
572,080.—SPEEDING DEVICE—H. G. Wilshire, Los Angeles, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Every Inventor Wants a Good Patent

Or none at all. To secure the best patents Inventors have only to address DEWEY & Co., Pioneer Patent Agents, No. 220 Market St., San Francisco.

There are many good reasons why Pacific Coast Inventors should patronize this Home Agency.

It is the ablest, largest, best, most convenient, economical and speedy for all Pacific Coast patrons.

It is the oldest on this side of the American continent, most experienced, and in every way reliable.

Conducted from 1863 by its present owners (A. T. Dewey, W. B. Ewer and Geo. H. Strong), this agency has the best knowledge of patents already issued and of the state of the arts in all lines of inventions most common on this coast.

Patents secured in the United States, Canada, Mexico, all British colonies and provinces, England and other civilized countries throughout the globe.

Caveats filed, assignments duly prepared, examinations made, and a general Patent Agency business conducted.

Established and successfully and popularly conducted for nearly thirty years, our patrons number many thousands, to whom we refer with confidence, as men of influence and reliability. Old and new inventors are cordially offered the complimentary use of our library and free advice, etc. No other agency can afford Pacific States inventors half the advantages possessed by this old, well-tried and experienced firm.

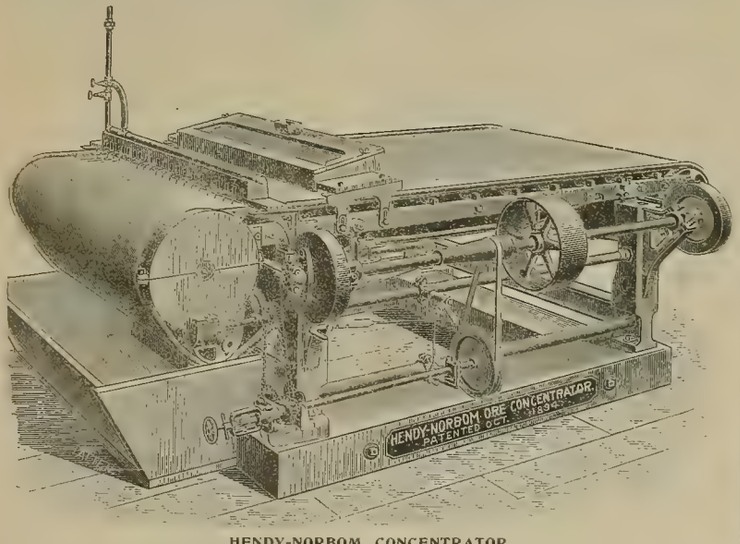
MINING AND MILLING MACHINERY.



HENDY-NORBOM CONCENTRATOR.

Office of G. McM. Ross, Superintendent Webb Gold Mining Company.
Brown's Valley, Cal., September 14, 1896.

Mr. John D. Norbom—DEAR SIR. I have been using your Concentrators at our mines in Brown's Valley and am pleased to inform you that they are in every respect thoroughly satisfactory. When erecting the plant at the above-named place we built Canvas plant, but since putting in your Concentrators we have but little use for that. The percentage of sulphurets now being handled is from 1½ to 2 per cent, mostly galena and iron pyrites, and crushed fine. We save from the pulp over your machine 98½ per cent, and it hardly pays for the labor on the Canvas plant. The motion given your Vanner by its delicately constructed curved springs renders it a perfect machine, and in my estimation it is but a short time before it will replace all other machines of a like nature now in use.

Yours very respectfully. F. W. PAGE, General Manager.

Improved Self-Contained Three or Five Stamp Mill,

Saves bill for heavy timbers, millwright and mechanics' labor, and a large amount of space. The term self-contained means a great deal for the mine owner, and can be readily recognized and appreciated in making an estimate for an ordinary plant when the comparative cost is considered.

FIRST: There is saved a large bill for heavy timbers, in many instances obtained at great expense and loss of time.

SECOND: The saving in millwright and mechanics' labor in framing and erecting.

THIRD: The large amount of space saved.

FOURTH: The great saving of freight,

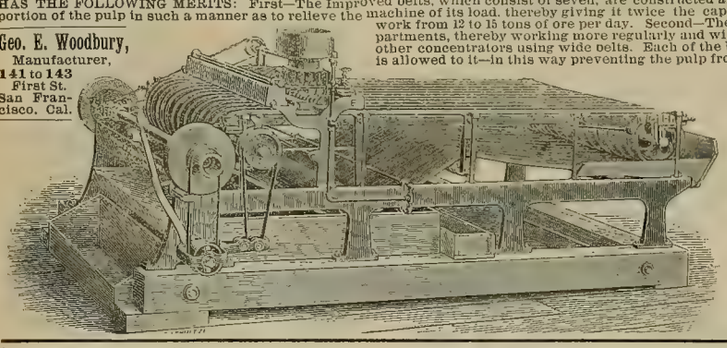
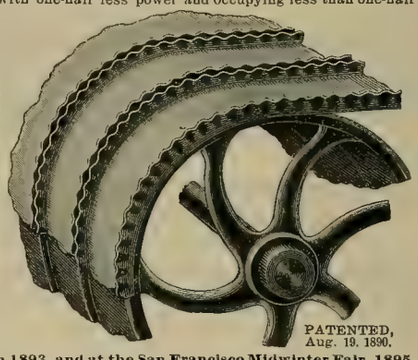
THE WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS

was awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891. MORE THAN DOUBLE THIS CAPACITY with one-half less power and occupying less than one-half the space of any other concentrator. Built of best Steel and Wrought Iron. Strong and durable. Price $575 f. o. b. Send for Catalogue and Testimonials.

The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge. THE IMPROVED MACHINE HAS THE FOLLOWING MERITS: First—The Improved belts, which consist of seven, are constructed and arranged so as to allow each belt to receive a portion of the pulp in such a manner as to relieve the machine of its load, thereby giving it twice the capacity of other concentrators, and enabling it to work from 12 to 15 tons of ore per day. Second—The machine equalizes the load by several compartments, thereby working more regularly and with much less attention than is necessary to give other concentrators using wide belts. Each of the belts on this machine takes care of the pulp that is allowed to it—in this way preventing the pulp from running to the lower side of it, as is the case when a machine becomes out of level where wide belts are used. Third—The belts run on a perfect line, needing no adjustment to prevent their running from side to side, as in other concentrators. Fourth—The belt surfaces are improved by indentations and corrugations, causing the Concentrator to save fine sulphurets and quicksilver, and perform close work. Fifth—The belts have fluted or corrugated edges, to form an expanded top edge, which effectually prevents from cracking. Sixth—The feed arrangement is perfect. Seventh—The machine is constructed of iron, with steel crank-shaft self-oiling boxes, and everything made in the most thorough manner, enabling it to run with very little attention or wear.

Geo. E. Woodbury,
Manufacturer,
141 to 143
First St.
San Francisco. Cal.





PATENTED, Aug. 19, 1890.

This Concentrator took the 1st prize at the San Francisco Mechanics' Institute in 1890, 1891 and 1892, and at the California State Fair in 1892; it took the 1st prize at the World's Columbian Exposition 1893, and at the San Francisco Midwinter Fair, 1895.

VULCAN ROPEWAY

—WITH—

AUTOMATIC ORE LOADER AND AUTOMATIC DUMPING DEVICE.

For Conveying Ore, Cordwood, Etc.

EMPIRE, NEVADA, April 17, 1896.

Vulcan Iron Works.—GENTLEMEN: The Ropeway furnished by your company to convey tailings from Morgan Mill to Mexican Mill, a distance of seven-eighths of a mile, is giving entire satisfaction. We transport 200 tons of tailings in ten hours; one man does the whole business, including elevating tailings from hopper in the ground, operating Vulcan self-loader, and attending to the Ropeway generally. The self dumper requires no attention whatever. The Vulcan loader I consider the best feature in the whole Ropeway, making it possible for one man to load 200 tons in ten hours.

Yours very truly, J. P. WOODBURY, Supt.

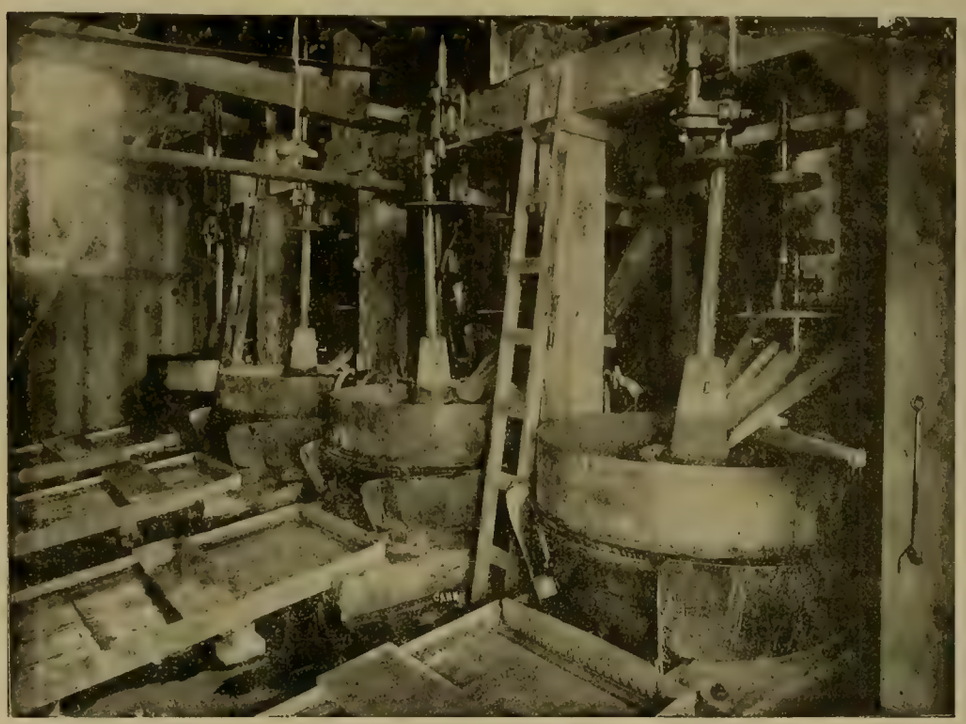
HORSE POWER.

The Cheapest Power Known; Invaluable Where Fuel Is Scarce.

The most economical motive power ever invented, costing but 10 cents per H. P. per ten hours' run, using crude oil. Cheap, safe, reliable and clean. Strong and simple to operate. Requires no engineer, and when you stop, all expenses cease, and no fire is left to endanger your building. Send for Illustrated Catalogue with full particulars, and mention the MINING AND SCIENTIFIC PRESS.



The KINKEAD QUARTZ MILL.

The Kinkead Quartz Mill will do the work of five stamps with less than half the power, and can be built and put into operation for less than half the cost of stamps. The only wear is the shoe and die, which is less than that of one stamp. The cheapness in first cost and operation of this Mill makes it possible to work with profit ores so low in value that they have heretofore been treated as waste. Each Mill will crush 10 tons in 24 hours through a 40-mesh screen.

It requires only a 2-horse power Daniel Best Crude Oil Engine to operate this Mill and one concentrator. Engine and Mill can be set up and running in 48 hours.

Price of Mill $1,000, f. o. b. San Francisco, including Self-Feeder, Ore Hopper, Frame and Foundation Timbers all framed, and one Silver Copper Plate. Weight, 2½ tons; heaviest piece, 1350 pounds.

One ordinary mortar for a 5-stamp battery will weigh more than our whole mill. This Mill can be made in 300-lb. sections, if desired, at extra cost. Send for Catalogue.

Interior of Four Kinkead Quartz Mill Plant at Virginia City, Nevada. Equal to Twenty Stamps, Crushing Fifty Tons Quartz Daily Average.

Market Reports.

The Markets.

SAN FRANCISCO, Dec. 3, 1896.

Jobbers report an increase in trade. Large arrivals of interior merchants have been the feature of the week, whose purchases have been on a more liberal scale. Manufacturers, as a rule, report running on fuller time. It is reported that considerable structural material is being taken for up-north to replace some of that destroyed by the floods. The market for metals is fairly steady at the recent advance.

The local money market is essentially unchanged. There is a continued depositing of hoarded money in both commercial and savings banks, which admits of better accommodations to borrowers. It is the general belief that after the turn of the year the rates of interest will be shaded on the better class of security. Remittances of money to the East are fair, which causes Eastern exchange to rule strong. Eastern advices report that money is coming out for investment. This favorable feature is reflected in increasing deposits in Eastern commercial and savings banks. Our New York advices report that market as follows: Time loans are still in small request. Business is mostly at 3½@4 per cent for all dates. Commercial paper is quoted at 4¼@4¾ per cent for sixty to ninety-day endorsed bills receivable; 4¾@5¼ per cent for first-class and 5¼@6¼ for good single names. There is a fair supply of paper in the market. Most of the really choice paper recently offered about by brokers has been absorbed, and notes of that kind are now in active request among the banks. The result is now seen in a freer movement of paper that may be called of a secondary grade. This is mostly the notes of interior manufacturers.

New York Silver Prices.

NEW YORK, Dec. 3.—Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.
Friday	29 15-16	65⅛
Saturday	29 15-16	65⅛
Monday	29⅞	65
Tuesday	29⅞	65
Wednesday	29⅞	65
Thursday	29⅞	65¼

	Copper.	Lead.	Iron.	Tin.
Friday	11 35	3 00	11 00@13 00	13 07½
Saturday	11 35	3 02½	11 00@13 00	13 05
Monday	11 35	3 05	11 00@13 00	13 00
Tuesday	11 35	3 05	11 00@13 00	13 00
Wednesday	11 30	3 05	11 00@13 00	12 90

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	7@8
Commercial Loans, prime	6@8
Call Loans, gilt edged	6@7
Call Loans, mixed securities	7@8
Mortgages, prime, taxes paid by lender	6@8
New York Sight Draft	10c Prem
New York Telegraphic Transfer	12½c Prem
London Bankers' 60 days	$4.84
London Merchants	$4.83½
London Sight Bankers	$4.87½
Refined Silver, per oz., 1000 fine	65
Mexican Dollars	51@52

SILVER.—The market has ruled fairly steady the past week. The steamer City of Peking for the Orient took out $336,650 in bullion. This is quite an increase on average shipments made the past three months, and goes to show that the export demand is setting in. Eastern advices state that there is a continued fairly free shipping movement, sufficient at any rate to take receipts and also over 2,000,000 ounces thrown on the market by parties who have held in expectation of higher prices. It is said that some more will come out before the close of the year, which may tend to keep prices from advancing for a short time. Our New York advices to November 28th report that market as follows: The London market for silver is firm in sympathy with the steadiness of India exchange and on the possibility of buying of silver by the British Indian Government for the purpose of coining rupees to meet the demand for money in that country.

MEXICAN DOLLARS.—The last steamer for the Orient took out 1,484,132 dollars. This is the largest shipment at any one time this year. Dealers report that the demand from importers is increasing. The market is steady.

QUICKSILVER.—For the season there is a fair home and shipping demand.

The market is quoted as follows:

Domestic trade, per flask	36 50

For export, quotations are nominal but less than for home.

COPPER.—The market is fairly steady. Eastern advices indicate some shading in prices, but in view of the large consumption abroad and increasing demand from home consumers it would seem that any weakening would be of a temporary character. New York mail advices just to hand reports as follows: The most interesting feature in connection with the market was a report that the English Government has recently purchased 1000 tons of ingot, and that 2000 tons have been taken for shipment from Europe to this side of the Atlantic. The latter movement is somewhat mysterious, but probably not wholly free from late speculations.

Ingot, jobbing	14½@—
Ingot, wholesale	13½@—
Sheet copper	17 @—

LEAD.—The market has held steady. An improved demand is looked for after the turn of the year. Eastern markets are steady to firm with supplies moderate only.

Our market is quoted as follows:

Pig	—	@	3 75
Bar	—	@	4 00
Sheet	—	@	5 25
Pipe	—	@	4 50

SHOT.—There is a good demand for all sizes.

Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs			$1 20
Drop, B and larger sizes,	"	"	1 45
Buck, Balls and Chilled, do,	"	"	1 45

ANTIMONY.—Our market is quoted at 7½@8c in a jobbing way. New York mail advices quote 7¼@7½c for Cookson's, 6¾@6¾c for Hallett's and 6¾c for Japanese, from store.

BORAX.—The market is barely steady. There is a continued free movement eastward.

The market is quoted as follows:

Refined, in car lots	5
Refined, in sacks	4¾
Powdered, in car lots	4½
Concentrated, "	5

TIN.—Pig is a shade easier, but plates are steady to firm. Eastern advices state that American manufacturers have sold well up to June and July.

Pig, per lb	14¼c@	—
Plate, I C coke, heavy, per box	— @	$4 05
" " " light, "	— @	3 95

IRON.—There can be no doubt but the consumption of pig on this coast in 1897 will show a decided increase over that of the year just drawing to a close. At the East the feeling does not appear to be quite so bullish, owing to the belief gaining ground that furnacemen and others are going ahead too fast. Referring to the situation the *Iron Age* says: "An undercurrent of disappointment is noticeable in nearly all reports. Possibly it is simply a reaction after the hopeful anticipations of the early part of the month. Some think that it is the result of natural antagonism among buyers against combinations. The Wire Nail Association will go into history as the most noted example of an effort to set the laws of trade at defiance, and the iron trade generally will welcome a return to normal conditions in this industry, because it means untrammeled consumption."

AMERICAN.

	To Arrive.	Spot.

Cut, carloads, " "			....
" jobbing, " "			2 50

Mining Share Market.

SAN FRANCISCO, Dec. 3, 1896.

The market advanced slightly the forepart of the week under review in sympathy with Chollar, Potosi and Savage which sold respectively up to $2.35, $1.10 and 68 cents. The advance brought in sellers, which was taken advantage of by the bears to force a decline of nearly 25 per cent in the leaders. The lower prices caused some buying for a turn which steadied prices, but only for two sessions when, under another selling pressure, both Chollar and Con. Virginia sold down to $1.50 and the rest of the list proportionately. The advance was due to the Chollar management starting crossdrifts on the 400-foot level to run for the ore found above while the decline is said to have been brought about by free selling by one or more large holders which was soon discovered by others, who also commenced to sell. Reports are current that in both Chollar and Hale & Norcross the 400-foot level does not come up to expectation. It is a matter of record that the Hale & Norcross management has become convinced that so far as their grounds are concerned the work has proved a failure, no ore worth speaking of having been found; acting on this the company has notified the Brunswick lode mining companies that it will withdraw from the working compact. This information has caused many operators to discredit the entire lode who either sold short or else their holdings. While this is the situation at present dealers ought not to become too frightened for the work in Gould & Curry and Best & Belcher is said to be quite promising, and a body of ore may yet be struck. The official letters received from the superintendents the past week are not calculated to enthuse shareholders, but, on the contrary cause an uneasy feeling. Perhaps this is what is desired so as to get outsiders to sell by which shares of the more favored mines can be better concentrated for future operations. There can be no doubt that the decline in the market has caused considerable selling by outsiders. Who has bought is a debatable question, but from an outside standpoint it seems as if strong parties have done so. Even if moneyed men are in the market it is no reason why others should come in for the former can send prices as they have before, very low and keep them down while collecting assessments.

The shares of the Bodie mines begin to show strength.

From the Comstock mines the news, taken as a whole, is unimportant so far as immediate results are concerned. Both private and public advices point to more time being required before striking ore, but this condition is not different from what has obtained for several years past. In Alta they are still working on the 725-foot level. A little ore is saved each week. From Overman nothing new has come to hand. An assessment has been levied, which may help in making public any ore found. Seg. Belcher and Belcher continue to raise ore, but from what level official letters are silent. This silence causes the better class of operators to believe that the work being done is of quite an important character. Work has not been resumed in Crown Point. News from Yellow Jacket is hard to get. In Confidence a few tons of ore are raised each week. No work is reported in Challenge. The Confidence-Challenge-Con. Imperial west crossdrift is being driven slowly ahead. In Con. Imperial west crossdrift No. 3 is still being driven ahead. In Alpha they ran into favorable stringers while extending west crossdrift on the 500-foot level. In Bullion no change is reported in the work. The work on the upper levels in Potosi may result in considerable ore being found, but at present only bunches of fair grade are reported. Work was suspended in Chollar on November 26 so as to work up all the ore on hand in the chutes and dumps at the mill. The stoppage of work also helps to get the prices of shares down. In Hale & Norcross they are still working on the 900-foot and 1100-foot levels. On the latter level stringers of quartz have been cut in extending the east crossdrift. Work is continued in the Gould & Curry and Best & Belcher joint east crossdrift from the Bonner shaft. In Con. Virginia they are still working on the 1000-foot, 1650-foot and 1750-foot levels. Our advices, as also public advices, do not report any material change in the material encountered in prosecuting the work. The official letter from Ophir continues to report progress and low-grade ore on the Central Tunnel level, and also 1000-foot level. They seem to know how to kill time as well as tire out shareholders. But in this respect the company does not appear to be much, if any, different from several of the others. In Mexican they report passing through porphyry and clay seams in prosecuting work on the 1000-foot level. Advices from Union, Sierra Nevada, Utah and Andes do not report any change worth noting.

From the Brunswick lode private advices are discouraging. It is stated with a positiveness which does not admit of denial that not only the work in Hale & Norcross is a failure, but that in Chollar is also. The action of the shares would seem to confirm these unfavorable assertions. Official letters do not report extracting of ore on the 300-foot Chollar level, but they report fair progress in the different crossdrifts on the 400-foot level. In Occidental the work is not essentially different from that reported last week. The official letter from Hale & Norcross reports work on the 400-foot level, without, as yet, anything being found aside from two or three stringers. The work in Savage, Gould & Curry and Best & Belcher is said to be of quite an important character. Some mining men go so far as to say that if a body of ore is found on the Brunswick it will be in one of these. This opinion is stated to be on the favorable character of the ground in the different levels on which work is being done.

The following illustrates the changes of the week:

Assessment Notices.

OCCIDENTAL CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Silver Star mining district, Storey county, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 24th day of November, 1896, an assessment (No. 25) of fifteen (15) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 29th day of December, 1896, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 18th day of January, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office—Room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

JAMISON MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, on Jamison Creek, near Johnsville, Plumas County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 27th day of November, 1896, an assessment (No. 9) of five cents (5c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 120 Sutter street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of January, 1897, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 22nd day of March, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

SAM W. CHEYNEY, Secretary.

Office—Room 50, 120 Sutter street, San Francisco, California.

DELINQUENT SALE NOTICE.

GREENWOOD GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Greenwood, El Dorado county, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 1) levied on the Sixteenth (16th) day of October, 1896, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
Adams, Grove	7	11,000	220 00

And in accordance with law, and an order from the Board of Directors, made on the 16th day of October, 1896, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, Room 79, Nevada Block, 309 Montgomery St., San Francisco, California, on MONDAY, the 14th day of December, 1896, at the hour of 1 o'clock P. M. of said day, to pay said Delinquent Assessment thereon, together with costs of advertising and expenses of sale.

WANTED,

A position as Superintendent or Assistant Superintendent in copper-silver or silver-lead smelting works.

Understands mining, sampling, assaying, furnace management, handling men.

Prefer Mexico or Spanish South America. Speaks Spanish. Best references.

Address, METALLURGIST, this office.

WANTED.—A position by competent and experienced Mining Engineer and Metallurgical Chemist. Thoroughly understands mining, mining machinery, assaying, ore treatment (including cyanide, chlorine and bromine) and handling men. Can take the tools from any miner's, mechanic's or machinist's hands and do his work. Can survey, draft, and keep books. Also understands electricity. Best of references. Will go anywhere Address M. E. and C. E., care Mining and Scientific Press, San Francisco, Cal.

WANTED.

A 1 large Gold or Copper Property, located anywhere from Alaska to Mexico. Must have ore body developed 200 to 300 feet deep, with a large amount of payable ore actually in sight. Or a property with a large body of payable ore exposed sufficient to warant extensive development work. No small property wanted. Send complete description to M. KUHN, 12 Front St., San Francisco.

WANTED.—A1 Mine Superintendent. State references and salary expected. Address Box 37, this office.

ASSAYER, MILLMAN AND AMALGAMATOR desires position at Mill. Has had years of practical experience. Good references. Address "Assayer and Millman," care this office.

Assaying Gold

.....AND.....

Silver Ores.

By C. H. AARON.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores.") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

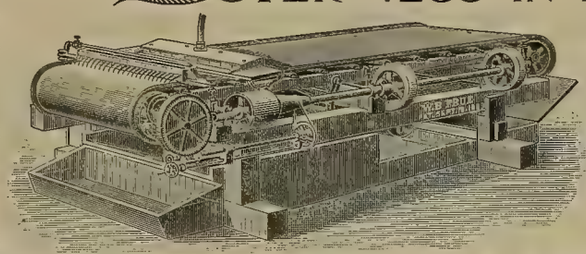
Table of Contents:—Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 126 12-mo pages, with illustrations, well bound in cloth; 1896. Price $1.00 postpaid. Sold by the **Mining and Scientific Press**, 220 Market St., San Francisco.

FRUE ORE CONCENTRATOR.

OVER 4200 IN ACTUAL USE.

Manufactured under Patents of
April 27, 1880;
September 18, 1883;
July 24, 1888;
March 31, 1891.
July 18, 1893.



It can be safely stated, without going into a description of several new and untried concentrators that have lately come into the market, that where sulphurets are of such value as to make close saving necessary, the Frue Vanner is always used. It is the only endless belt concentrator in the market that can be relied on to handle all classes of ores, and give universal satisfaction. (In all competition of concentrators the Frue Vanner is taken as the standard machine of the world and all comparisons made by it. There have been over 4200 of these machines sold, 1700 having been sold on the Pacific coast alone.) They are in use in every part of the world where mining is carried on and in all cases they are giving perfect satisfaction. From time to time valuable and important improvements have been made in this machine to increase its capacity and durability, and particular attention is called to the Patent Lip Flange for the rubber belt, which does away with nearly all the strain and cracking, as in the old style of flange, making the life of belt more than double that of other style belts in the market. The lip of flange bends outward in going over the large end rolls, thereby distributing the strain in the solid rubber, and bringing virtually no strain either at the edge or at the base of flange, as is the case in all belts with a raised edge.

For any information, pamphlets, circulars or testimonials, call on or address

The Mining Bureau's Publications.

The annual report of the State Mineralogist will be published some time this month. In his report to the Board of Trustees Mr. Crawford recommended that the data relating to important mining counties, besides being printed in the usual report, be afterwards segregated and published in pamphlet form, some 1000 copies to be supplied to the supervisors of the respective counties for distribution. This was a valuable suggestion, and was made in pursuance of requests from representatives of several of the counties. It had been pointed out that in response to requests from non-residents for information as to any county one of these pamphlets could be sent. To send the whole report would not in all cases serve the purposes desired, for in some cases the recipient's attention would be directed to other counties, and the very object desired—namely, awakening an interest in the county—defeated. Another point worth considering would be the saving of postage.

Mr. Crawford accordingly made a requisition upon the State Printer for such separate reports for fifteen or twenty counties, but this was not allowed, for the reason that there was not enough type in the State's printing office to let the whole report stand in type until the county pamphlets could be printed from it. It was also suggested that the general report be stereotyped and the county reports made up from that. This was not allowed on the ground of expense.

However, Mr. Crawford, then, in pursuance of a promise made to Assemblyman Reid of Trinity county, and in the nature of an experiment, made a requisition for the publication in a separate pamphlet of the data relating to Trinity county, to be distributed by the supervisors of that county. This requisition was allowed. The result of this experiment will be looked forward to with interest.

The extra expense involved in these separate publications cannot be large, and it is to be hoped that some arrangement in the future may be made by which each county that desires it may have its separate pamphlet. It has been suggested that some of these counties would be more than willing to share in the expense. This would be only fair, for while some counties would require large numbers of pamphlets others would obtain no advantage from them.

Before the next report is published it is to be hoped that some arrangement will be made for stereotyping the forms not only of the report but also of the bulletins issued. It is very difficult to estimate in advance how many copies of any publication will be required. The numbers printed of the twelfth annual report was exhausted within five months after publication and many thousands would have been required to supply the extra demand.

There are many reports published by the State at considerable expense that are of little value. If there is any reason at all for publishing these reports, for which there is such a large demand, that demand should be supplied.

THE 1250-H. P. STEP-UP TRANSFORMERS AT NIAGARA. (See page 483.)

THE STEP-DOWN TRANSFORMERS AT BUFFALO. (See page 483.)

Gold Yield of 1896.

It is claimed that the output of gold from the Baker county mines in Oregon for 1896 will exceed that of 1895 by 40 per cent. There will also be a large increase in the yield of the mines of southern Oregon—in fact, all along the Pacific coast from Sinaloa, Mexico, to the Yukon river in Alaska, in nearly every mining district the gold yield this year will show a considerable increase over that of last year. The same may be said of Nevada, Utah, Colorado, South Dakota, and the rest of the region lying west of the Rockies. As a consequence, if there is any substantial increase in the world's output of gold over that of last year, it is probable that more of it will come from the western part of North America than anywhere else. It is safe to say that this increase will exceed ten millions of dollars.

The African yield will hardly exceed that of last year, and the Australian output may fall short. In Russia and South America there will probably be some increase.

That the output will be still further increased on the Pacific coast for several years to come there can be little doubt. The large amount of development work done and being done on proved properties in California and the new discoveries of other districts give guarantee of that.

THE gold yield of California in 1895 was $15,334,317. Most conservative estimates place the yield of 1896 at from sixteen and a half to seventeen millions. With the big mines now developed, and upon which mills are being erected, there can be no question that there will be a greater increase in 1897.

The Argonaut and Secretaryship of Mines.

In a late issue of the San Francisco *Argonaut* appeared an editorial in which it said :

The movement started in favor of a "Department of Mining" and a new Cabinet official whose title should be "Secretary of Mines," we consider highly absurd. The Government of this country is for the whole country, and not for a few of the States. The year the last census was taken—1890—the director of the mint gave the output of the gold and silver mines at $97,735,730. Eighty-eight millions of this came from California, Colorado, Montana, Utah and Nevada—five States. The census gives the value of manufactured products for 1890 at nine billions of dollars! There is no "Department of Manufactures," yet from the foregoing figures it would seem to be much more needed than one of mines. Further, if all the States containing mines other than those of gold or silver were added to the list of five States given above, it would not make one-third of the roll of commonwealths in our Federal Union. The Government of this country is for the people, and all the people, and not for the mine owners alone. We may further remark that we think this is an excellent time for the mine owners to stop "demanding" things.

The *Argonaut* has long had a reputation for being rather certain of its facts whatever might be said of its conclusions. But in this case the facts are carefully avoided.

If all the States containing mines other than gold and silver were added to the list it would make a roll of all the States and Territories. There are several States in the Union in which the mineral product is far more valuable than that from any of the gold and silver States.

The mineral product of the United States is valued at over $600,000,000 and is increasing faster than any other product. The comparison of this with the value of the annual manufactured products is not fair. From this value of manufactured products should be taken the value of the mineral products, the value of the agricultural products and of the imported raw material used in manufacturing in order to get at the amount of wealth added annually by the manufacturers. It is doubtful if it would exceed the value of the mineral product which is all—every cent of it—so much added to the wealth of the country.

The mining industry does not need nor ask any assistance from the Federal Government that will entail any expense worth mentioning. All that is asked is that the Government place the industry in a position to obtain the same benefits from its laws and machinery as others. There is in the minerals of this country a source of great wealth, that has long done much for the material prosperity of the United States. It should be conserved, and a little intelligent discretion on the part of the Government will save many millions that would otherwise be irretrievably lost.

As to "demanding" things, it seems hardly fair for as stanch an advocate of high protective duties for the manufacturing interests as the *Argonaut* to speak of that.

The Mineral Land Bill.

The Mineral Lands Committee of the California Miners' Association will meet in this city to-day, to take steps toward securing the passage at the present session of Congress of the Mineral Land bill. It is of great importance that the bill be brought up and acted upon as early in the session as possible. If it is allowed to stay in committee toward near the end and get into the rush of the last days of the present Congress, its enemies will find it an easy matter to have it side-tracked, as was the case at the last session. The sooner it is brought forward the better its chances of passage.

Since the last session of Congress the railroad people have been very active in the work of securing patents for lands that are unquestionably mineral in character, and if the proposed bill is not passed at the present session, there will be little use in bringing it up again. In Trinity, Shasta and Siskiyou counties the railroad is especially active at work. The local miners' associations and the papers are doing what they can to prevent those frauds.

In a great many cases the railroad expects to carry its point and patent the lands through the failure of the locators to see the published notices. In order that they may not have this advantage, the county organizations are taking steps to see that those interested are personally notified. The Ætna, Cal., *Report* in a late issue says :

In these contests the railroad company generally depends largely for victory on default to the citations by those persons interested. Therefore it behooves those who are summoned to appear at the land office for the purpose of defending their rights, to take the necessary steps for properly presenting evidence as to the mineral character of the lands in dispute. If the decision of the land office should be adverse to the miners, it will mean the consumption of much time and money in appealing the cases to the Washington authorities for just adjudication. Therefore those who are cited to appear should leave no loophole through which the railroad company can consummate its object.

The object of the Mineral Lands bill is simply to provide that all these cases be honestly and fairly adjusted, and to take from the railroads the unfair advantages they now have.

The State Mining Laws.

The sub-committee of the California Miners' Association Committee on Legislation, having in charge the proposed mining laws to be presented to the State Legislature, has made a good beginning. The proposed laws, as published in the MINING AND SCIENTIFIC PRESS of October 31st and November 7th, with some changes suggested by members of the committee and by others interested, could well be printed in pamphlet form, copies sent to each member of the Legislature, and they be requested to consider them so as to be ready to act upon them as early in the session as possible, in order to secure their passage before the time of the Legislature is taken up with the large number of bills that naturally come in and take up the time and interest of individual members.

There can be no objection to the passage of such laws as are proposed. They are becoming more and more a necessity to the mining industry and cannot in any way injuriously affect other interests. No one can be interested in opposing them. Their passage will entail no extra expense on the State government, but should, in time, save considerable in the way of litigation.

The proposed bills have been submitted to the Governor for his consideration, and it is believed that he will make favorable mention of them in his message to the Legislature. Governor Budd has often expressed his willingness and desire to do all in his power for the good of the mining industry; and it is to be hoped that the committee will have his valuable co-operation.

Of Business Value.

Recently the leading authority in the United States on the subject made the unsolicited statement that this paper had "in all the States of the Far West and the Pacific slope, consisting of California, Oregon, Washington, Idaho, Montana, Wyoming, Colorado, New Mexico, Arizona and Utah, the largest circulation credited to any publication devoted to engineering and mining." On the same subject the same unquestioned authority said: "Among the engineering and mining papers in California, none has credit for so large a regular issue as is accorded to the MINING AND SCIENTIFIC PRESS. In fact, it fully equals five times the combined issue accorded to all others." The same authority also said: "Character advertising pays the investor best. It is not the extent of the circulation of the paper, but the class of people who read it. Class journals reach a particular set of individuals. If it is a mining and scientific publication its circulation must necessarily be among that class of readers who are engaged in mining and kindred occupations. Advertisers have begun to realize that quality and quantity are co-existent in a good medium ; and that a few who are probable buyers are better than the multitude who are not. Any sensible man knows that one gold pin is worth twenty brass ones, but it is only recently that the bulk of advertisers have come to appreciate the same idea as applied to newspaper circulation."

It is very flattering to this paper to have the leading authority on the subject in this country show that the MINING AND SCIENTIFIC PRESS excels in the quantity and quality of its circulation, thus giving the two very best reasons that could be given why advertisers should patronize its columns, and this paper appreciates the compliment for two reasons—first, because it is the simple recognition of the truth, viz., that an advertisement in this paper is seen by thousands of probable customers—and not solely by a hundred competitors; and, second, because no amount of money proffered the publication making the statements quoted herein would induce them to make such an assertion unless it was known to be the truth.

In these days of activity in the mining world such indorsement has a business value to this paper which is worthy of editorial notice.

Report of the Geological Survey.

The sixteenth annual report of the United States Geological Survey just published shows that the districts in which timely work on the part of the survey would do most good have received due consideration. Director Walcott has introduced a marked change in the policy of the survey in order to bring it more in touch with some of the economical and educational interests of the country. A very important step taken has been to make reconnoisance surveys of regions supposed to be rich in economic resources in order to obtain information which under the ordinary plan of waiting for a complete survey would be delayed for years. Of the good work done in this direction during the past year or more in the new mining districts we have spoken before.

The mining States have fared very well, considering the meager appropriations that have been made by Congress for the work of the survey. Of the amount expended for topographic work, $159,200, California and Colorado each received $20,000, South Dakota $10,000, Idaho $5000, Washington $5000 and Oregon $10,000—in all about half of the total. Of the amount spent on geologic work, nearly as large a proportion went to Western mining districts.

The appropriation made by Congress for 1894-5 was but $421,000—surely a very small sum for the purpose in such a large territory as the United States. Considering the amount spent, the Survey has done a great deal of good, and this should be a strong argument before Congress in favor of an increased appropriation. Now that it is proposed to undertake a systematic geologic survey of this State, it behooves our representatives and senators to do what they can in that direction, for good general work such as is being done by the United States Geological Survey will be of the greatest value to a State survey.

A NEWSPAPER is to be started soon at Randsburg, Cal.

THE trial of the cyanide patent cases in South Africa began Feb. 15, '96.

EX-SENATOR DORSEY says that work on that 100-stamp mill will soon be begun at Picacho, Cal.

PROMISING copper deposits have been discovered in the Portis district, Humboldt county, Nevada.

THE United Verde copper mine at Jerome, Arizona, produces about 80,000 pounds of copper daily.

SOUTH DAKOTA'S mining inspector estimates $7,000,000 as the aggregate gold yield of that State for '96.

A RECENT thirty days' run of the Fortuna 20-stamp mill, near Yuma, Cal., turned out $93,500 in gold.

SOME of the business men of Needles, Cal., are making a move to secure a 100-ton smelter at that point.

THE Redlands, Cal., *Citrograph*, says "we have six manganese deposits in sight, and can furnish all the manganese desired."

THERE had been shipped up to Dec. 1st, from the mines and smelters in southern Kootenay 26,717 tons valued at $2,979,347.

THE Rossland, B. C., *Miner* began the publication of a daily edition on the first of December. This is the first daily in the district.

THE new shaft at the Utica mine in Calaveras county, to be sunk 2000 feet, will be 14x5 in the clear, comprising three 4x4 compartments.

W. R. RUST, of Tacoma, Wash., says he will shortly begin the erection at Vancouver, Wash., of a new smelter of a daily 250-ton capacity.

THE Virginius mine at Ouray, Colorado, was closed down last week by a strike of the miners caused by a dispute with the shift bosses.

CAPTAIN A. H. WARD of the Mariposa Electric Company has returned from the East and says that his company will soon go on with its work.

COLORADO'S gold output last year exceeded that of silver. This year it is thought the difference will be even greater in favor of the former.

THE Needles *Miner* claims that the Cedar Valley Mining Company are saving 95 per cent of the gold and 85 per cent of the silver of their ores.

A NEW stage road from Mojave to the Randsburg mines, thirty-five miles in length, has been opened. The old road was fifty-four miles long.

THE total yield of the Comstock from 1859 up to 1891 was $338,444,658.97 from ore. Of this $197,674,079.69 was silver, and $140,771,979.28 was gold.

ARTICLES of incorporation of the London Gold Tunnel Company have been filed in Shasta Co. It is to work the London gravel mine in the Centerville district.

IT is reported that the Government has granted the G. V. & N. road a right of way across San Carlos Reservation and that a line will soon be run into Globe.

THE Eclipse, or Luxe mine, seventy miles from Phœnix, in the Bradshaw mountains, Arizona, is the only exclusively silver mine now being operated in that Territory.

SAN DIEGO announces that a representative of the Exploration Company is examining the La Paz, Encarnation and Espiritu Santo copper mines in Chihuahua, Mexico.

EACH U. S. mail trip from Juneau to Circle City, Alaska, costs the Government $500: six trips are annually made. On the first trip 1474 letters were carried to Circle City.

A CHICAGO company is erecting a mill near the petrified forest at Holbrook, Arizona, to crush the stone to be shipped to Chicago and converted into a substitute for emery in grinding.

THE Pacific Company has been organized under charter from the Legislature of Virginia, with a capital of $20,000,000, to open up mineral deposits in northern Peru, principally coal.

THIRTY days is allowed after completion of the required amount of work or improvement on an unpatented mining claim in which to file affidavit thereof with the county recorder.

OF all present businesses on earth or off it gold mining is the only one in which there is no competition: that is gold mining: which is entirely distinct from disposing of mining shares.

THE delinquent assessments on mining companies represented in this city aggregated $1,543,600 in '94; $1,261,216 in '95. This year the aggregate delinquency will be about one million.

SUPT. SPEER, of the Colton, Cal., Cement Co., says if guaranteed 1000 tons of ore he will build a smelter there. Adam Thompson, Nanaimo, B. C., offers a subsidy on a similar proposition.

THE Golden Reward Mining Company, in the Black Hills, Dakota, have decided to build a matte smelter of 200 tons daily capacity, and the Union Hill Mining Company contemplate erecting a 100-stamp mill.

BRADSTREETS' reports of bank clearances for October show for Helena, $2,368,921; Seattle, $2,470,849; Tacoma, $2,657,189, and Spokane $2,864,252. Spokane and Helena are smaller towns, but they are mining centers.

THE Black Oak mines of Tuolumne county have been sold to the Franco-Belgian syndicate for over $300,000. Charles H. Meyer and Leopold Meyer, who represent the syndicate, have under consideration other properties.

A WOMAN in Siskiyou is developing one of the widest ledges in the State. She is Mrs. N. E Hilt of Coles, who is working the North Star mine, on Siskiyou mountain. The ore in a 21-foot ledge, it is claimed, runs from $7 to $22 per ton.

ONE silver shipment to Europe—that of the steamship St. Paul from New York on the 2nd inst., aggregated 600,000 ounces, besides 30,000 Mexican dollars. In the matter of silver Europe and Asia have not lost their absorbent power.

IT is estimated that there are over 400 men at work on the streams running into Kings river in Fresno county, making small wages washing gravel. Lately a hydraulic giant was shipped to the district, the first that has ever gone to that part of the State.

THE presidential election for a successor to Grover Cleveland will be held on Jan. 14th, 1897. There will be 447 votes cast by the electors at their several State capitals, of which Wm. McKinley of Ohio will probably receive 272 and W. J. Bryan of Nebraska 175. The result of the January election will be officially announced by Vice-President Stevenson in the presence of both houses of Congress four weeks after the meeting of the forty-five electoral gatherings.

THE Santa Fe Railroad has organized an industrial bureau to encourage industrial enterprises near its routes. If the Southern Pacific would do a little in this direction it would accomplish something toward making itself less unpopular and increase its business.

THE copper mines about Butte, Montana, have been for some time past worked to their fullest capacity, and the output has been large: but, with the opening up of new mines, it is claimed that next year's yield will be considerably larger than that of 1896.

SUIT has been brought by Alvinza Hayward and others, owners of the Rawhide No. 2, against the Rawhide Gold Mining Co. for damages in $200,000. The plaintiffs claim that ore to that value has been extracted by the defendant company from the Rawhide No. 2.

THE recent ruling of the General Land Office as to what may be located as placers is causing trouble in Colorado, and the papers there are waking to the necessity of the passage of a bill, such as was proposed by the MINING AND SCIENTIFIC PRESS, to remedy the evil.

AT the Eureka Hill mine, at Tintic, Utah, it is reported that there is in the bullion vault of the mill over 63,000 pounds of bullion, nearly 40,000 pounds of the total being copper and the balance silver. At the present market price the value of the silver in the bullion is computed at $239,300.

THE November output of Cripple Creek was the largest in the history of the camp. This speaks well for the district, considering that some of the largest mines have not produced their usual amounts. It is still claimed that the year's output will very nearly if not quite reach $10,000,000.

WHILE the great discoveries of British Columbia have been overshadowing, there has been a great deal of activity in mining on this side of the line in Washington and Idaho during the past year. The development work alone gives promise of a large increase of yield during the coming year.

LETTERS from New York received in Deadwood, South Dakota, assert the sale of the properties under the Homestake management for $35,000,000. The sale, according to these letters, includes all the mines and mills in Lead, Terraville and Central. The Homestake has paid over $6,000,000 in dividends.

IN West Kootenay, B. C., in 1895, over 3000 claims were registered, and the output amounted to about $2,100,000, while for the first six months of 1896 it amounted to $2,200,000. The Director of the Canadian Geological Survey predicts that the mineral wealth of Canada to be developed will not fall short of that of the United States.

ALASKA has no bank. Alaska merchants keep their main deposits in this city, and issue personal checks upon those deposits. Such checks are generally accepted all along the coast as the equivalent of drafts. If a Juneau merchant has to pay a bill in New York he buys an Alaska-Treadmell mine check, which is good almost the world over.

A NEW MEXICO miner writes renewing his subscription that he takes the paper "mostly to read the advertisements in it every week." He probably has no intention to be sarcastic, but doubtless partly voices the sentiments of a good many others who take the paper for all the valuable information weekly found therein, including the advertisements.

ALMOST as many new mining papers have been started in '96 as were begun in '95, illustrating the great activity in the mining industry. Some of them are doing good work, others show a tendency to be influenced in a way that is fatal to the life of a mining journal whose existence is measured by its earned reputation and the confidence of the mining public.

THE Victoria *Times* says that 731 West Australian mines with an aggregate capital of $380,000,000, and with an aggregated ividend of $1,105,000 to their credit are listed in London. On the other hand, two Trail Creek mines with a capital aggregating $3,000,000 have paid $412,000 in dividends, yet Trail Creek stocks are totally unknown to the same stock exchange.

THE director of the North Gippsland, Australia, School of Mines states that "taking the returns of North Gippsland, we find the number of ounces extracted from 46,850 tons of quartz was 46,057 ounces. From an exhaustive examination of tailings I can safely say the loss has been over 8 dwts. per ton, or a total of 18,740 ounces, the value of which would be about £75,000—an enormous amount to be leaking away annually."

THE British Columbia *Mining Record* has editorially discovered that it has incurred the displeasure of those whose mining plans it has criticised. Our contemporary will also discover that it will likewise incur the displeasure of those whose fraudulent mining plans it refuses to favor or continues to expose. Such displeasure will, however, be the *Record's* best claim to the support and favor of legitimate mining enterprises.

A TELEGRAM from Casper, Wyoming, states that the Cudahys of Chicago have bought 300,000 acres of land in the Wyoming oil region and the refinery at Casper and will begin an active opposition to the Standard Oil Company. Some time ago these lands were secured by a Pennsylvania syndicate, and several wells were drilled and the Casper refinery erected. The finished product was, however, never put on the market, the company alleging that the railroads discriminated against them in freight rates.

AN attractive scheme for robbing the unwary has lately been worked in Chicago as a mining investment. A western gold mining company wanted $40,000 to develop its plant. To obtain this it issued stock for $200,000 on which a dividend of 8 per cent was guaranteed for ten years. The guarantee was made through a Chicago bank, the stock being sold at par. The bank withheld 80 per cent of the amount received for the stock or in all $160,000, remitting to its client, the mining company, the $40,000 required to develop the mine.

IN early days there were few livelier mining districts in northern California than "over on the Salmon" in Siskiyou county, with Sawyer's Bar as a center. In time the bars were worked out and the district became little more than a memory. But for one large mine worked in the seventies by an English company—the Black Bear—there would have been very little output of gold. However, in time the larger deposits of gravel began to be opened and in 1893 there was enough business to induce the building of a wagon road over the mountains from Scott Valley, thirty-five miles away. Now a telephone line has been built, and it is proposed to continue the wagon road down the Salmon toward Humboldt. Yet over on the Salmon there is almost absolutely no industry except mining, and ten years ago the old settlers said that mining was played out. It will not be surprising to hear of an electric railroad being projected from Siskiyou to Humboldt bay in the near future, for there is no part of the State where water power for generating electricity may be found in more abundance. A similar story may be told of many another mountain district in California.

DIRECTOR OF THE MINT PRESTON in his annual report says there is no doubt that the silver coins of the United States are now being counterfeited exactly similar to the genuine, size, weight and devices. Some of these coins cannot be distinguished from the genuine, even by experts. One counterfeit silver half dollar has made its appearance in the East and West, the weight of which is 192 grains, with a fineness of 867¼, while the weight of the genuine is 192.9, of the fineness of 900. The profit to the counterfeiter is now nearly 100 per cent.

AN incorporation has been formed in Salt Lake with a capital of $50,000, divided into 500 certificates of a par value of $100 each, and it is the aim and intention of the company to secure a list of 500 members, each of whom will hold one certificate of stock, and no member will be allowed to own or hold more than one certificate. The fund accumulated by the sale of these 500 certificates will be used only in the purchase of mining properties, for the development of which each member of the association will be assessed $2 a month. Such associations might well be formed by business men and miners in the camps along the mother lode for the purpose of investing in and developing mines at home.

NOT alone on this coast has the cost of mining ore been reduced. In other localities the handling of ore has been so systematized as to produce results that as published seem almost incredible; yet they come from so reliable a source as to deserve notice. In the Lake Superior country at the Olivet is probably the greatest of the Mesaba steam shovel mines. Figures from Duluth show the mine to have run its 810,000 tons of this year's output for about 6¼ cents a ton, exclusive of stripping, which is set down at not over 3 cents on a total ore body to be mined by the shovel. The management of the mines has determined to mine their entire ore body by steam shovels, and it is not considered necessary to make provision for any change to either milling or other underground process later. Ore will be raised out of the mine, when its levels have been sunk too far for present methods, by pneumatic elevators or stationary engines for lifting the loaded cars to the surface, or by running switchbacks or circular tracks down the mine. It is stated that some of the largest and best managed Mesaba mines operate underground by the caving process have shown cost sheets this year of not far from 40 cents per ton, including everything. These figures are vouched for by a reliable mining engineer in that region.

GEORGE H. EVANS, general manager of the Golden Feather, Limited, of Butte county, says: "We have cleaned up after a run of 130 feet of bedrock. Delayed through elevator accident four days. The rain has been excessive; claim flooded. Cleanup amounts to $575—only old workings. There is every prospect of improvement next cleanup. It is evident that the Cape Union people in their two seasons' work, and with the number of other people they leased the portions of their claim to, worked all of that claim thoroughly, but the Cape people did not lease any portions to others and only worked one season, and I am satisfied—so is Smith, the foreman—that at least 3000 or 4000 feet of good river remains above us untouched on the flume side, and, of course, some portions on the other side. It is easy to talk now, but we ought to have commenced this season where we are now, and then a different tale would have been told. I am willing to subscribe towards raising sufficient funds to put us in the river, should we not have time enough this season to take out all that is needed, so anxious am I to show the directors that the 'stuff' is in the river, and I feel more confident now than ever before. I have to alter my pipe line, and bring it down a different place next year, as we are so far up the river. I will lay it on a line about half way between where it is now and the head dam. Will also have to shift the dynamo house, and no further expense will be necessary for new plant."

A NOGALES, Arizona, subscriber asks: "It is proposed to leach carbonate copper ore with sulphuric acid and deposit the copper by electrolysis, regenerating the principal part of the acid. Experiments on a small scale have been very satisfactory. What amperage would be necessary in a generator to deposit 2000 pounds of copper from a solution of 4% to 10% 'bluestone' in twenty-four hours? What material for anodes is most satisfactory as regards price and convenience (carbon, sheet lead, platinum)? What would be the most convenient size for tanks; how many? What form and size should the anodes and cathodes be; how connected and how close together? What voltage should this generator have connected with such connections, and what horse power would it consume, theoretically?" These questions are somewhat indefinite, as, for instance, the first, as it depends altogether upon the series—that is, the times the initial amperage is used in the series. Answering the first, it is to be said that a generator of 100 amperes through a series of 320 vats or plates will, theoretically, deposit 2000 pounds of copper per twenty-four hours from a sulphate solution and nearly twice as much from a chloride solution; or 320 amperes through a series of 100, etc., which would be more convenient. The per cent of Cu or bluestone would only mean an increase or decrease of surface; with 8 per cent of Cu it would necessarily be about 10 feet. Regarding the second: if sulphate is used, and, of course, insoluble anodes are meant, lead is best, otherwise carbon. Third: With leachings from carbonates the vats should be small, that the slime deposited from aeration of such a solution could be cleaned out without disturbing too much of the series. The most convenient size would be not over 4 feet square on each end and from 5 to 8 feet length, if simple series is used, and longer, say, 15 feet, if tandem series; in simple series, 200; tandem, from 30 to 50, according to resistance of liquor, etc. Anodes 36x40, or thereabouts, or with common series each can be composed of smaller pieces; with series the center vats positive and the end vats of each series of 100 negative. With tandem, each series parallel, or multiple. Fourth: Any voltage, according to surface or resistance, but 125 is very convenient and suits the plate surface above mentioned. Fifty H. P. You are probably aware of the rule that any horse power deposits a given amount of copper, according to surface exposed, etc.

Nevada City District Geology.

The United States Geological Survey has just issued in a special folio maps and descriptions of the geology of the mines about Nevada City and Grass Valley that form one of the most valuable contributions ever made to the geology of this State. The following are extracts from the articles written by Waldemar Lindgren:

Throughout the Sierra Nevada there is one sharp geologic distinction to be drawn: it is the difference between the older rocks—the "Bedrock series," as it is usually termed—on one hand, and the "Superjacent series," or the much younger gravels, sands, clays and volcanic rocks, on the other hand. The Bedrock series consist of highly altered sedimentary rocks, crystalline schists and older igneous rocks, on which the Superjacent series lies in approximately horizontal position. The rocks of the former series have been subjected to repeated orographic disturbances, and to a great extent have been compressed, broken and crushed by these forces. The rocks which are now at the surface were once below it, probably thousands of feet; successive uplifts and constant erosion have removed the upper parts of the rock masses and exposed those once buried in the foundations of the range. Rightly to understand the geology this fact must be borne in mind, and the relation of the younger to the older series must be remembered.

Earlier History.—While it is comparatively easy to unravel the later (Neocene) history of the Sierra Nevada, the same cannot be said of the immeasurably longer periods preceding it. They included successive epochs of quiet sedimentation, when the ocean covered the place where the range now rises; several distinct epochs of intense volcanic action, when the lavas built up mountains of igneous masses; and other epochs during which mountain-building forces lifted and crushed together these sedimentary and igneous products. In these compressed and crushed masses occurred enormous abyssal intrusions of coarse-grained, granitic rocks. Animal life, on the remains of which we depend for the identification of the sedimentary formations, was unusually scant during the intervals of deposition, or most of the fossils were destroyed during the metamorphism which the rocks have undergone. Many parts of the Sierra Nevada have, indeed, the aspect of pre-Cambrian complexes—the oldest known—though, from the evidence available, it is certain that the rocks of the range in general are of much younger age.

The Nevada City and Grass Valley district is located in the upper foothills, near the line where the old igneous rocks of the foothill region give place to the wide belt of slaty, sedimentary rocks of the middle range; east of this sedimentary belt the granitic rocks of the highest parts of the range begin. High ridges of fine-grained, dark-green rocks, diabases and augite-porphyrites, form the first foothills of the Sierra Nevada in Yuba and Nevada counties; in the latter county these rocks extend to near Anthony House and Indian Springs, where they are replaced by a belt of coarser-grained granitic rocks (granodiorite, and gabbro), which terminates along a line drawn by French Corral, Rough and Ready and Wolf Creek mountain. Eastward of this line, up to Nevada City and Grass Valley, the geology is very complex; relatively narrow belts of more or less metamorphosed sedimentary rocks, standing at steep angles, alternate with large quantities of fresh or metamorphosed igneous rocks. Near Nevada City this complex is separated from the predominatingly sedimentary slates to the east by the rounded southern end of the great intrusive granodiorite mass extending more than twenty miles northward into Butte county. In the southern part of Nevada county the diabases and porphyrites of the foothills extend very far eastward, and an area of these rocks reaches northward, including Osborne hill, to the east of Grass Valley.

The region of complicated structure begins at Rough and Ready, five miles west of Grass Valley, with amphibolites and gabbros; then follows a belt, from one-fourth of a mile to 1½ miles wide, of sedimentary clay-slates and siliceous slates, which, near the North Star mine, enters the Grass Valley tract. A branch of these slates is deflected to the southeast and traverses the northeastern part of the Grass Valley tract. Between Grass Valley and the main clay-slate belt lies a body of diabase and porphyrite about three-fourths of a mile wide, the continuation of which northward, though broken for a short distance by intervening slate masses, is found west of Newtown. East of this diabase belt lies the Grass Valley area of granodiorite, five miles long, a rather narrow body of coarse-grained, granitic rock, the northerly end of which is found in the city of Grass Valley. Eastward of this comes the great porphyrite and diabase area of Osborne hill, limited again by the above-mentioned streak of sedimentary slates cutting obliquely across the Grass Valley tract.

The greatest complication is found between Nevada City, Newtown and Grass Valley. Within this area the rocks may be divided into three groups: (1) The two narrow belts of siliceous clay-slates with steep dip, one following the contact of the Nevada City granodiorite area for a long distance, the other imbedded in porphyrites one-fourth of a mile eastward. (2) The diabases and porphyrites, occupying a considerable area to the south of Nevada City and continuing down to the vicinity of the Maryland mine. These dark-green, fine-grained rocks form pointed areas running out northward; the largest, adjoining the first-mentioned slate belt, comes to a point about three miles west-northwest of Nevada City. (3) The diorite-gabbro-serpentine complex, beginning north of South Yuba river, forming a lenticular mass nine miles long and not over three miles wide, and running out in several points a short distance east of Grass Valley. The largest part of the latter area consists of a coarse-grained, lighter or darker green diorite or gabbro, or a rock intermediate between the two. In it lie several lenticular masses of serpentine, usually running out to sharp points; the road from Nevada City to Newtown crosses the two largest of these serpentine masses. Less altered pyroxenites and peridotites are found in or near the serpentine. There is excellent reason for believing that all of the rocks of this complex are of similar age and origin.

Turning now to the more interesting question of the relations of all these different rocks, it should be stated that no fossils have thus far been found in the sedimentary rocks of the district. The greater part of the latter have been referred to the Calaveras formation, which embraces the Paleozoic sedimentary rocks of the Sierra Nevada. Among the Paleozoic rocks the Carboniferous strata doubtless predominate, but the paucity of fossils has permitted identification only at relatively few points. The determination of the rocks in question as "Calaveras," therefore, rests on circumstantial evidence only, and this evidence consists partly in their lithologic similarity to beds determined farther south, near Auburn, and partly in their position in the prolongation of these strata northward. These slates of the Calaveras formation are probably the oldest rocks in the district. During a mountain-building disturbance toward the end of the Paleozoic or the beginning of the Mesozoic, these beds became folded and compressed. This earliest uplift was associated with the outbreak of igneous rocks, which, indeed, in some localities took place even during the deposition of the Carboniferous beds, but of those igneous rocks there is no positive trace in the region under discussion. It is believed that all of the igneous rocks of Grass Valley and Nevada City are post-Carboniferous, and probably none of them antedate the end of the Juratrias period.

During the last portion of the Juratrias period a large part of the Sierra Nevada was a land area; part of it, however, was submerged, and in that sea the latest sedimentary division of the Bedrock series—the Mariposa beds—was deposited. These are black, carbonaceous clays, interbedded from the thirty-eighth parallel northward with volcanic tuffs, which shows that during their formation volcanic forces had already begun to act. A narrow belt of black clay-slates, interstratified with elastic, volcanic material, beginning about 2000 feet west of the Champion mine and thence running southeasterly by Towntalk and the Merrimac and Washington mines, has been determined as belonging to the Mariposa beds. The slates are much less altered than those of the Calaveras formation, possess great similarity to the well known Colfax beds, and, while not directly connected with them, lie in their natural continuation to the northwest. Though not absolutely certain, this identification has a very great degree of probability. After the Mariposa epoch followed a time of the most intense mountain-building disturbance, accompanied by the outburst of an enormous quantity of igneous material of different character and texture. The younger sedimentary rocks were folded and compressed and welded with the older series of the same kind, while intrusive masses were injected in them far below the surface, and volcanoes with thousands of feet of lavas and ash masses were built up on the surface along what are now the foothills of the range. The diabases and the porphyrites, as well as the diorite-gabbro-serpentine series, belong to this volcanic period, the former as partly surface flows and dikes, partly deep-seated intrusive masses; the latter entirely consolidated as coarse, granular rocks far below the surface.

Finally, as the last and farthest-reaching phase of that period of igneous activity, came the intrusion of the large granodiorite masses in the then deep-seated part of the range. This took place on so gigantic a scale that the mind strives with difficulty to comprehend the mechanics of the process. Thus, the granodiorites of Nevada City and Grass Valley are the most recent rocks of the Bedrock series. Finally, after the intrusions of the granodiorite, dynamic forces, acting on the mass with different intensity and in different directions, produced fissure systems in which auriferous solutions ascended and deposited their contents. This forming of the mineral veins was the last phase of the Mesozoic revolution in the Sierra.

By no means all of the rocks of the district are now in the same condition in which they were formed. Successive dynamic forces have acted on many of them, producing deformation and schistose structure. Chemical forces have acted on them in at least three distinct ways, changing their mineral constituents until their original form is sometimes scarcely or not at all recognizable: first, as a result and concomitant of dynamic metamorphism; second, by the heat and mineralizing exhalations of the intrusive granodiorite; third, by the action of the hot auriferous solutions on the rocks adjoining the fissures through which they circulated.

The Mineral Deposits of Eastern California.

Written by HAROLD W. FAIRBANKS.

Introduction.—The portion of California lying east of the crest of the Sierra Nevadas has a mineral character which in many respects is quite unlike that of the rest of the State. Very little has been published about the ore deposits occurring here, although they are quite important economically and strikingly interesting from a mineralogical point of view. The area is bordered on the west by the Sierra Nevada mountains and is traversed in a general north and south direction by high and rugged ranges, between which lie the desert valleys.

Types of Ore Deposits.—The important ore deposits can be divided into two classes: (1) Gold, (2) silver and lead. Of the silver ores two distinct classes may be considered: (*a*) Argentiferous galena, generally in the form of chamber deposits; (*b*) silver-bearing sulphides of antimony, arsenic and copper, occurring in well-defined veins with a gangue of quartz.

As a rule, each of these classes of ores is strongly marked in its manner of occurrence, although there are important exceptions. Almost all the gold deposits contain silver in appreciable quantity, and at times the value of the two metals is nearly equal. The important silver deposits, on the contrary, contain very little gold.

Distribution and Geologic Relations of the Gold Ores. Commencing in the southern portion of the area in question the important gold districts will be briefly described.

Near Postoffice springs, in the Panamint range, gold is found in quartz veins inclosed in limestone. This rock, exposed in immense cliffs on the south side of the canyon, has been folded in a syncline with slates below and on the sides. The ore is high grade, the gold being present on the surface in the free state; but judging from the appearance of the quartz, it was originally contained in iron pyrites.

A large number of gold-bearing quartz veins are scattered through the southern portion of the Argus range. They are inclosed in a great body of granite which extends from San Bernardino county north through the Coso mountains to Owen's lake. The character of the quartz makes it seem probable that some distance below the surface most of the gold will be found contained in iron pyrites. Chalcopyrite and galena are abundant in some of the veins and carry considerable silver.

With the exception of numerous areas of volcanic rocks, the Coso mountains consist wholly of granite, the mineral deposits being confined to the latter rock. The quartz veins are characterized by the presence of free gold on the surface, while at depths varying from 250 to 400 feet the free gold has been found to be largely replaced by iron pyrites with a subordinate amount of chalcopyrite.

In the Beveredge gold district, on the eastern slope of the Inyo range at an elevation of 5000 to 8000 feet, the veins are confined to a large body of granite which has broken through the metamorphic series. Many of the veins are nearly vertical, while others are quite flat, dipping 20° or less, and being locally known as blanket veins. The mine which has been worked the longest and most steadily is known as the Keynote. A depth of 700 feet has been reached on the incline, and the ore, which was free milling on the surface, has been found with increased depth to contain a greater proportion of iron pyrites and chalcopyrite. In the American Flag mine, at the southern end of the district, gold is found associated with galena and even imbedded in it. The Chilula mine lies partly in limestone and partly in granite. The portion of the vein in granite carries gold; but upon passing into the limestone, the gold is replaced by silver ores. This seems to be a good illustration of the physical influence of the wall upon the ore. One of the largest veins of the district dips at an angle of about 20° into a precipitous granite ridge. Where it has been opened the average thickness is 4 to 7 feet, swelling in places to 20 feet.

A number of small but rich gold-bearing quartz veins are found on Fish Spring hill, a granite outlier of the Sierra Nevadas. There are two systems of veins here—the one vertical, the other nearly flat. As far as developed, the quartz of the district shows free gold with copper and iron sulphides.

A group of veins carrying gold and silver occurs in limestone at the western base of the Inyo range, southeast of Independence. The gold is associated with quartz and iron and copper pyrites, while the silver is contained in galena which occurs in bunches in different portions of the vein.

A quartz vein is found in granite in the foothills of the Inyo range north of Independence. It has a vertical position and is traceable for nearly a mile. The character of the quartz makes it apparent that the gold was originally contained in iron pyrites.

Beginning at a point east of Bishop creek a gold

belt extends northward along the western slope of the White mountain range for about ten miles. This belt is interesting because of the great variety in the character of the ore and wall rocks of the many different veins. At the southern end are a number of small veins in granite, two sets of fissures being distinguished—one vertical, the other almost flat. The gold which is free on the surface is mostly confined to the latter series of veins. One mile northward is the Polita mine in limestone. The deepest workings show a soft, decomposed ore, rich in hydrated iron oxides and containing but little quartz. Two miles farther on are some small veins in slate with the usual quartz gangue and sulphurets. Four miles north of the Polita mine there are several veins in slate. One—the Southern Bell—extends east and west across the strike of the slates. The ore is very similar in character to that of the Polita, showing much iron oxide and little quartz. Six hundred feet farther up the mountain in the same slates there are two very small but rich veins with the usual quartz gangue and iron and copper pyrites.

In the mountains west and southwest of Benton there are many gold-bearing quartz veins. As a rule, the gold is associated with pyrites and other minerals, which makes its extraction difficult. In some mines there is a notable quantity of galena and other silver ores. The country rock is granite.

A large number of gold-bearing quartz veins are found scattered along the scarp of the Sierra Nevadas near Mono lake. These are mostly in metamorphosed sedimentary rocks. The most important mine is the Golita, where there is a body of ore 50 to 70 feet wide, lying between limestone and a porphyry-like rock. Gold and silver both occur here in nearly equal proportions.

A very interesting group of gold mines is that on Mount Scowdan, south of Mill Creek canyon and near the summit of the Sierra Nevadas. This mountain rises to a height of 11,500 feet, being composed of granite except on the northwest where there are bodies of quartz porphyry and silicious metamorphic rocks. The mountain is seamed by quartz veins on three sides. Some stand vertically on its very summit, while others outcrop on the steep canyon walls, dipping in at an angle of 30° or less. While the greater number and more regular veins are in granite, there are some in the porphyry and metamorphic rocks. The ore from all the veins in the granite is quite similar. The gold is found free in the superficial workings together with a little galena. In the deepest workings of the May Lundy mine the free gold disappears and its place is taken by iron pyrites. Next to Bodie, this is the most important gold district east of the Sierra Nevadas.

Bodie has been the great center of gold mining in eastern California, more than $20,000,000 having been produced there. The gold-bearing veins are unique in many respects. Their period of formation followed the volcanic activities of Tertiary time, and in age as well as general character they differ markedly from the other important gold deposits of California. The inclosing rock is hornblende andesite, which covers an extensive area north of Mono lake and seems to belong to the same period of eruption as the andesites along the summit of the central and northern Sierras. The most important thing about the Bodie ores is, however, the fact that the veins ceased to be profitable below 700 feet. The veins are divided into two classes—an older easterly dipping one and a younger, nearly vertical or inclined at a high angle to the west, one series faulting the other. The veins of the Syndicate mine on the north are beautifully banded, with the appearance of having been formed in open fissures by successive layers from the walls inward. They became unproductive at a depth of 250 feet. The Standard mine next south shows a still larger number of veins, varying from exceedingly thin seams, which are very rich, to an extreme width of 90 feet. The latter vein has an average width of 20 feet, according to Whiting, and constitutes the most important ore body. In the Standard mine the veins became smaller and almost barren below the 500-foot level. In the Bodie and Bulwer mines on the south the ore bodies extended to a somewhat greater depth.

Argentiferous Galena.—Important deposits of argentiferous galena have been worked at Cerro Gordo, Darwin and Modock in Inyo county. The ore occurs generally in limestone in chamber form, although occasionally it assumes a vein-like character. The Modock mines on the eastern slope of the Argus range illustrate well the characteristic manner of occurrence. A great thickness of limestone forms the eastern slope of the Argus range between Darwin and Modock, and in many places it has been more or less mineralized, as shown by the bright yellow and red surface tints. The Modock mines are situated on a hill one-half mile in diameter, terminating a spur of the range. The central portion of the hill is filled with chamber deposits of galena rich in silver. These are scattered in such an irregular manner that no systematic method of development can be undertaken. Some are found by following minute stringers of ore or slightly mineralized country rock, while others are located by chance. The hill has been opened to a depth of 1150 feet, at which level the richest ore was found.

(To be Continued.)

The Storage of Water in Earthen Reservoirs.*

By SAMUEL FORTIER, M. Can. Soc. C. E.

(Condensed.)

Earth dams are composed of varying proportions of gravel, sand, silt, clay, organic matter and water. The same ingredients which constitute the cultivated fields and their underlying strata are in nearly every case the most convenient also the most suitable materials to use. A consideration, therefore, of the nature of the materials forming a reservoir embankment leads us directly to that of soils and subsoils. For this purpose the physical and mechanical properties of soils are of much importance. It is essential that we know the size and weight of the grains, the amount of air space they enclose, the percentages of air and water contained in these open spaces, and the effects produced by moisture, heat and frost, as well as the action of such forces as gravity, capillarity and evaporation. To such an extent is this true that one might say without exaggeration that the success of works of this character rests mainly upon the fact that they are designed and built in accordance with an intimate knowledge gained from a close study and carefully made tests of the physical properties of the materials.

The belief is prevalent among laymen and engineers inexperienced in this kind of work that any country road foreman who is familiar with the handling of earth is qualified to superintend the building of earthen dams. They fail to understand the difference between an embankment capable of withstanding a load and one compact and stable enough to retain water. In highways, or railroad fills, little, if any, attention is given to packing the materials. The fill when completed is nearly as porous as the soils and subsoils of which it is composed. When a cubic yard of earth is removed from the pit to the fill its bulk is increased by about 1¼ in sandy soil to 6 per cent in hard clay soil, and the subsequent shrinkage of from 5 to 15 per cent finally reduces it from 90 to 95 per cent of its original volume. But soils and subsoils in their natural state contain from 35 per cent to 60 per cent by volume open space, and the ordinary highways, or railroad fills are thus shown to be porous masses wholly unfit to impound water.

In the building of earthen dams something more is needed than the piling up of a mass of porous materials. The hydraulic engineer who desires to build a safe dam with a minimum amount of earth must attend closely to the following features:

1. The relative size of the grains.
2. The percentage by volume of open space.
3. The proportions of air and water contained in these open spaces.
4. The best mode of filling the interstices between the larger grains with the smaller grains.
5. The best mode of expelling the greater part of the air contained in the open spaces.
6. Making the embankment proof against the action of extreme drouth or excessive saturation.

An embankment formed of gravel would be stable and unaffected by the actions of frost, drought or moisture, but 45 per cent of open space in gravel would allow the water to pass through it. Sand would be more impervious but less stable and more affected by drought and excessive moisture. Soils containing a high percentage of organic matter might make an impervious embankment, but the necessary weight and compactness would be wanting. The same is true of all clays. Clayey soils are often styled heavy soils, but such soils are the most porous and are capable of absorbing large percentages of water. The tendency of clay to swell when wet, and shrink and crack when dry, renders it a treacherous material for reservoir embankments when used alone.

In building a distributing reservoir for Ogden City, Utah, the writer adopted a mode of compacting the materials somewhat similar to that in filling in trenches under water. The materials were, for the most part, fine sand, with an occasional stratum of coarse gravel, cobblerock, clay or silt. The capacity of the reservoir is 7,000,000 United States gallons, width of embankment at flowline 30.5 feet, water slopes one and one-half to one, outer slopes two to one, depth of water 20 feet.

After removing the surface soil a trench from 4 to 6 feet wide and 6 feet deep was dug along the entire center line of the proposed embankment. The base of the embankment was then formed and allowed to slope slightly towards it center. Instead of filling in the trench at once, it was allowed to remain nearly full of water, and it became the origin of a canal in the center of the entire embankment. The most impervious material was deposited on the inner half of the embankment, while the cobblerock and more porous material were deposited near the outer edge. The inner and, to some extent, the outer half of the embankment was built up in layers, moistened and packed in the usual manner. The central portion was built up by emptying the wheelers at each edge of the canal and shoveling the material into the water.

The mode of compacting reservoir embankments, almost universally followed by American engineers, is to specify that the earth shall be spread evenly over the surface in layers of from 4 to 6 inches in depth, then moistened and rolled with grooved rollers weighing from 100 to 300 pounds per inch of tread. In most instances the number of times each layer is rolled is left to the decision of the engineer, but some specify a minimum roller travel in miles for each 1000 cubic yards excavated

Opinions differ as to the amount of water to use. In gravel puddle, or what the writer has termed clay concrete, in which the percentage of clay is small, a large amount of water can be used with good results. This mixture unquestionably makes the safest embankment.

To those who persist in using chiefly clay it may be said that the addition of water to moisten the layers is of doubtful benefit. The effect of water on comparatively dry clay is to increase its bulk, and no amount of rolling will make it quite so compact as it would be if rolled to the same extent in a dry state.

In reference to compacting materials by depositing them under water, as was done on the Ogden reservoir, by means of a canal in the center, the reader will note that this method is applicable only to gravel puddle or clay concrete containing less than 25 per cent clay. A higher percentage of clay would render the embankment so soft that it could not be traversed by team, but the method is particularly well adapted to earth containing either no clay or very little.

It is from practical experience that the writer bases the following conclusions:

1. Earth deposited under water is freed from the greater part of the air confined in the open space.
2. Earth containing grains of different sizes packs better under water than in air.
3. Embankments built of dry earth, or earth moistened and packed, are more liable to be injuriously affected by capillary action than embankments, or portions of embankments, built under water.
4. Making provisions during construction for a canal holding water in the center of the embankment is a practical test, before completion, of the safety of the structure.
5. Most of the advantages of a center core are gained by this mode of construction without the disadvantages of having distinct lines of separation between an earth and a masonry wall.
6. Where water is abundant and easily applied, the middle portion of earth dams can be more cheaply compacted under water than by sprinkling and rolling.

Deep Mining on the Rand, S. A.

In an address to the shareholders of the Consolidated Gold Fields, Limited, in London, John Hays Hammond, in speaking of the future of deep-level mining on the Rand, gave the following interesting data:

The chief obstacles to deep level mining—now I am referring to depths greater than those at present contemplated by any of your companies, say, to depths of 5000 and 6000 feet vertically—are high temperature in the mines and the handling of excessive quantities of water which, sometimes under abnormal conditions, are encountered. Dr. Becker has fully considered the problem with regard to these factors, and I concur in his opinion, as do all the engineers of the Rand who have investigated the subject—namely, that the condition as regards temperature and water are exceptionally favorable upon the Rand. The history of mining upon the Comstock lodes, the famous gold and silver lodes of America, is often adduced as an argument against the practicability of deep level mining on the Rand, but I fail to see any connection between the two. The conditions of the Comstock are briefly these: The situation of the lode is in what is called by geologists a region of recent solfataric action—that is, of dying vulcanism. You might as well compare the obstacles to be encountered in sinking a shaft in the crater of Vesuvius with the Comstock as to compare the conditions of mining upon the Comstock with those upon the Rand. But even upon the Comstock, where I have seen the temperature over 120° in the levels, and where the water was fairly boiling out of the rocks, there were no insuperable obstacles to the engineer; it was not any engineering problem that compelled them to abandon working, but rather the fact that the ore bodies occurred in small pockets entirely dissimilar to those of the Rand, and, as these pinched out, naturally the mining was discontinued. That is the explanation of the cessation of mining on the Comstock, where the most adverse conditions obtained that I know of in the history of mining. Let us see now what is being done upon deep level mines in other parts of the world to-day. In Michigan ore is being profitably stoped from depths of upwards of 4500 feet vertically, and one of the companies which has had extensive experience in mining at these depths has started a shaft to intersect the reef at a depth of 5000 feet vertically, and to begin the extraction of ore below that point, although the value of the copper ore is not more than 26s. to 27s. a ton. So satisfied are they of the feasibility of deep level mining that they are undertaking sinking, prelimi-

nary to mining, from that depth, and no engineer who has investigated the subject has the slightest misgiving as to the success of that mining operation. Then at Pribran, in Bohemia, almost at your own door, you have an example of deep level mining. I had an opportunity of visiting the place a few weeks ago, and I found a very satisfactory state of affairs. They are mining at a depth of 3600 feet, and the temperature of the working is not over 76° Fahrenheit, but the temperature never rose to over 90°, even before the circulation of air was established by connecting the drives and shafts. I think you will admit that the engineering skill upon the Rand is able to cope with engineering problems solved in Michigan and Bohemia. Now we come to the question: Will deep level mining pay? I shall answer this question by pointing out to you in what respect we know that deep level mining will be conducted at economical disadvantages contrasted with mining upon the outcrop companies. First, the cost of the deep level shaft, as I have previously pointed out to you, will involve extra outlay, and, of course, heavier machinery will be necessary in depth, but we have carefully examined the question, and we find that, allowing about £1200 per claim, where the company consists of an amalgamation of something like 250 claims, we shall more than cover the extra initial expenditure involved in the deep level mining. When I tell you that from some of these claims we expect to receive at least £15,000 profit, and from many of them £25,000 to £30,000 profit, you will see that it is not a very momentous or valid objection as to deep level mining. When the reefs are once reached the exploitation commences, and the extra expense connected with mining would be due to excessive temperatures and to the handling of great bodies of water, which conditions will not exist upon the Witwatersrand to the depth at present contemplated by your companies. However, these extra expenses may be summed up by saying that more power will be required, and more power means more coal, nothing more nor less. At the present price of coal, this extra cost of power should not exceed 3d. per ton per 1000 feet of haulage, which is not a very serious matter. In the immediate vicinity of your mines there exist illimitable coal deposits, and, therefore, we think it is only reasonable to expect that by competition, which is bound to follow, and by the promised reduction of railway transportation, we shall get coal at a very much less figure than we are paying for it to-day; and we really expect that the item of coal will be less per ton of ore mined, when we shall require large quantities, than we are at present paying for it. The history of deep level mining universally shows a decided tendency in the decrease of the operating expenses. We are confident that the economic conditions of mining will improve; that labor will become cheaper, or, what is equivalent, more efficient; that the cost of supplies will be reduced; that the efficiency of mining and metallurgical methods will be increased, and we, therefore, confidently believe that we shall be able to mine at depths of from 3000 to 4000 feet at an expense not to exceed that at present obtaining upon the outcrop companies.

Centrifugal Pumps.

To the Editor:—Although received some months ago, I have not until the present time found an opportunity to examine Bulletin No. 9, issued by the California State Mining Bureau, entitled "Mine Drainage, Pumps, Etc."

In this work I find no less than five drawings of mine, reproduced from a paper published in London nine years ago, without either credit to myself or to the Institution of Mechanical Engineers in England, by whom the paper was printed.

Since that time great advances have been made in the construction of centrifugal pumps, and had the author applied to me—as he seems to have done to others—for practical information in various kinds of pumping apparatus, he could have embodied in his work something on centrifugal pumping more useful than appears.

It is well known on this coast and elsewhere that I have for fourteen years past been directly engaged in practically making and designing centrifugal pumps, and have at this time successfully operating more that 10,000 H. P. of such pumps.

I am not, however, complaining on the score of the professional ethics involved so much as of palpable misrepresentation.

On page 153 of the work referred to is a drawing marked "Richards Centrifugal Pump," thereby intimating that I am the inventor or designer of a particular type of such pumps, when the author must know, as is explained in the paper from which the drawing was taken, that it represents only an example of practice. But this is not the main point. On page 159 of the bulletin there are the following words:

"In the Richards single inlet pump the disc is perforated at 'N, Fig. 164,' *to allow the pressure on both sides to equalize to a certain extent.*"

The italics I have added.

Whether such a statement is made by design or in ignorance of the operating conditions I am not able to say, but it will be obvious to any one at all acquainted with pumps of this kind that the perforations referred to have nothing whatever to do with balancing the impeller disc; also, as is plainly explained in the text of the paper from which the drawing was taken, the pump impeller is "absolutely balanced."

Now that the subject is under discussion, I will call attention to the methods of construction for centrifugal pumps recommended by the author on pages 155 and 156 and elsewhere in his work.

The types shown are old and obsolete, and in their nature not adapted for use in mines where the head to be operated against is usually more than in other cases. The designs shown on pages 155 and 159 are not centrifugal pumps at all, but belong to a class known as impelling pumps, operating mainly by tangential energy and never adopted in good practice for heads exceeding 8 feet, and even for such cases will have an efficiency below that of pumps of the same class made here a dozen years ago.

On page 156 is shown a modification adopted and abandoned by at least two well-known firms on this coast and out of use for five years past.

I will also call attention to the mathematical formulæ introduced, and affecting only the velocity of rotation, a thing of little or no concern in centrifugal pump practice, and especially as it is set forth in connection with a pump in which the internal flow changes *as 12 to 5 while it passes through the impeller.*

I offer no criticism of the author's work in other branches of pumping machinery. His well-known ability is a sufficient warrant of its correctness and value, but his experience in centrifugal pumping, so far as I know, is confined to one small pump, made about two years ago, that has not reached a "second edition" in that time. Very respectfully,

San Francisco, Dec. 5th, 1896. J. Richards.

Glossary of Mining Terms.

(Concluded from L. W. Tatum's Compilation.)

Quarry—Any open work in rock on a plan of excavating the entire mass, as distinguished from working a seam or vein by shafts or approaches under cover.

Quartz—Silica. A constituent of granite. The free gold of California being found in quartz, the word was applied to the gangue of such lodes and so to other forms of vein matter, until it is now used vaguely to mean the ore, the float, the gangue, or that part of the gangue which indicates the pay streak. In the act of Congress it is used with the word rock (quartz or other rock) in the sense of pay rock.

Quartzite—A metamorphosed sandstone. A rock containing usually about 98 per cent silica, with a small percentage of foreign materials, principally iron.

Quartz Mining—Any hard gold or silver ore as distinguished from gravel or earth.

Quicksilver—Mercury, used in sluices to catch gold, also in pans and on copper plates to catch free gold and silver in milling.

Quick—(Adjective) Soft, running ground; an ore or pay streak is said to be quickening when the associated minerals indicate richer mineral ahead; also an abbreviation for quicksilver.

Rafter Timbering—That form of mine timbering in which the timbers appear like roof rafters.

Raise—A shaft or winze which has been worked from below.

Range—A mineral bearing belt of rocks.

Reacher—A slim prop reaching from one wall to the other.

Reamer—An enlarging tool.

Reef—The outcrop of a hard vein projecting above the surface; also applied to auriferous quartz lodes.

Regulator—A sliding door to apportion the amount of air to be admitted into a section of the mine.

Refining—The purification of crude metallic products.

Refractory—Resisting the action of heat and chemical reagents.

Reserves—Mineral standing in mines between shafts and levels that will pay to extract.

Retort—Amalgam after distillation; gold and silver combined with other metals.

Rhyolite—A name common to igneous rocks of wavy texture indicative of movement or flowing when in a fluid state.

Rib—A pillar of vein matter left to support roof or wall.

Riffles—Cross-blocks in a sluice box to catch the gold.

Rob—To gut a mine; to work for the ore in sight without regarding the supports, reserves or any future considerations.

Robbing—The taking of mineral from pillars.

Roof—The stratum or rock overlying a deposit, or flat vein. The top of a stope, adit, drift, or any horizontal working.

Rocker—A small trough, with an oscillating motion, used in placer mining.

Room—A working place in a flat mine; corresponds to stope in a steep vein.

Royalty—Percentage paid by lessees on the ore extracted.

Rusty—Oxidized. Metal coated with oxide. Applies to gold or silver which will not easily amalgamate.

Saddle—The ridge of a stratum or ore-bed.

Safety Cage—One supplied with safety appliances.

Safety Lamp—A lamp in which the flame is protected from immediate contact with the surrounding atmosphere.

Salting—Placing foreign ore in the crevices of a vein or elsewhere to fraudulently raise its apparent value.

Sample Works—Works for sampling and determining the values obtained in ores; where ores are bought and sold.

Samson Post—An upright supporting the working beam which communicates oscillatory motion to pump or drill rod.

Scale—The incrustation deposited in boilers from evaporated waters. A loosened fragment of rock threatening to break off and fall.

Schist—Crystalline or metamorphic rock with slaty structure; usually carrying mica, sometimes argillaceous.

Schistose—Granitic rock having a slaty structure, admitting of division into slabs.

Seam—A layer of mineral.

Seed Bag—A water-tight packing of flaxseed around the tube of a drill hole to prevent the influx into the hole of water from above.

Segregations—All those aggregations of ore having irregular form but definite limits. They differ from beds and lodes by the irregularity of their form; from impregnations by their definite limits.

Set—Portion of ground taken by a tributer; a frame of timber.

Selvage—Thin band of earthy matter between the walls and veins.

Shale—Fissile argillaceous rock. Generally soft.

Shaly—Brittle ground.

Sheave—A grooved wheel over which a rope is turned.

Shelly—Broken ground.

Shift—A miners' turn or spell of work. Two shifts imply 16 to 20 hours work; three shifts imply 24 hours work.

Shoot—To break rock by means of explosives.

Shute—An inclined board-way through which ore is delivered.

Silica—Silex or Quartz.

Siliceous—Quartz-bearing.

Sill—A windlass frame; the floor piece of a timber set.

Silver—A metallic element; the whitest of metals; specific gravity, 10.53; fusing point, 1873 degrees; symbol Ag. atomic weight, 108.

Silver Glance—An ore; when pure contains 87 per cent silver and 13 per cent sulphur.

Skip—A bucket or box used to hoist material from a mine.

Slag—Waste from smelter furnaces.

Slickensides—Polished walls of a vein, caused by trituration.

Slide—Timbers in shafts, etc., to guide buckets and materials; the mass of loose rock overlying each lode or country; one kind of a fault; a vertical dislocation of the vein.

Slimes—The finest of the crushed ore and gangue from the mills.

Slope—An inclined opening to a mine. It is an inside slope when it does not extend to the surface.

Sluice—A series of boxes set in line and floored with riffle blocks to catch the gold in placer mining.

Smelting—The reduction of metals from their ores in furnaces. It is a form of the word melt. In smelting the ore is melted. In other processes it is roasted.

Smift—A slow burning fuse.

Sole—The floor of a horizontal working.

Sollar—Any platform or wooden floor or covering in a working.

Spar—A general term applied to rock with distinct cleavage and luster; usually applied to the different lime formations.

Spilling—Timbering used in quicksand or loose ground where laths are driven behind timbers and kept flush with the heading.

Spilling—A process of timbering through soft ground.

Spit—To light a fuse.

Spoon—A slender iron rod with a cup-shaped projection at right angles to the rod, used in scraping drillings out of a bore hole.

Spreader—Timber stretched across a shaft or stope.

Spur—A branch of a vein.

Square Sets—A kind of timbering used in large spaces.

Squeeze—The closing of a room by the setting of the roof or the rising of the floor. The thinning away of a seam.

Squib—A slow fuse used for igniting an explosive.

Stamps—Weights for crushing ores.

Stamp Mill—A mill for crushing ores by means of stamps.

Station—Stopping places in shafts; places cut out for pumps, etc.

Stockwerke—A mass of country rock so impregnated by a congeries of veins as that the whole must be mined together.

Stope—The part of a vein above or below the drift, from which the ore has been removed.

Stoping—The act of breaking the ore above or below a level. When done from the back of a drift it is called overhand or back stoping; when from the sole it is underhand stoping.

Stoping Ground—The ore blocked out ready to remove.

Stowing—The debris of a vein thrown back of a miner to support the roof or hanging wall of an excavation.

Strata—A series of beds of rocks.

Stratified—Showing more or less distinct and separate layers or strata.

Stratum—A bed of rock or earth of any kind.

Streak—The color of a mineral when scratched.

Streak Powder—The powder obtained by filing a piece of mineral.

Strike—The extension of a lode or deposit on a horizontal line. Synonymous with trend and course. The discovery of pay ore.

Stringer—The same as Feeder.

Stripping—Uncovering an ore body on the surface.

Stulls—Framework to support the rubbish when stoping.

Stull Dirt or Stull Rock—Material supported upon the stulls.

Sublimation—The theory that the vein matter was introduced in a gaseous condition.

Sulphide—The chemical union of sulphur with a metal.

Sulphuret—A sulphide. Sulphide is the more recent and approved term. Synonymous with Pyrites.

Sulphurous—The odor of burning sulphur.

Sump—That part of the shaft below the platform to collect water.

Swamp Ore—Bog iron is sometimes called swamp ore, when found in low, wet ground.

Swab—The stick used to clean out blast holes.

Synclinal—The trough formed by the downward inclination of the strata from each side. The anticlinal being the ridge formed when the strata dips in opposite directions.

Syndicate—An association or council of persons; in use since the war to designate any combination formed to carry out a large financial enterprise.

Tackle—The windlass, rope and bucket.

Tailings—The refuse left after washing ores containing metals not saved in the first treatment.

Tamp—To hammer loose earth into a blast hole.

Tellurium—A silver white, brittle substance, generally classed among metals; usually combined with gold, silver, lead and copper. Sp. gr. 6.65; At. wt. 128. Symbol Te.

Tempering—The act of reheating and properly cooling a bar of metal to any desired degree of elasticity or hardness.

Throw—The amount of dislocation of a vein.

Ton—In metalliferous mines of the United States, 2000 lbs.

Tram—The pair of parallel lines of rails of a trackway.

Trammer—One who pushes cars along the track.

Trap—A door used for cutting off a ventilating current, which is occasionally opened for haulage or passage; guarded by a trapper. Any volcanic rock.

Trend—Dip or course of a vein from the perpendicular.

Tribute—A system of contract mining by which the miner receives his pay out of the gross value of the ore sold, less a certain deduction for royalty to the mine owner.

Tributers—Miners who work at a set, or piece of ground, taking the proceeds as wages, after royalty is deducted, but who work under the direction of the owners and hold no possession or title as lessees.

Triturate—To grind or pulverize.

Trouble—A fault.

Tufa—Any open porous rock.

Tut Work—Work paid for by the foot as distinguished from tribute work.

Unctuous—Having a greasy feeling like soapstone.

Underhand Work—Picking or drilling downward.

Underlie—The angle of a vein from the perpendicular.

Upcast—A ventilating shaft where the air ascends.

Upraise—A shaft or winze excavated upward.

Upthrow—An upward displacement of the side of a fault.

Valve Bucket—A bucket with a valve in the bottom for hoisting water.

Vein—Same as ledge.

Veins—Aggregation of mineral matter in fissures of rocks. The word vein has a broader scope than the word lode, including non-metallic beds. It is also applied, in working, to smaller seams threading the greater deposits.

Veinstone—The mineral in a vein which holds the ore.

Vena—A small vein or the branches of the veta, or main vein.

Veta—A main vein. (Spanish.)

Vitreous—The luster of broken glass.

Vug—A cavity in the ore or rock.

Wall—The plane of the country where it touches the side of the vein, when used in reference to lodes. The side of a level or drift, when used with reference to the workings.

Wall Plate—The long horizontal stick in timbering which is parallel to the vein.

Waste—The debris of an excavation. Gob. Goaf.

Weathered—Changed by exposure to the weather.

Wedging—The material, moss or wood, used to render the shaft lining tight.

Wheal—A pit or hole in the ground. A mine. The names of most mines in Cornwall are preceded by the word Wheal. Old form Huel. (Cornish.)

Whim—A machine for raising the bucket by means of a revolving drum.

Whip—An apparatus for raising the bucket with rope and pulleys, by horse power on a straight drive.

Whin—The Scotch name for hornstone.

White Damp—The noxious gas called carbonic-oxide gas.

Winch or Windlass—A hoisting machine consisting of a horizontal drum operated by crank-arm and manual labor.

Winning—Recovering ore left in a mine, or mining.

Workings—Any underground development from which ore is being extracted.

Winze—A shaft sunk from a level, not necessarily connecting two levels.

Zinc Blende—A combination of zinc and sulphur, often accompanied by other metals.

Zone—Used to specify a certain geological position of a strata or layer of rock.

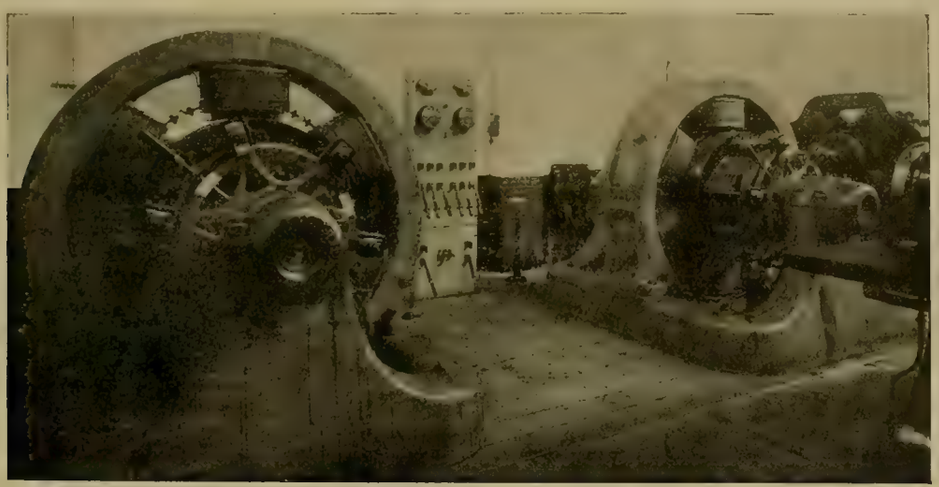
Electrical Progress.

Niagara in Harness.

November 16, 1896, marks an epoch in electrical history. One minute after midnight, with the closing of five sets of switches, the power from the cataract at Niagara was brought into the city of Buffalo.

The history of the generating station of the Niagara Falls Power Company is already so well known to our readers that we will not refer to it, except to say that the three great two-phase generators are all in use, furnishing power to the factories in and immediately around Niagara. The most recent addition to the power-house equipment is one of the General Electric Company's converters to take the two-phase current from the generators at 2200 volts and turn direct current into the lines of two or three railroad companies at a pressure of from 575 volts to 600 volts.

When the question of the transmission of power from Niagara to Buffalo was under discussion, the merits of the three-phase system as compared with the two-phase system for transmission purposes were canvassed. It was shown to the satisfaction of the Power Company that, in using the three-phase system for transmission, a large economy could be made in the transmission installation, and the three-phase system of the General Electric Company was selected.



THE ROTARY CONVERTERS AT BUFFALO.

The current from the falls is generated by the Niagara Falls Power Company, which transmits the power as far as the city limits of Buffalo. All the construction work in connection with this installation was effected by the Cataract Construction Company, while the distribution, after it has reached the city limits, is in the hands of a subcompany entitled "The Cataract Power & Conduit Co."

The two-phase current starting from the generators in the power house is led first to the switchboard and then in lead-covered cables through the covered "Bridge of Sighs," which passes over the canal of the Niagara Falls Power Company to a spacious transformer house, which has been erected on the opposite side of the canal. Here the cables are connected to four switches and pass to the step-up transformers, the largest in the world, erected on a platform at one end of the power house and placed over an air-tight chamber. Each has a capacity of 935-K. W. or 1250-H. P., and stands 94 inches high on a base 64x56 inches, and weighs 25,000 pounds.

The problem of cooling these transformers has been solved by driving a blast of cold air up through the air passages provided in the core and coils. The blast is furnished by a large blower driven by a 5-H. P. multipolar motor, which is bolted to it. It is in these transformers that the two-phase system is abandoned, and the current given three phases and raised from 2200 volts alternating to 11,000 volts. Provision is also made in these transformers for raising the voltage to 22,000 volts as soon as higher pressure shall have become necessary.

From the transformers three cables pass to the high-tension switchboard standing beside them. This switchboard is also of marble and carries three high-tension switches, each switch being separated by a marble barrier about 1 inch thick. This partition prevents arcing from switch to switch at the high pressure used. The switchboard also carries current indicators and three special fuse carriers. From the transformer house the wires pass through lightning arresters to the first pole of the pole line standing immediately in the rear of the building.

The pole line erected by White, Crosby & Co. runs along one side of a special right of way 30 feet wide. The number of poles in this line is about 21,000; they range from 35 to 65 feet in length and are set about 75 feet apart. Each pole is provided with two 12-feet cross-arms for the transmission line and one small cross-arm for a telephone line. Each side of each cross-beam has space for three pins to carry three insulators, provision being thus made for four circuits of three wires apiece, the capacity of each circuit being 5000 H. P. at 11,000 volts pressure and 10,000 H. P. at 22,000 volts pressure. On the outside of each upper cross-arm is a small iron pin, 18 inches high, which serves to carry a galvanized barbed wire, used as a lightning conductor and connected to the ground at the foot of every fifth pole.

The insulators used are of the double-petticoat pattern. Each weighs about twelve pounds and is provided with two annular grooves in the bottom, which effectually prevent any moisture getting to the central pin on which the insulator is placed. The outside of the insulator is provided with a gutter running to a point on each side to carry off the water. These insulators were subjected to a rigid test of 40,000 volts alternating, to determine the electrical resistance, and not until they had withstood this pressure satisfactorily were they accepted.

The length of the line is twenty-six miles. The overhead conductors are of bare, stranded copper, each conductor having a diameter of 350,000 circular mils, and each lies in a groove at the apex of the insulators. When this line approaches the station at Buffalo, which it does along the banks of the Erie canal, it is charged from overhead to underground, the wires passing from the last pole into a small brick terminal house. In this house connections are made with the underground cables through lightning arresters. The underground cable is rubber-covered and sheated with lead, and is of the same diameter as the overhead conductor. It is laid in a subway consisting of vitrified tile ducts, each duct having a hole 3 inches in diameter. The subway consists of twelve of these ducts, laid 18 inches below the surface of the ground, and surrounded on all sides by 4 inches of concrete. Three ducts only are in present use. The insulation of these cables was tested to withstand 80,000 volts.

The subway terminates in a small brick structure erected in the rear of the Niagara street power house of the Buffalo Railway Company. This contains the step-down transformers. On entering this small house, the wires are connected to another switchboard, carrying high-voltage switches and fuse carriers separated by partitions of marble in the same manner as on the high-tension switchboard at the Niagara Falls end of the transmission. From this board cables are carried through lightning arresters to the transformers, of which there are three, two being in use and the third being held in reserve. Each weighs 7000 pounds, is 82 inches high with a base measurement of 47x36 inches. In the step-down transformers the pressure is reduced from 10,700 volts to 370.

A system of coiling the transformers similar to that used with the step-up transformers at the Niagara end is used.

From the step-down transformers the three-phase current, divided into two circuits, passes over six cables to the main floor of the power house of the Buffalo Railway Company, where they are connected to another switchboard. Thence they pass to the two rotary converters, each of 500 H. P. capacity. These converters are six-pole machines and in their operation the three-phase alternating current at 370 volts is changed into direct current at 500 volts, suitable for delivery to the feeder line of the electric street railway. Each converter armature is provided with three collector rings at one side and a comutator at the other, and may be started either by the alternating current or by direct current from the railway lines. The converters may be used in parallel with the other generators, or the current can be thrown directly into the feeders of the railway system.

The lightning arresters of the Wirt type have been especially designed for heavy voltage transmission work and are single-pole. They consist of strips of marble, upon which are mounted eleven cylinders, giving one air-gap space $\frac{1}{32}$-inch for each 1000 volts, with an allowance of 25% rise in the potential. In the action of the arrester, the large metal cylinders serve to chill the arc, so that, on reversal of the current, the arc is extinguished, no dependence being placed upon any non-arcing property of the metal to put out the arc. In order to limit the current on short circuit, and thus the heating effect, a special solid graphite rod of low non-inductive resistance is used. The arresters are similar to those used on the Big Cottonwood transmission at Salt Lake City, which have effectually protected the machinery in many severe storms, and are now being used extensively in transmissions where high voltages are employed.

The entire apparatus used in the transmission of the current from Niagara Falls to Buffalo is from the shops of the General Electric Company, having been designed especially for this special service.

Scientific Progress.

Aluminum Cooking Utensils.

At a recent meeting of the Congress of Applied Chemistry Mr. Boroma spoke of aluminum as a material for cooking utensils as follows: "The utility of an aluminum dish, in respect to its fitness for culinary vessels, depends on the purity of the metal. A pure aluminum dish is almost, if not quite, as resistant to solvent effects of ordinary foods as any common metal. The impurities which do the most harm are sodium and carbon. When the aluminum contains carbon an electric current is at once set up when a suitable liquid is applied. In such cases after water, especially if it be saline, has stood in the dish for one or two weeks, the surface will be found dotted with brilliant rings, and, on scraping off the aluminum, the particle of carbon will be disclosed. If a strong solution of salt be used, the action may be sufficient to cause a perforation of the metal. The aluminum of commerce, unfortunately, is not very pure, and it is for this reason that so many aluminum dishes have shown a rapid deterioration. The French troops in Madagascar have been supplied with fifteen thousand sets of aluminum dishes, and, when a soldier has to carry his kitchen with him, the importance of lightness is not to be despised. But, even granting that in cooking in aluminum dishes a small amount of alumina is introduced into the food, it has not been shown that it exercises the least harmful action on the digestion. The experience of two men may be cited who lived for a year on food prepared exclusively in aluminum dishes without the slightest impairment of their health."

Bricks from Slag.

The manufacture of brick from blast furnace slag by the Bohemian Mining Company at their Karl-Emil works has increased from 200.000 bricks in 1888 to 12,100,000 in 1895. In the Karl-Emil blast furnaces limonite of the Bohemian sub-silurian formation is being refined by means of coke, whereby slag is produced. This slag, mixed in granulated condition with caustic lime, hardens to a cement-like mass, from which the so-called slag brick is produced. Such a slag brick, weighing about 10 pounds, can theoretically bear a burden of 38 pounds per square centimeter, though practically no heavier burden than about 25 pounds is ever put upon it. Hence, 1000 bricks can be piled safely above each other without any danger that the lowest one may be crushed by the weight. The broad side of the brick can bear a burden of 10,000 pounds. The manufacture of slag brick is based upon the principle that from granulated slag and caustic lime a cement-like mixture may be produced. The slag is transformed to sand, the latter mixed with lime-water of a consistency corresponding to the addition of lime desired, and the mixture formed into bricks and pressed.

THE idea that droughts occur in regular cycles of nineteen years has been advanced by H. C. Russell in a paper to the Royal Society of New South Wales. He finds historical evidence of three kinds of drought—the first lasting from three to seven years, the second more intense and relatively shorter, and a third that seems to rank between the other two and is more irregular. The different kinds occur on different years, but with the same interval. Since the year 900, with fifty-two recurrences of the nineteen-year period, the records show 78 droughts of the first kind in various countries, all of them fitting into this cycle, and filling 44 of the dates; while of the total of 208 recorded droughts for the same

time 193 fit into the cycle. Of 20 droughts before the Christian era, all but one fit in. There is evidence, moreover, that the nineteen-year weather cycle was known to the Jews, the Egyptians, and other ancient peoples. The existence of the cycle is confirmed by falls of red dust. Red dust is obviously proof of drought somewhere, and of the 69 recorded falls—the first in 738 B. C.—all fit into the cycle. For this weather periodicity Mr. Russell finds but one possible prime motor, the moon, thus settling to his satisfaction the question of lunar influence. It appears that when the eclipses congregate about the equinoxes—that is, in March and September—they do so in the years that give us great droughts; that when they accumulate in February and March and in August and September we have the more intense and shorter droughts of the second series; and when they accumulate about March and April and September and October we have droughts of the third class.

Mechanical Progress.

Fire-Proof Construction.

Practical and efficacious methods of fire-proof construction have been perfected only in recent years. Previous to 1890 the subject of "fire-proofing" had received little scientific study, and the practical work was largely in the hands of ignorant workmen. As a consequence, very few of the so-called fire-proof buildings erected before that time are actually fire-proof. While suitable materials have in many cases been employed in these buildings, they have not been intelligently adapted or suitably disposed. Insignificant fires in such buildings have resulted most disastrously, and in some instances have utterly wrecked the buildings. Careful investigation of the physical properties of structural iron and steel when subjected to heat, and close observation of the effect of fire and water on different materials, have within a comparatively short time developed efficient and economical methods of "fire-proofing."

The constant and increasing demand for fire-proof buildings has resulted in the development of forty-seven different systems of fire-proof construction, designed to serve the purpose of the clay products, at a reduced cost. Some of these, based upon correct mechanical principals and contemplating the use of none but suitable materials, are unquestionably fire-proof in the broad sense in which the term is now used, and deserve to be recognized and ranked according to their merits. Tests of the systems have in some cases been made, but generally by interested parties, under different conditions, and with the details of the construction not quite as they would be in practice. The lack of exact knowledge respecting the various systems, and the desire to ascertain the relative efficiency and fire-proof qualities of each, have actuated the department of buildings of New York City to conduct a series of careful and exhaustive tests. Each system is subjected to a severe fire and water test under identical conditions. For this purpose suitable structures are erected, according to plans furnished by the department of buildings, by each party desiring to make a test. Engineering Magazine.

Advance in Engine Indicators.

Several years ago an expert steam engineer was called on to prescribe a remedy for an engine that was not working smoothly, and was not as efficient as could be desired. He was asked what he would charge per day for indicating it and adjusting the valves, to which he replied, "Fifty dollars."

The owner of the engine wished to get everything done by the day as far as possible, in order to avoid paying unfair profits which he considered to be the rule where contract work prevailed, but this was a profit that he had not calculated on, so he promptly declined to pay it, in an emphatic manner. "Very well," responded the expert. "I will make you a proposition: I will indicate the engine, set the valves, and you shall pay me one-half of the value of the coal saved in six months, and I will accept your statement of the amount." As there was no possible chance for loss on such a basis it was readily agreed to, the job done, and at the end of the stipulated time the expert was paid more than six times the amount called for by his first proposition. But as the owner had saved a like amount during the same time there was no cause for dissatisfaction.

Such cases were always rare, but they are more so now than ever, because more indicators are manufactured, and the natural consequence is that engineers are familiar with them to an extent that was not thought possible a few years ago. Much credit for this desirable state of affairs is due to the societies of engineers that under various names are to be found in nearly every State in the Union, and which are doing a great work in educating their members.

The price of good instruments which answer every purpose for valve setting is so low that they are within reach of a majority of the craft, and even the most expensive kinds are now sold at reasonable prices. The result is that we find indicators in the hands of men who know little or nothing about them, but who are ready to learn their use and how to avoid their abuse.—Scientific Machinist.

Testing Cast Iron Car Wheels.

At the Altoona shops of the Pennsylvania Railroad a method of testing car wheels has been in vogue for some time which is creating a good deal of discussion. A sand mold is made around the tread of the wheel, which leaves a space of about 2 inches wide between the sand and the tread. Melted iron is then poured into this space. Engineers report that most of the wheels tested in this way broke or cracked in from 25 seconds to 1½ minutes from the time the metal was poured.

Many claim that the thermal test is not a practically fair one and is calculated to unduly alarm the traveling public. Nevertheless, the Pennsylvania Railroad officials at Altoona have been developing the test, and have reached the conclusion that in specifications for wheels which they buy a certain number in each lot received shall be subjected to a test of this kind, and if they do not stand it all are to be condemned.

It was ascertained that wheels which had been in service, or second hand wheels, did not stand the test as well as new ones. It is proposed hereafter to take three wheels from every 100, and subject one to a drop test and two to the thermal test.

THE following inexpensive method of testing steam gauges without the use of scientific instruments has been suggested by the *Scientific Machinist:* If you can erect a pipe of any size alongside of your stack or chimney, or at any other convenient place, it will answer for low pressure, for when filled with water, and the gauge attached, it will indicate a pressure that may be determined by multiplying the height of your column of water in feet by .434, provided the spring is accurate. If this is impracticable, you may obtain a brass tube whose area is 1 square inch, and fit a piston into it. Fill the tube about one-half full of water and fasten it in a vertical position. Put the piston into the tube and, having previously connected your gauge to the bottom of the tube, place a given number of pounds avoirdupois on the piston. The gauge should indicate a pressure equal to the weight applied. There will be some friction of the piston in the tube, but this may be practically overcome by revolving the weights by hand. To determine the diameter of this tube, divide the required area in square inches by .7854 and extract the square root of the quotient: $1 \div .7854 = 1.273$ and $\sqrt{1.273} = 1.127''$ diameter.

Practical Information.

The World's Oil Supply.

The market for petroleum and other crude oils is ever widening; it requires but a slight reduction in price to extend the use of oil fuel in ships and for other mechanical purposes, while the extreme simplicity of the oil motor has in recent years greatly extended its application; and now we are threatened with the oil motor car, which may or may not absorb an appreciable amount of the world's oil supply, says London *Engineering*. The United States and Russia are our great sources of supply; the former last year produced 53,000,000 barrels of forty-two gallons, and the latter 38,333,000 barrels, and carefully compiled statistics fail to account for more than 95,000,000 barrels as the world's production, but there is no doubt that much oil found is used locally, and therefore not accounted for.

That the supply is scarcely equal to the demand is in some measure indicated by the continued high level of rates. The output in the United States, especially in Ohio, Indiana and California, shows a great increase. Only once, in 1891, has the total been greater than that of 1895, already given, and withal stocks have greatly decreased. In the great Appalachian oil field, producing 31,000,000 out of the 53,000,000, the stocks only include 5,333,000 barrels. Thus prices have increased. Indeed, the average is higher than in any year since 1877, and the lowest rate last year was above the highest reached in 1894.

As to the prospects of increased supply, some interesting points are brought out in a recent report made to the Geological Department by Joseph D. Weeks: Between twenty and twenty-five promising wells have been sunk in the Appalachian field, two yielding about 6000 gallons per day. In the Los Angeles district of southern California there has been great extension, the total having trebled in three years. In Wyoming also there is increased activity, but the difficulty is the absence of cheap transportation.

It is, however, from Peru that the greatest augmentation of supply may be anticipated. The principal field is in the department of Piura, and estimates have been made as to the area yielding petroleum, one of them putting it as high as 7200 square miles. Since the Pennsylvania field is only 350 square miles and in thirty years has given forth 516,000,000 barrels, the prospects from Piura seem bright. Energy, it is said, is alone required. Of forty-nine wells bored since 1892, forty-four have been productive, and some of them yield 30,000 gallons per day. A London company has been working some of the wells, and the imports of oil have decreased to one-third the volume of 1889, the price of the local oil being one-third that of North American petroleum. Crude oil, too, is being used on the locomotives on all the Peruvian railways, in several manufacturing establishments, and in the gas works.

In Russia 269 new wells were drilled last year, 133 being deep wells, the average depth of all being 540 feet, and in six years 1371 wells have been drilled. The average number in operation now is 622, producing 38,000,000 barrels, of which 26,000,000 are pumped, the remainder flowing freely. The total output has been steadily increasing. In 1889 there were 278 wells, yielding 20,000,000 barrels; now 622 wells yield 38,333,000.

WHAT can be claimed to be the largest and fastest locomotives in the world are two which have been received by the Denver and Rio Grande Railway. They weigh seventy-four tons each without tender, and are said to be able to travel at a speed of seventy miles an hour, and have hauled trains of forty-five loaded freight cars in Colorado without effort. They will go into service on passenger trains and will be run entirely on the fast overland train service between Denver and Pueblo. These two locomotives are the heaviest in use for mountain traffic, and are what are called ten-wheeled passenger locomotives. Their dimensions are as follows: Boiler 64 inches diameter at smallest ring; firebox, 10 feet long by 3 feet 6 inches wide inside; number of flues, 274, 2¼ inches in diameter, 13 feet 4 inches long; working steam pressure, 200 pounds; cylinders, single expansion, 20 inches diameter, 26-inch stroke, with extension piston-rods; driving-wheels, 63 inches diameter over tires; truck wheels, steel-tired, 33 inches diameter; weight of engine on drivers, 118,000 pounds; weight on truck, 30,000 pounds; total weight in working condition, 148,000 pounds.

Proposed Canal.

Joseph R. Encke, Trenton, N. J., has been making a study of canals for thirty years and now proposes a great inland canal. He proposes that the Government build the canal by issuing non-interest-bearing bonds. The canal at the water line is to be 330 feet wide, 50 feet deep in the middle, 40 feet on the sides, and concave in shape, so that perfect docking can be secured on both sides of the dock. There are to be double locks, so that steamships going in opposite directions can pass through. There will be enough water to let any battleship or steamship go through at the same speed that it goes on the ocean. There is to be a railroad running parallel with the canal on one side, and the other side is to be devoted to industries. Dr. Encke, in an interview, said: "It will cost considerable money to build such a canal, but the revenues will be enormous. The Sultan of Turkey has secured a return of nine billions of dollars, and the investment is sixty millions, which was the cost of the Suez canal. The canal is to be lined with a double-faced wall, sides and bottom, on a concrete foundation, so that it will endure for 10,000 years. There will be enough water to insure speed. The rodents cannot harm such a wall. The building of this canal would furnish employment to many idle men. It would cut down the loss by storm on the ocean. It would give an inland route in times of war." The route would be from Sandy Hook bay across New Jersey into Delaware bay, then across the State of Delaware to the Mississippi valley, and up to the Great Lakes.

Progress in Japan.

At the last session of the Japanese diet the following sums were voted for industrial development: (1) Improvement of the existing government railways, 26,553,000 yen, the payment to be extended over six years. (2) Extension of the telephone system, 12,802,106 yen, the payment to be extended over seven years. (3) Construction of a railway in Hokkaido, 1,178,313 yen, the payment to be extended over two years. (4) Construction of an iron foundry, 4,095,793 yen, the payment to be extended over four years. (5) New marine telegraph cables, 536,877 yen, the payment to be extended over two years. (6) Purchase of arms and ammunition, 9,258,088 yen, the payment to be extended over six years. (7) Manufacture of arms for the army, 6,486,766 yen, the payment to be extended over four years. (8) Manufacture of arms for the navy, 33,751,062 yen, the payment to be extended over six years. (9) Construction of ships for the navy, 47,154,576 yen, the payment to be extended over seven years.

The last three items were pronounced altogether insufficient by leading statesmen and the press.

THE Supreme Court of Connecticut has recently handed down a decision of interest to bicycle riders. The court holds that the rider of a bicycle has not an absolute right to pass on the right hand side in meeting a vehicle which is turning toward that side to the curb of the street, nor can be assume that the driver must turn out for him, but is bound to exercise the same degree of care which the law requires of the driver of the vehicle to avoid a collision.

Recent Additions to the Museum of the California State Mining Bureau.

Gold quartz, very rich in free gold, Schwartz Kopjes, near Barberton, South African Republic; gold quartz, Sheba mine, near Barberton, S. A. R.; auriferous conglomerate, Ferreira and City and Suburban mines, Johannesburg, S. A. R.; all from A. E. Roberts, E. M.

Three large and very handsome slabs of polished travertine, from the California Travertine Co. of Bridgeport, Mono Co., Cal.

Curious triple geode of ferruginous sandstone from Texas.

Sylvanite telluride of gold, raw and roasted, the latter showing abundance of gold, Cripple Creek, Col.: R. M. Marshall.

Gold quartz, rich in free gold, from the McHaney or Desert Queen mine, in the Colorado desert, Cal.: W. M. Macmillan.

Auriferous vein matter, with cinnabar and accompanying minerals, orpiment, sulphur, etc., Sunshine mine, Mercur, Utah; Victor Heikes.

Rich gold quartz, with abundant free gold; St. Elmo mine, Randsburg district; D. M. Pyle, Cal.

Rich copper ore, Bullion mine, Manvel, San Bernardino Co.: J. W. Hixson.

Argentite (fine specimen), Mollie Gibson mine, Aspen, Col.: L. H. Pike.

Rich quicksilver ore, Rosebush mine, Savona's Ferry, B. C.; and gold, silver and copper ores from B. C.: J. A. Veatch.

Kraenkite and schwartzenbergite from Chuquicamata, Chile: C. von Reisebach.

Pilinite, large sheet of this peculiar mineral, New Almaden mine, Cal.: C. C. Derby.

Gold quartz from the Ford, Gwinn, Rose Kimberley, Everett, Golden Queen, Fair View, Louisiana, Drummond, Pride of the West, Junction and other California mines.

Auriferous pyrite and pyrrhotite, Le Roi mine, Trail Creek, B. C., and a number of gold and silver ores from the Colville reservation, Washington; L. E. Richardson.

Indian implements, rock specimens and various ores and minerals, etc.

HENRY S. DURDEN, Curator.

Recent California Mining Incorporations.

California Gold Mining Company, Benton Mono County: D. C. Albright, Mammoth; O. H. Hill, F. K. Andrews, Bishop; N. Thompson, Benton; G. P. Doyle, Chicago: capital stock, $100,000: subscribed, $500.

Oleta G. M. and P. Co., San Francisco: W. E. Holbrook, J. B. Goldstone, San Francisco; H. Routledge, Oleta: I. N. Chapman, A. Bannister, Alameda: capital stock, $2,000,000: subscribed, $2,500.

Willmore G. M. Co., San Francisco: J. B. Marvin, F. J. Castlehun, G. A. Bouteiller, J. Bazzini: capital stock, $100,000: subscribed, $500.

Mother Lode Electric Power Company, San Francisco: J. C. Jens, A. Woodside, T. Frolich, G. Gall, W. J. Woodside: capital stock, $200,000.

American Mining and Exploration Company, San Francisco: W. Kolman, F. McCue, Lewiston; W. H. Harrison, E. W. McKinley, J. A. Webster, San Francisco: capital stock, $250,000: subscribed, $250.

The Old Bonanza Mining Company, San Francisco: D. R. Oliver, A. P. Johnson, S. C. Wilmans, Sonora; C. S. Benedict, F. W. Wilmans, San Francisco: capital stock, $1,200,000: subscribed, $500.

Bunker Hill Hydraulic Mining Company, San Francisco: A. J. Hughes, J. J. Jones, Happy Camp; J. O. Stephens, S. E. Thurston, W. H. Lee, San Francisco: capital stock, $1,000,000.

Sierra Buttes Con. G. M. Co., San Francisco: W. H. and R. Martin, Nevada City; P. Tantphaus, E. F. Leibrich, F. Boeckman, San Francisco: capital stock, $1,000,000.

'49 M. M. and P. Co., San Francisco: A. Christensen, J. A. Dineen, C. A. Bennett, C. Swain, E. A. Herman, G. Peterson, W. W. Watson: capital stock, $1,500,000: subscribed, $70.

Recently Declared Mining Dividends.

Swansea Mining Co., Utah, $5000; payable Dec. 10th.

Sacramento, Mercur, Utah, $5000; payable Dec. 10th.

South Swansea, Utah, $7500; payable Dec. 21st.

Last Chance, British Columbia, $20,000; payable Dec. 1st.

Le Roi Mining and Smelting Company, 5 cents a share, or $25,000, Dec. 4, making $250,000 paid in 13 months.

It Brings Satisfactory Returns.

LOS ANGELES, CAL., Nov. 20th, 1896.

Curtis-Harrison Advertising Co., 349 Wilcox Building, Los Angeles, Cal., Agents Mining and Scientific Press—GENTLEMEN: We have received one hundred or more inquiries from our advertisement which we placed with you in the MINING AND SCIENTIFIC PRESS for three months. The result has been very satisfactory. Truly yours, GRIDER & DOW.

By L. M. GRIDER.

THE NEW GOLD FIELDS OF

British Columbia.

How to Reach Them Most Easily.

Correspondence Solicited.

Address BEAUMONT BOGGS, member British Columbia Board of Trade, Victoria, B. C.

Coast Industrial Notes.

—The hull of the new steamer Humboldt has been towed to this city from Eureka to have her machinery put in by the Fulton Iron Works.

—The largest brandy still in the world is at El Pinal, San Joaquin county, California. It makes enough brandy to keep 40,000 men continually drunk.

—The Secretary of the Treasury in his estimates asks for public buildings for the following cities the amounts named: Boise City, $130,270; Cheyenne, $186,969; Helena, $227,760; Portland, Or., $200,000; Pueblo, Col., $150,000; San Francisco, $100,000.

—The proposition to connect Santa Rosa with tidewater by an electric railroad is beginning to assume shape. N. W. Griswold states that the bonds have been placed in New York, and that as soon as the proceeds are received a contract for the construction of the road will be let.

—Nevada is not known as a cotton producing State, yet the Pioche *Record* says while the Bunkerville cotton crop this year will not exceed 20,000 pounds the product per acre is as good as usual, but the acreage was less. The cotton product of that settlement is ginned by water power and shipped to the woolen mills in Washington county, Utah, where it is exchanged for goods.

—The capital stock of the San Francisco Gas and Electric Company, which is the name under which the San Francisco Gas Light and the Edison Electric Light and Power companies have combined, will be $20,000,000, of which $13,816,000 will be issued as follows: To Gas Company stockholders, $10,000,000; to Edison Company stockholders, $2,750,000; to redeem bonds, $1,066,000. The balance of $6,184,000 will be held in the treasury.

Personal.

HENRY BRATNOBER is expected back from Colorado shortly.

ROBERT DUNCAN JR., superintendent of the Alaska-Treadwell properties is in the city.

C. J. JOHNSTON has gone to Johannesburg, South Africa, to take charge of some large mines.

JOHN F. KIPPER has been appointed superintendent of the Brunswick mine at Grass Valley.

ALFRED TREGIDGO of Grass Valley is about to leave for South Africa to take a position in one of the large mines there.

C. S. BATTERMAN has been appointed superintendent of the Boston & Montana Companys' properties in Butte, Montana. Mr. Batterman is a graduate of the College of Mines of the University of California.

BARCLAY BONTHORNE, W. GORDON ROSS AND THEODORE HADDEN arrived here from London last week, on their way to examine some mining properties in British Columbia. Mr. Bonthorne was commander of the Scottish corps at Johannesburg.

CAPTAIN THOMAS MEIN, the resident director of the Exploration Company of London, has returned from an examination of the company's extensive properties in Grant county, N. M., purchased for them two years ago by Louis Janin.

CHARLES BUTTERS, manager of the Rand Central Ore Reduction Company of South Africa, has arrived in New York on his way to California. Since his departure from California Mr. Butters has made a reputation as an authority in working ores, particularly in connection with the cyanide process, upon which his papers are of value.

IMPROVED MINERS' LANTERN.

A light, simple, cheap and efficient Lantern which will remain lighted in the strongest drafts. County or State rights for sale on royalty. MRS. HATTIE DELZELL, Jackson, Cal.

THE HARRINGTON & KING PERFORATING CO. CHICAGO.

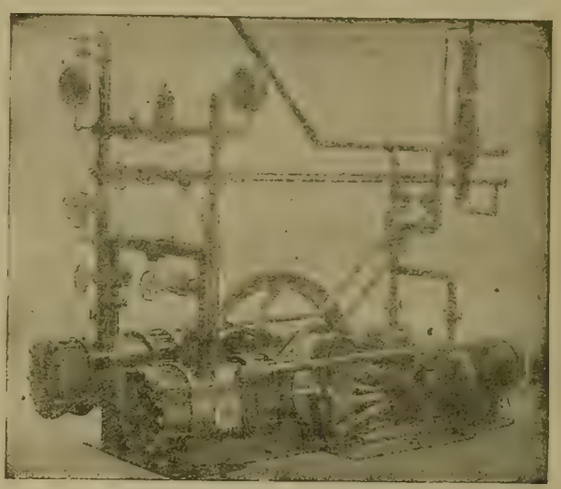
DOUBLE PIPE AIR COMPRESSOR.



This is a cut of the Double Pipe AirCompressor, the Compressor that is guaranteed to save 30% in power over any other make. It is cheapest to buy, cheapest to carry about and cheapest to run. If your fuel or water costs you anything, you want this Compressor. If you can get railroad freights free, and can carry machinery to your mine without cost, and your power costs you nothing, any make of Compressor will do you. You will be under no necessity to write to PNEUMATIC POWER CO., at 306 Pine St., San Francisco, Cal. We could save you money, though, in cost of foundations, as our Compressors are half the size of other makes.

MODERN MACHINERY.

Issued Monthly in the Interests of Machinists, Civil and Mechanical Engineers, and All Lines of Industry and Enterprise in which Machinery is Employed.

One Dollar Per Year. . . . Sample Copy Free.

Mining Summary.

CALIFORNIA.

Amador.

Dispatch: The 40-stamp mill at the Gwin mine has been started up. The shaft is down 1400 feet and drifts are being run from the 1200, 1300 and 1400-foot levels. From the 1300 and 1400-foot levels drifts will be run north and south at the same time. At present sinking below the 1400-foot level is being done in order to provide a proper sump for working the different levels.

At the Kennedy the new gallows frame for the hoist over the north shaft is nearing completion and will soon be ready for service.

The shaft at the Oneida mine is down over 600 feet. The new hoist has just been completed and housed in, and the machinery will be started up about the first of January. The engines are capable of hoisting seven tons 2000 feet in one minute. It is expected to go down 1800 feet before striking the ledge.

Record: A rich strike has been made in the Christianson gravel mine, above Volcano. The owner is purchasing machinery to crush the cement.

The Dane mine at Pine Grove is being thoroughly overhauled. The tunnel is being retimbered and a new 10-stamp mill erected by Smith Brothers.

The Acme mine, near McLaughlin Station, is again to be operated.

The porphyry deposit at the Robinson mine is about to be prospected by San Francisco men.

Republican: At the Anita, on the 500 level, the drifting has encountered ledge matter. The rock is of a peculiar character—porphyry, carrying a large percentage of good-looking sulphurets and some free gold. By hand mortar it gives a fair prospect in free gold. They have penetrated this formation 20 feet and drifted on it north and south. Considerable water is also encountered.

Rock is being hauled from the Argonaut to the Zeila mill for a test crushing.

Ledger: On the Gold Belt mine, recently discovered at Jackson, a shaft has been sunk and a crosscut run 30 feet passing through 18 feet of ledge matter.

Near Volcano work has been resumed at the Modoc, and all other mines are running full blast.

M. Christianson has struck rich pay gravel in what is known as the French claim.

Butte.

Mercury: J. B. Whitcomb, the receiver of the Spring Valley Gold Mining Company, is awaiting the redemption of the property recently purchased at foreclosure sale. It will cost the losers in the suit about $300,000 to redeem it. There are many men working on the company's claim at Cherokee Flat. They pay the receiver a royalty on the amount they take out and all do well apparently.

Register: Operations have been commenced upon the mine formerly owned by the Wiley Bros., which has always been believed to be rich, by an English company. Prof. Thomas Price is the agent for the company. Mr. Edwards is the superintendent in charge of the mine, and seven or eight men will be put to work upon it.

Calaveras.

Angels *Voice*: Sinclair and Betts, who held bonds on the Brunner and Romaggio mines, will put men at work in a couple of weeks sinking on both claims. The Brunner mine has a 30-foot ledge of $7 ore, and the shaft is down 160 feet with three crosscuts toward the east.

El Dorado.

Mountain Democrat: J. T. Smith has gone to Chicago to close the bargain for several mines near Greenwood, among which is the Golden Crown, a high-grade ore mine.

Smith and Shepherd will have a force of men at work on the White Elephant as soon as weather permits.

At the Baltic mine at Grizzly Flat the 5-stamp mill is running steadily on good ore. Their cleanup after a ten days' run yielded $2500.

Humboldt.

Blue Lake *Advocate*: The work on the Red Cap property has been discontinued for the winter. The ditch is constructed, while about 6500 feet of flume remain to be built yet. The flume is 3 feet deep and 6 feet wide, and when completed it will be 7200 feet long. It is understood that the suspension is only temporary. The company has located eight claims of twenty acres each. It is expected that early in the spring everything will be in readiness to begin mining.

Kern.

Californian: There has been organized a new mining district near the town of Majane called Majane. It takes the Jumbo mine for its center and includes the territory within 7½ miles in every direction. A stringent rule was adopted that every man filing a claim must commence work thereon within 60 days after recording. It is the absence of such a rule that has kept the Randsburg country back so long and prevented development. There are a number of rich mines already located in this district and considerable work has been done. From one mine 200 tons of ore has been shipped to the Selby Smelting Works and netted $15 a ton over all expenses.

Mariposa.

Miner: D. H. Oliver, of Stockton, is investing extensively in mining properties in the Moccasin creek district.

Goodall, Perkins & Co., of San Francisco, have resumed operations on the Baretta mine, at Hunters valley, on a new bond and expect to do extensive development work.

A number of men have been put on by the Merced Company during the past week. It is reported that the company intend doing a large amount of surface work in the near future.

The work of driving the tunnel on the Sunny Ridge mine was commenced last week.

Ballard and Martin, of the Rawhide, are trying their luck in Mariposa county on a mine upon which they have taken a bond; it is situated on Date's Flat.

Gazette: At the Rollins mine a tunnel is being driven by the parties who have it bonded. The tunnel is now in about 600 feet and will reach the main vein in a short time.

Nevada.

(Special Correspondence).—The lively foothill city of Nevada is rapidly becoming one of the most prosperous towns in the State. The streets, stores and hotel lobbies show a spirit of enterprise and enthusiasm rarely found, and nowhere except in prosperous mining sections. In the hotel corridors the uppermost topic is mines and mining. The town has a hundred guests looking for and experting on mining properties.

Within a radius of two miles there are 255 stamps dropping, and upon the regular pay day of one property alone—the Champion—the pay roll amounts to $15,000.

The contact vein here almost surrounds the city. As on the mother lode sections, so here, it has been found that mines are most valuable at great depth. The abandoned properties are again receiving attention, and deep mining is proving a success. Prospecting and the reopening of old mines are receiving attention in various sections of the county, both in and about Nevada City and in the outlying districts, particularly at Maybert.

The river banks on Deer creek, a mile below town, are studded with several plants that are a town in themselves—the Providence, the Cadmus and the Champion. The latter has eighty stamps in operation and forty are being added; preparations are under way to add forty in the spring. The Champion is down 1600 feet. This is one of the most perfect plants of its kind.

There is no drawback except perhaps the want of capital to open the idle properties. Local money is insufficient in quantity. Foreign capital, however, is finding its way hither. The people, particularly the rising generation, are alive to the situation. They encourage the idea of bonding properties at reasonable figures on long time to responsible people.

The following is a list of nearly all the properties in operation within two miles of town, and the number of stamps: The Gold Hill, 10 stamps, owned by Eastern people; the Mountaineer, 20, owned by San Jose people; the Providence, 40, owned by San Francisco people; the Pittsburgh, 10, owned by San Francisco people; the Mayflower, 20, owned by Nevada City people; the North Banner, 10, owned by San Francisco and Grass Valley people; the Federal Loan, 10, owned by San Francisco and local people; the California, 5, owned by A. D. Allen; the Stanford, 5, owned by Judge Caldwell; the Harmony, 10, gravel mine; the Delaware, 15, gravel mine; the Lone Star, 10; the Cadmus, 10, in course of construction; the Home, developing; the Champion, 80; the Spanish, 10, property of the Champion.

Development work is going on in every section. Hoisting works are being erected on extensive plans. Channel mining is receiving attention to a marked degree.

On the old Fortuna, one-half mile from town, a San Francisco company are doing development work on a large scale. They have a double-compartment vertical shaft down 400 feet, and are drifting on this level.

The Providence is down 1700 feet.

The Home is down 400 feet, and finds high-grade ore.

The Cadmus, a new property, has found high-grade ore. The mill is in course of construction.

The Kirkham, owned by San Francisco people, is down 270 feet.

The Champion is down 1600 feet.

The ore in this section, on the contact lode, runs from $6 to $60; forty-dollar ore is the average. Water power is available, and reasonable in price.

The great bonanza to Nevada county's mining interest is the recent completion of electric power works. The dam, flume and powerhouse are about six miles from Nevada City, on the Yuba river. The dam is 180 feet across the stream and 25 feet deep, of solid masonry and logs bolted to bedrock. The flume is three and one-half miles long and is capable of carrying 6000 inches of water. The construction of the flume alone cost over $50,000. The cities of Nevada and Grass Valley are both lighted from this plant. Two mines and two hoisting works take power from this plant. Two additional mines are preparing to run by electricity.

Nevada City, Dec. 8, '96.

The hoist in the Milliken Ranch gravel mine, owned by Poorman & Hastings, has been started up. A contract has been let to sink a double-compartment shaft, 5½x9, 500 feet. It is expected to sink 750 to 900 feet before striking the channel.

Transcript: A fine ledge has been uncovered in the Brunswick mine within the past few days. It is 18 inches wide, and was struck on the 900 level, 50 feet west of the shaft. The quartz is very rich, many of the pieces showing considerable free gold.

Fletcher, Kidder and others have bonded the Ellison gravel mine on Selby Hill. They are preparing to put up machinery above the Chaney ranch, near the Blue Tent road, and intend to run an incline into the hill.

At the California mine the tunnel which is to be 1800 feet long is now in 1200 feet and will tap the ledge at a depth of over 800 feet. The work is advancing now at the rate of 20 feet a week.

Transcript: A force of eight men are at work under Superintendent De Mott at the Blue Tent hydraulic mine, which is to be operated by drifting. No work has been done in this mine since the company was enjoined from hydraulicking fourteen years ago.

A rich strike was made at the Reward mine Saturday, when a good-sized ledge of fine quartz was encountered. The ore is heavily mineralized and shows considerable free gold. Indications are that an extensive pay chute has been struck.

It is reported that rich ore was struck in the Pittsburg mine last week.

The new incline shaft at the Delaware mine is now down over 500 feet, and the work of sinking is still going ahead. They are close to the main channel, and it will not be long before everything will be ready for breasting out and working the channel, which is known to be very rich.

Representatives of the syndicate of Sacramento men who recently bonded the Wright and Bailey claims, at Sweetland, have been making an examination of the property. The conditions of the bond are that a plant with a capacity for crushing 100 tons of ore per day shall be erected within six months; that the sum of $15,000 shall be paid for the claims within a year.

Placer.

Colfax *Sentinel*: A company has commenced work at Elmore Hill, in the claim owned by the California Powder Co. It is said that rich drift diggings were found there in early days, and it is thought there are some left.

The Horseshoe Bar Mining Company, under the management of Fred Roumage, has made extensive preparations to use the water carried by this flume to run hydraulic elevators. The immense flume being built by contractors is nearing completion. It is six miles long and has a carrying capacity of 1200 miners' inches of water.

Herald: At the Gold Blossom, owned by C. F. Reed of Auburn, about forty men are employed. At a depth of 300 feet the ledge is from 4 to 6 feet wide, and drift developments show that it is the largest as well as the richest body of ore ever opened up in the mine. The old Gold Blossom mill is not in running order and the ore is being milled at the new 10-stamp mill which Mr. Reed erected on the Eastern Gold Blossom about three years ago. Mr. Reed contemplates remodeling the old mill.

C. A. Reed is working a small force of men at the St. Lawrence. The upper tunnel is in about 700 feet on the ledge and opens up more than 300 feet of backs. The lower tunnel, which is about 50 feet deeper than the upper, is in 400 feet and shows a good-sized vein of high-grade ore.

At Ophir over 150 men are employed in the mines.

F. X. Lavallee has bonded the Green mine to E. W. Chapman, who has erected a hoist and has been engaged for some months in cleaning out and retimbering the old shaft, 300 feet deep.

C. C. Handy at Boulder has a force of six men. The 200-foot level, going west, is now in about 500 feet, with a strong ledge of good ore in sight. The 8-stamp mill on this property is kept going.

Five men are at work on the Morning Star mine.

The Hathaway shaft is now 600 feet deep. About sixty men are employed and the 20-stamp mill is kept going day and night.

The Bullion mine is being worked under bond by Rood & Ladd. There are two veins. The shaft has been sunk to a depth of 150 feet on the front or hanging wall ledge. At this depth levels have been run east and west on the ledge, showing a strong vein of fair ore.

Plumas.

Independent: At the Little Jamieson at Johnsville twenty-five men are working on the outside, and by the first of the year it is expected as many will be underground and the stamps dropping. The mill is nearly completed.

The Plumas-Eureka is working with a much reduced force and no prospecting is being done for new ore bodies.

Many smaller properties in the neighborhood of Johnsville are being placed in condition for working in the spring.

National-Bulletin: At the Standart & McGill mine a small force will be employed during the winter, as the condition of the road to the mill renders hauling impracticable. It contains a large body of low-grade ore, which could be worked cheaply with a mill, which the owners contemplate building.

The Four Hills mine is operating. The mill has been crushing ore during the past month. About thirty men are employed in connection with this property.

Riverside.

Independent: The new 5-stamp mill on the Dennis mine, near Perris, has started up.

The stamps at the new mill at the Green Lead mine, Holcomb valley, are now working. About twenty men are employed on the mine.

The group of five claims at Twenty-nine Palms, belonging to Wilson and others, was sold last week for cash to some mining men from the Cripple Creek country.

A strike has been made in the Gavilan mine at Perris.

San Diego.

Los Angeles *Times*: The report of the receiver of the Golden Cross mines at Hedges for the month ending November 15, shows receipts of $37,999, of which $25,758 is for bullion from the mines. Over $10,670 was paid for labor. The bank balance is $5350, and cash on hand, $6615. All debts contracted by the receiver have been paid.

There is a promise of increased activity in the development of the Picacho district mines, near Yuma, Ex-Senator Steve Dorsey is at the mines. Representatives of the machinery firm of Fraser & Chalmers of Chicago have been investigating the prospect with a view to erecting mills. In the estimation of the experts, there is enough $4 ore in sight to keep a mill of 300 stamps at work for a year. One deposit is 300 feet wide on the surface. It is understood that Banker Moffat of Denver is behind Dorsey in the development of these mines. Dorsey expects to start for London in about ten days on business connected with these properties.

Shasta.

Searchlight: The reports that rich strikes have been made in the Uncle Sam are without foundation. It is true that several miners are yet at work on that part of the ledge remaining unstoped between the shafts, but all paying ore has been pretty well removed; and as the ledge extending each way from the mine contains no rock worth treating, it is not likely that any great discovery will be made suddenly in this once valuable property which has paid to its stockholders over $900,000 in dividends.

At the National Consolidated Company's mine a 10-stamp mill is in operation and about twenty tons of ore is being crushed daily. A large amount of good ore is in sight in the stopes and rock is being taken out in four different places on the ledge. A shaft is being sunk from the lowest tunnel to develop to a greater depth. The force at present consists of thirty men.

Free Press: At French Gulch the Niagara is not getting out a great deal of ore, but what there is of it is of good quality. It lies in kidneys and works over $100 per ton. Seven tons were shipped to Selby's Works recently and returned something like $1400.

Hooper & Hubbard, under lease from Myers, have been working new ground in the Empire and getting ore worth $40 a ton.

J. J. Kelly is doing well on an abandoned location a short distance from the Washington mill. He has a tunnel in 200 feet on the second contact and is getting out rich ore which he has worked in the Washington mill. He has 150 feet of backs.

Sierra.

Nevada *Transcript*: The Scotch Company which took hold of the old Alaska mine at Pike City, have had representatives on the ground, and William P. Miller, the mining engineer who passed upon the Jumper mine of Tuolumne for Glasgow investors, has reported upon the work necessary to drain the mine. It is understood that his estimate amounts to $200,000 for cost of a tunnel from the Yuba, which, when finished, would give the company about 1800 feet of "backs" ensuring a large reserve of ore. This programme of work will be recommended by the visiting agents.

Siskiyou.

Reporter: The work of taking ore from the Columbia mine has been suspended for the winter months, but a small force of men will be employed in running tunnels and preparing for a large force in the spring. The mill will be enlarged in the spring or during the winter.

M. F. Campbell, who has the Quartz Hill mine bonded, was here last week. It is reported the flume in the old Shores ditch is to be rebuilt, and the mill upon this mine put in operation. Mr. Campbell has been trying to effect a sale of this property to a New York company.

The outlook for water for the hydraulic mines is splendid at present, and we may expect large runs next season, which will add greatly to the production of gold in Siskiyou.

Yreka *Journal*: Nothing has been done towards starting up the Gold Ball quartz mine, near Sawyer's Bar, and the 20-stamp mill will probably not be in operation for some time yet.

The Salmon River Mining Company's hydraulic mine, about six miles this side of Sawyer's Bar, is nearly ready to start up. This is one of the best equipped hydraulic plants in Siskiyou county.

The Mabel mine, near Scott Bar, owned by Chamberlain & Timmons, has been closed down for the winter after a successful run. The mine will be opened up in the spring, as soon as the weather will permit.

The Classic Hill mine on Indian creek, near Happy Camp, owned by Mathews & Vogan, has two giants at work.

Yreka *Journal*: The Klamath River Dredging Company is at work near Oak bar, and will no doubt be able to continue nearly all winter. Their plant is the largest of the kind ever built in the northern part of this State, those on the Sacramento being much smaller. A large proportion of the river bed from Oak bar down to Happy Camp has been located.

At the Bunker Hill mine, below Happy Camp, the owners will make a good cleanup. They have an abundance of water to keep their giants in operation.

Trinity.

Redding *Free Press*: The Altoona Quicksilver Mining Company have their entire plant under cover and will continue operations throughout the winter season.

George L. Carr at Carrville is pushing the development of his mine. He has completed 500 feet of an 800-foot tunnel, which he is running through the mountain. When the tunnel is completed he will decide upon a location for a stamp mill, which he will erect upon the property early next spring.

The Brown Bear Mining Company of Deadwood have resumed the shipment of sulphuretic ore by freight wagon from their mine to Redding, from which place it is shipped to the Selby Smelting Works at Vallejo Junction.

Journal: The Chinese company that bought the old Wilshire mine at Cox's bar have had Tom Montgomery survey a new ditch high enough to cover Peabody hill. This is known to be a good piece of ground, but white men thought it not large enough to justify the expense of cutting a ditch.

At Taylor's flat the Highland Mining Company are running their mine in full blast, the recent storms giving them sufficient water.

Tuolumne.

(Special Correspondence).—There are ten men now at work on the Modoc mine, and it is

expected that the mill will be running about February, 1897.

James Closter has found another rich mine about one mile from Buchanan. The vein is 4 feet wide and assays $12 per ton.

Mr. Bailey, a mining man from San Francisco, has been here for the last week looking for some good, cheap mining property. There is lots of good mining property here, but it is not cheap.

The Lady Washington mine is running night and day. The tunnel is in over 800 feet and the winze chute has been struck. This will give 900 feet of backs and the rock assays $40.

Senator Shine and Dr. Bromley have three men at work on the Wade & Carter mine.

The Edinburgh mine will be started up about the 1st of January, 1897.

Mr. Sharwood is still at work on the Grizzly.

Carters, Dec. 4th, '96.

Union-Democrat: The outlook is favorable for everything to be going full blast at the Lady Washington in a short while. Work on the shaft is progressing with considerable speed. When the mill starts crushing, good returns are looked for.

The managers of the Whisky Hill have decided to put in a hoisting engine right away, so that the shaft can be sunk with more speed.

The pumps have been started up at the Dead Horse, to pump the mine dry preparatory to resuming operations.

The Alabama property has been listed in London for $600,000. Superintendent Nevills is continuing the work of straightening the shaft and will soon have the big pumps to work, then sinking will be resumed.

A new hoist is being erected at the Alameda, and the owners contemplate the erection of a mill in the spring.

The framework for the new mill at the Confidence is nearly completed. The building will be large enough for forty stamps, though it is understood that but twenty will be put in to start with.

Yuba.

Marysville *Appeal*: At Brown's Valley the Damiebroge mine keeps 20 stamps running regularly.

The Flag mine will be started up again soon.

The Hibbert & Burris 5-stamp mill is working regularly on ore from the Sweet Vengeance.

NEVADA.

Reno *Gazette*: Mining implements, lumber and supplies are daily freighted from Elko to Gold Creek. If the weather continues favorable a larger force will be put to work on the ditch.

The *Central Nevadan* says if the Adelaide copper mine near Golconda turns out well there will be 300 men at work in it before spring. English capitalists have put ten or twelve men at work prospecting the mine with a view of determining its value.

Walker Lake *Bulletin*: Twenty-eight tons of ore were shipped from the Big Indian mine last week to Stewart & Harrington's mill at Soda. It yielded about $70 per ton.

White Pine *News*: At Cherry creek the Imperial Mining Company put some men to work, last week, at Exchequer mine, some good ore has been discovered over 800 feet in the tunnel.

De Lamar *Lode*: On the Magnolia, the first claim located in this district, a rich chute of ore has been encountered in the tunnel, which is now in 834 feet. Samples gave an average value of several hundred dollars to the ton.

The death of Thomas Gillespie has stopped all work at the Sterling, in Nye county.

On the April Fool some good showings have been made. The work on the property is principally tunnels, of which they have in all about one mile. The expenditures will range between $100,000 and $150,000.

White Pine *News*: The mines at Egan have closed down for the winter. The reason assigned is that the process of wet crushing now in use at the mill cannot be continued during the winter on account of the extreme cold in the canyon. A dry crusher will be put in in the spring.

OREGON.

Democrat: Twenty men are being put on the Flick Bar Mining Company's ditch, near Baker City.

The Flagstaff Mining Company has between forty and fifty men on its pay roll.

The Columbia mill has been started up.

Jacksonville *Democratic Times*: George B. Dornin will soon put in an improved 5-stamp mill at the Jewett mine, near Grant's pass.

The Louse creek mines, owned by A. Helms and others, have been bonded to R. G. O'Brien of Olympia, Wash.

Pfeil Bros.' mines, on Gall's creek, are being fitted up with a hydraulic plant and will be operated this season more extensively than ever.

The gold output of Galice creek district will be larger than ever this season, owing to the fact that mining operations are more extensive there than ever.

Placer mines will probably make a good showing this year, as the wet season seems to have set in earlier than usual.

The pumps have been taken out and work suspended at the Hammersly mine.

J. H. Beeman of Gold Hill, who has bonded the Roten ledge in Kane's creek district for California parties, is engaged in developing the proposition.

WASHINGTON.

Spokane *Chronicle*: In the Okanogan district the principal claims being worked this winter are the Ivanhoe, Triune, Wyandotte, King Solomon and the Rainbow. Wyandotte ore can be treated by the cyanide process, and that company has just put up a large mill that will handle about fifty tons per day.

On the Similkameen river a concentrator with a capacity of 100 tons will be built by a company composed of mine owners who are operating on Mount Ellemeham.

The big tunnel started to run into Palmer mountain from 1400 to 2000 feet will cut some thirteen ledges.

BRITISH COLUMBIA.

The Turner and Puyton factions have settled their differences in the management of the Le Roi mine. About 125 tons of ore are being hoisted daily, and this amount will be largely increased when the two extra drills are in operation. They are now working on the 500-foot level.

Should a proposed Red Mountain tunnel prove successful, it is intended to tunnel the Monte Cristo and other ore mountains in the vicinity of Rossland.

Spokesman-Review: The Reco Mining Company has been incorporated. The mine is developed by six tunnels an aggregate of 5000 feet, besides numerous upraises and crosscuts. A large force is at work, and the president of the company states that a dividend will be paid by March 1st.

The shipments from the Slocan will be unusually large this winter. At the Payne the owners expect to ship 1000 tons a month. The Antoine is shipping about sixty tons of high-grade ore a month. The railroad men are figuring on forty mines making shipments this winter, and that the total output will be at least 3000 tons a month.

Victoria *Times*: The control of the Elise mine on Wild Horse creek has passed into the hands of the British Columbia Exploration Company. The price was on a basis of $75,000 for the entire property,

The Wasa group of mines has been sold, and the first installment of $5000 has been paid. The Wasa group is situated about twelve miles from Fort Steele.

The North Star Company are working thirty men, and will take out from 6000 to 8000 tons of carbonates during the winter.

Rossland *Miner*: Gen. C. S. Warren has sold for $30,000, to a syndicate headed by Lieutenant-Governor McIntosh of the Northwest Territories, the Spotted Tail group, which consists of the Spotted Tail, Ida and Ida Fraction.

ALASKA.

Mining Record: At Berner bay the Julian Mining Company is now working a force of thirty men.

The crosscut tunnel which it was necessary to drive to tap the Comet mine and drain the upper workings of a heavy surface seepage is now in about 1850 feet, and the new vein is expected to be cut by the last of December.

UTAH.

Park *Record*: The Silver King, which was closed down by the cutting of the water pipes crossing the Crescent, has resumed work; 250 men were thrown out of employment during the shutdown.

In La Sal district interest is centered in the copper prospects thirty miles southeast at the south end of La Sal mountains. Parties from Colorado and Philadelphia have bonded the Copper King properties, owned by Maxwell, May, Young and King, in the big Indian district, for $50,000.

Salt Lake *Tribune*: The Union Pacific reports a heavier output from the mines of Tintic than at any time in the history of that district.

A shipment of forty-five tons received from the Humbug shows 128 ounces silver, 14 per cent lead and gold of the value of $7.50 per ton.

At Eureka the Sioux-Ajax tunnel has reached the 1500 station and is pushing forward day and night, with a probability that an ore chute will be broken into before Christmas.

About twenty tons of ore are being taken out of the Humbug daily. The ore during the past week will average about 500 ounces of silver, although some assays run over 700 ounces.

Iron ore is in demand at the smelters, and the Dragon iron mine is now shipping regularly.

Tintic *Miner*: Shipments were made as follows during the week: From the Bullion-Beck mine, 20 carloads ore; Bullion-Beck mill, 10 carloads concentrates: Centennial Eureka, 5 carloads ore: Eureka Hill, 12 carloads ore: Gemini, 5 carloads ore: Mammoth, 4 carloads ore: Ajax, 18 carloads ore; Sioux, 7 carloads ore; Buckeye, 2 carloads ore: Sunbeam, 1 carload ore: South Swansea, 5 carloads ore; Homestake and King James, 1 carload ore together: Dragon iron mine, 3 carloads ore daily.

The crosscut from the Independent-Tesora shaft has struck a 22-inch vein of ore in the Tesora ground.

The ore strike in the Grand Central is large in size, but, as was expected, low grade. There is no doubt, however, but that the property has the Mammoth ore channel.

The recent run of North Star ore through the Sioux mill—1000 tons—yielded an average of $9 gold and 13 ounces of silver.

Tribune: At Mercur it is reported that the Utica is negotiating for a sale to Eastern parties. There are nine claims in the property.

An Eastern company has bonded the Lydia group, comprising four claims, and will develop the property.

Nearly seventy men are now employed at the Golden Gate, and the lower levels of the property are being developed.

The Swansea is cutting out its station on the 550-foot level and will begin drifting for the vein. By those who have recently examined the property it is said that there is more ore in sight than at any time since its development was undertaken.

At Bingham a deal by which F. F. Frishie and C. S. Vadner acquire title to a group of mining claims in Carr Fork, above the Frisco, has been perfected, and development will go forward throughout the winter.

The ore shipments from Bingham for the month of November reached a total of 2400 tons.

At the Northern Light mine near Mercur, from the time the ore is shoveled into the cars at the working face until the tailings are shoveled out of the tanks, the work will be done by gravity. It is estimated that the cost of mining the ore will not be more than 50 cents per ton and the entire cost of mining and milling will be under $2. The mill is ready for the machinery.

The Golden Gate is employing about forty men and running three shifts. The work is mainly in sinking the upper shaft and blocking out the ore body. No new indications appear in regard to the early erection of a mill.

IDAHO.

(Special Correspondence.)—A number of reported sales did not go through, not owing to lack of value of the several properties, but owing to an overestimated value proportionate to the amount of development work. The miners, or, rather, holders of property here, are inclined to hold their prospects at mine prices, consequently very little capital is being invested. By so doing the property holders of this section are not only detrimental to the camp in general, but to their own interests.

Contracts have been let for driving tunnels on the Banner and Gold Bug. Some good ore is being taken from the Gold Bug.

The Ozark mill and mine are closed down for the present. A deal is pending on this property which, if consummated, will place it in the hands of men capable of handling it. The vein is about 3 feet wide and carries about 2 feet of ore which will mill $10 per ton. The development work has so far been done on a rather crude scale, consisting, as it does, of 400 feet of tunnel, which opens it up to a depth of 50 feet.

The Waverly mine will resume work in a short time with a large crew of men.

The Florence Mining, Milling and Reduction Co. has been recently organized by Moscow capital for the purpose of operating in this camp under the management of A. Walker.

The Red Brick mine is producing some rich ore. This property is in the hands of Spottiswood, Foster & Co.

Mr. Ledrow and Mr. King were in camp last week and have made a deal on the Oregon. They propose sinking 100 feet on the vein. This property is near the Kid claim, formerly purchased by the same parties. Both of these properties are rich in gold, but sufficient development has not been done to demonstrate their value.

There are numerous good properties in this section which, if they could be bought for a reasonable sum, would undoubtedly make producing mines. This is a camp which offers no opportunity for tunneling, and the only way to open it up to any advantage is to sink, and the large quantity of water makes steam pumps indispensable. Snow is now 4 feet deep, but it offers no obstacle when there is profit.

Florence, Dec. 5.

MONTANA.

Inter-Mountain: The final steps are being taken toward the reorganization of the Butte & Boston Co. The reorganized company will start with about $1,400,000 cash in its treasury, $1,500,000 6 per cent bonds, 200,000 shares outstanding, a finely equipped smelter in Meaderville and a rising copper market.

The contract for the new plant of 120 stamps, with both steam and electrical power, for the Diamond Hill gold mines, limited, has been awarded to the Union Iron Works of San Francisco. The mines are being opened with a large force of men. An air compressor with a capacity of ten drills will be used, driven by electricity, enabling the company to mine and reduce the ores in the plant for not to exceed 75 cents per ton.

The Gold Dredging Company has spent over $200,000 on the plant at Bannock and for the first time the work has been successful during the past summer. A satisfactory cleanup of gold from the creek bottom has been made for the summer's work. In May, 1896, Mr. Reiling conceived the idea of a boat with an endless chain of buckets working on a cable that would bring up the gravel from bedrock. The boat was constructed and twenty-seven buckets attached to the chain. As each bucket reaches the bottom of the creek it fills and the revolving chain brings it around to the top, where the load by an automatic arrangement is dumped into the grizzly. A stream of water is constantly playing on the gravel as it is dumped, and the smaller gravel and loose gold fall through the bars and is carried away through a flume.

Mining World: The Washoe Company has completed the new hoisting plant and shaft house on the Moonlight, and has three shifts at work sinking the shaft. The depth necessary to cut the lead will be about 1000 feet.

SOUTH DAKOTA.

Black Hills *Times*: At the Union Hill properties the experimental smelter is working thirty tons of ore a day, which yields nearly a ton of bullion: this bullion is worth from $250 to $300 per ton. About 100 miners are employed developing the various properties, and in every instance the ore bodies are large and have the appearance of permanency.

The Amazon Mining Company has about completed arrangements for the erection of a 20-stamp mill on their property, near Custer peak. The workings show a vein 30 feet wide, free-milling in character, which will yield from $4 to $5 gold per ton. With a 20-stamp mill, the cost of milling and mining should not exceed $2.50 per ton.

MICHIGAN.

Reports recently that the Calumet & Hecla Mining Co. contemplated building a new stamp mill are not correct. The company does not contemplate erecting any new stamps. It is expected that the Red Jacket shaft will be completed ready to hoist rock some time in '97, but it has not been determined when they will begin to hoist rock in it. This shaft is in the conglomerate lode and has been sunk to a depth of 4 00 feet, passing through and far below the lode. It was planned more as an insurance against interruption by fire in the other shafts in the future than for increasing output. At present the other shafts of the Calumet & Hecla supply all the copper it is deemed wise to raise from the mine in the present state of demand and supply. It can therefore be said that it is impossible to predict when the conditions will so alter as to make it desirable for the company to start hoisting from the Red Jacket shaft. The Calumet & Hecla has declared a dividend of $5 per share payable next Thursday. This makes $25 per share this year, and a total in dividends of $46,850,000.

In the Tamarack Mining Co.'s property the openings south of No. 3 shaft are exposing a lode from 16 to 18 feet in width which is rich in copper from the foot to the hanging wall, and is much better than the average of the mine. The general appearance of the lode in and about Nos. 1 and 2 shafts is about the same as for the past year. Everything in and about the mine seems to be running regularly and well.

The group of mines known as the Huron, Grand Portage and Isle Royal, south of Houghton, Mich., are reported sold. Operations will be started on one of them early in '97. The price mentioned as being paid for the group is about $125,000. Twelve years ago the Grand Portage and Isle Royal produced both together about 270,000 pounds of copper per annum: the Huron has produced as high as 2,370,000 pounds in 1888, but has done little or nothing the past three years. There is also a plan on foot to revive operations at the Ridge mine by calling an assessment of $1 per share if the approval of stockholders can be obtained.

COLORADO.

Denver *Republican*: At Cripple Creek the new main shaft of the Pharmacist has reached a depth of 350 feet.

The Anchoria-Leland company has made a shipment of two tons of ore expected to run not less than 250 ounces, or $5,000 to the ton, making one of the richest shipments in such quantity that has ever been made from the camp. Development at the mine goes on steadily, with the output holding at about $50,000 a month.

The output from the Isabella this month will be slightly heavier than last. The new ore in the seventh level proves to be the most important find made for many months.

If the several mines of the district follow their usual rule of increasing output in December, there will not be the least question but that the production of the Cripple Creek district for the present year will reach $10,000,000 and that in spite of the heavy loss occuring through the reduction of the Portland yield by the loss of the Anna Lee ore chute and from the Independence through its having shut down during the greater portion of the year.

It is said that W. S. Stratton is preparing to make the largest shipment of ore ever made from a gold mine to a smelter in thirty days, from the Independence property in December.

At Silverton the Royal Tiger has thirty mules at work on the trail, carrying ore to the mill and supplies to the mine.

Experts have been in the city to report on the Black Diamond, lying between the Iowa and Silver Lake.

The Shenandoah on Solomon mountain has made a big strike of rich ore. The mine has shipped about ten cars of ore, and the output will soon be increased.

The Guston management has decided to continue work during the winter. A development shaft 200 feet deen will be sunk.

The North Star on Solomon mountain will be worked all winter by a large force of men. The dump, which has been accumulating for the past ten years, is being shipped at the rate of eighty tons per day, and returns an average of $18 per ton. The mine is still shipping high-grade gray copper.

An effort is to be made to start up the mines and mill at Summitville, Rio Grande county. The mines in that district were once phenomenally rich.

Present indications show that the season of 1897 will be one of marked activity in a placer mining way in Routt county. The Hahn's Peak Mining Company propose as soon as spring opens to begin the enlargement and repair of flumes on their Elk river ditch. This ditch is nineteen miles in length. This company owns and controls about 2500 acres. The Willow Canyon Placer Company, controlling an equal amount of ground, will also put in a line of ditches to tap the same stream. These properties both lay at the southern base of Hahn's peak.

On the north side of the peak, a company composed of Illinois men have secured 1800 acres of ground, covering what is known as Red park. This ground has been located and abandoned for twenty years or more. This company will also construct a large ditch next season to take water from the south fork of Snake river.

Twenty Mile park will be represented by two hydraulic companies, one of these used giants the last season with good results, while the other will construct a ditch and reservoir and put in a plant early in the spring. Four Mile will be fully represented in the outfit of producers, while a dredging plant is being worked up to handle the sand bars of Bear river below the mouth of Fortification creek.

A number of the old mines in and around Capitol City will be started in the spring. It is authentically reported that the big Frank Hough mine will be put into shape early next spring and operated on an extensive scale.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING DECEMBER 1, 1896.

572,103.—SPRING HEEL—J. Bresman, S. F.
572,353.—AMALGAMATOR—W. L. & C. Brown, S. F.
572,469.—CIGAR TRAY—J Buchtel, Portland, Or.
572,331.—TOILET PAPER HOLDER—E. D. Casterline, San Jose, Cal.
572,408.—SASH FASTENER—C. J. Clarke, Kingsburg, Cal.
572,116.—CAR COUPLING—T. Fales, Bridgeport, Cal.
572,342.—REFINING BULLION—F. Gutzkow, S. F.
572,200.—SOLDER—G. Hammond, Mulberry, Cal.
572,167.—VENTILATED RECEPTACLE—W. E. Howell, Los Angeles, Cal.
572,360.—CAN HEADER—R. D. Hume, Gold Beach, Or.
572,362.—FLOUR DREDGE—W. D. F. Loryea, S. F.
572,305.—WIRE ROPEWAY—J. T. Ludlow, S. F.
572,345.—BUNG—C. J. Meyerholz, Mountain View, Cal
572,310.—DENTAL ENGINE HAND PIECE—C. O. Perkins, Petaluma, Cal.
572,127.—ROTARY ENGINE—R. Schlegel, S. F.
572,221.—FRUIT DRIER—A. B. Shearer, Arroyo Grande, Cal.
572,320.—CARD CUTTER—P. J Stuparich, S. F.
572,387.—BOTTLE—M. & L. W. Tebbetts, San Diego, Cal.
26,358.—DESIGN FOR HOSE NOZZLE—Kelly & Olson, Seattle, Wash.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

TOILET PAPER HOLDERS.—Edwin D. Casterline, San Jose, Cal. No. 572,331. Dated Dec. 1, 1896. This invention relates to serving apparatus and particularly to devices for holding toilet paper. It consists essentially in folding the paper alternately so that each sheet is interlocked with the next adjacent sheet, one leaf being folded over the leaf of the preceding sheet. The edge of the outer sheet projects through a slot or opening in a box or case which is closed upon all sides, and has a centrally located discharge slit through which the paper is withdrawn and means for introducing the paper thereinto. The enclosing box is placed in a permanent holder which has a locking spring or means for retaining the whole in place until the paper has been exhausted, when its containing box may be removed and another one inserted in its place, being locked in the same manner until the paper is exhausted.

CUTTERS FOR BEVEL CARDS.—Paul J. Stuparich, San Francisco, Cal. No. 572,320. Dated Dec. 1, 1896. This invention relates to an apparatus which is especially designed for forming beveled openings in cards or tablets which are designed for photographic mounts and other purposes. It consists essentially of a table, a removable plate secured thereon having a bevelled central opening, a vertically movable clamping plate having a bevelled opening made centrally therein, a vertical shaft turnable above the clamping plate with a transversely adjustable bar carried by the shaft having a head upon its outer end, a cutting blade, a means for clamping it to the head so as to stand at any desired angle and a means for rotating the shaft and the blade.

HAND PIECE FOR DENTAL ENGINES.—Charles O. Perkins, Petaluma, Cal. No. 572,310. Dated Dec. 1, 1896. This invention relates to a novel hand piece for dental engines. It consists essentially of a combination of parts whereby the bit or tool is easily introduced and removed with small loss of time. A rotatable spindle has a longitudinally split double coned socket at the end with the coned bases toward each other. A pin extends across from one side of the slit to the other and is adapted to engage and lock the flattened grooved shank of the tool after the latter is inserted, a ring is slidable upon the inner cone to clamp the two in place, and a casing enclosing the whole consists of a central and two end sections adapted to screw together, an opening being made in the front end section through which the sliding ring is movable while an adjustable collar fixed to the spindle abuts against the outer end of the central section of the casing.

AMALGAMATOR.—Wilfrid L. and Calvin Brown, San Francisco, Cal. No. 572,353. Dated Dec. 1, 1896. The object of this invention is to provide means whereby the ores after being properly pulverized and immersed in the solution placed in the tank so as to constitute a pulpy or fluid mass, may be given a rotary or circulating motion by the action of exhausting and discharging devices so that the pulp is continually caused to impinge upon the curved amalgamating plates within the tank, and thus the particles of metal are continually brought into contact with these amalgamating surfaces so as to eventually attach them thereto. In conjunction with this mechanism are electrodes suspended within a tank and connected with a source of electric energy whereby the action is more perfectly carried out.

FLOUR OR CONDIMENT DREDGE.—Wm. D. F. Loryea, San Francisco, Cal., assignor of one-half to E. S. Rosenblat and I. S. Rosenblat of same place. No. 572,362. Dated Dec. 1, 1896. This invention relates to a dredge for the sifting and discharge of flour, salt, pepper, spices and similar substances. It consists essentially of a containing chamber having a removable cap with radial perforations made therein, a longitudinal central shaft extending through the container, with a head fixed thereto having radial arms which normally coincide with and close the perforations in the cover. There is an enclosed case in the lower part into the inner end of which the shaft extends, and spiral threads are cut upon the shaft to engage with a direct reciprocating slide which surrounds the shaft within the outer case, having lugs which engage the spiral grooves in the shaft and a returning spring pressing against the end of the slide so that by the reciprocating movement of the slide, the rotary movement of the shaft and the arms upon its head is effected. This movement stirs up the material within the box and the latter being reversed alternately covers and uncovers the holes so as to sift and discharge the material there through.

"HISTORY OF CRIPPLE CREEK."

We have just issued in book form the only authentic and reliable history of Cripple Creek gold camp, the marvel of the mining world. The book contains numerous full-page illustrations (with map) of gold mines true to life. With the sole object of introducing our big 8-page 56-column illustrated weekly paper (established 1890) we will send a copy of the above interesting book free to all who send us 25c (stamps or silver), for a 3 months' (13 weeks) trial subscription to our big weekly, which contains the latest mining news and illustrations of Rocky mountain scenery. Club of 5 and 5 books, $1. Mention THE PRESS and address, *Illustrated Weekly*, Denver, Colo.

THE OVERLAND LIMITED,
VIA
UNION PACIFIC.
Only 3 1-2 Days to Chicago-----3 1-2.
Only 4 1-2 Days to New York---4 1-2.

The Union Pacific is the only line running Pullman double Drawing-Room sleepers and Dining Cars San Francisco to Chicago daily without change. Only one change to New York; dining car service entire distance. Vestibuled composite buffet smoking and library cars between Odgen and Chicago.

The only line running upholstered Pullman Tourist sleepers San Francisco to Chicago daily without change, and personally conducted excursions to St. Paul and Chicago without change, leaving San Francisco every Friday.

Tickets and sleeping-car reservations at No. 1 Montgomery St. Steamship tickets on sale to and from all points in Europe. D. W. HITCHCOCK, General Agent, San Francisco.

Over 370,000 Tons of Gold Ore.

Can be mined by tunnel, requiring no hoisting and no pumping. Will net $4 per ton above all expenses. In order to drive tunnel and erect a mill, we offer for sale limited number of shares at $1 each, payable 10 cents per share monthly. No assessments. Send cash or call. MARIPOSA GOLD CO., No. 3 California St., Room 61, San Francisco.

1607-8 Manhattan Building, Chicago, Illinois.

The General Gold Extracting Co., Ltd.,
PELATAN-CLERICI PROCESS.
Patented in U. S. and Other Countries. Capital, £100,000.
London Head Office.....8 Drapers Gardens.
Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.

This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.
Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.
F. CLERICI, Manager for U. S.

KENDALL GOLD AND SILVER EXTRACTION CO.
THE KENDALL PROCESS is the most efficient method of using cyanide for the extraction of precious metals from their ores. Wherever this process has been adopted the result has been increased percentages of values recovered and saving of time. Material reduction in consumption of chemicals has also been demonstrated with respect to several classes of ores.
All ores, without exception, amenable to cyanide treatment can be treated to better advantage by the Kendall Process. This can be accepted as an axiom.
The manager of one of the largest mines in the Mercur District, Utah, wires: "We now begin to understand dioxide process; last twenty days treated 220 tons per day of $26.50 ore, average of all tailings samples $0.83."
Owners of mines and reduction works can obtain full information on application to
KENDALL GOLD AND SILVER EXTRACTION CO.....47 Broadway, New York City.

THE GUTTA PERCHA AND RUBBER M'F'G CO.

30 and 32 FREMONT ST., SAN FRANCISCO.

Spadone's Concentrator Belts. Patented.

The "SPADONE" Curved Edge Concentrator Belt is attracting much attention among mining men, its merits appealing to the millman of practical experience.

Illustration (Fig. 1.) shows a cross-section, and (Fig. 2.) shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. *We avoid this Mechanical Defect by our Spadone Curved Edge.* Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

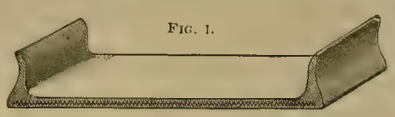

FIG. 1.

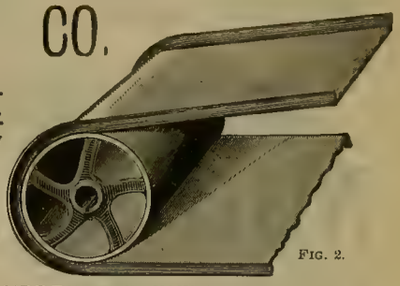

FIG. 2.

We shall be pleased to quote you also on Water, Air Drill, Steam, Suction and Fire HOSE, RUBBER BELTING and RUBBER PACKING. Correspondence Solicited.

Improved Self-Contained Cushion-Frame Five-Stamp Mill.
Patented in the United States and Foreign Countries.

The Improved, Iron-Frame, Self-Contained, Cushion-Frame, Five-Stamp Mill Saves Bills for Heavy Timbers, Millwright and Mechanics' Labor, and a Large Amount of Space. The term "Self-Contained" Means a Great Deal to the Mine Owner, and Can Be Readily Recognized and Appreciated in Making an Estimate For an Ordinary Five-Stamp Plant, When the Comparative Cost is Considered Over a Wood-Frame Mill.

FIRST: There is Saved by the Use of This Mill a Large Bill for Heavy Timbers, in Many Instances Obtained at Great Expense and Loss Of Time.

SECOND: The Saving in Mill-Wright and Mechanics' Labor in Framing and Erecting.

THIRD: The Large Amount of Space Saved.

Late improvements in the amalgamation and concentration of ores enable us to offer to the mining public, in connection with our Self-Contained Mills, an apparatus which amalgamates and concentrates at the same operation and provides a perfect trap for escaping quicksilver. Write to us for information.

Market Reports.

The Markets.

SAN FRANCISCO, Dec. 10, 1896.

Jobbers report that business is good in nearly all lines, with the call for holiday specialties exceptionally free. The volume of goods that went out on orders the past three months shows an increase of from 15 to 25 per cent over that during the corresponding time last year. The outlook is very hopeful for next years' business. With jobbers and others having close connection with the agricultural sections the opinion is freely expressed that their information is to the effect that a larger acreage will be seeded to wheat this year than any in the history of the State, and with that cereal commanding an average of $1.20 a cental farmers will come out with good profits. Jobbers connected with the mining district state that next year will not only witness a continued boom, but an enlargement in the gold mining industry. This improvement will not be confined to California alone, but extend to every State and Territory on the Pacific slope. In manufacturing circles there is a more cheerful feeling notwithstanding strong competition from the East, owing to cheap freights, cheaper raw material and lower wages.

The local money market is practically unchanged; the available supply in bank is steadily increasing, and as the avenues for placing money at good rates of interest decrease the rates of interest will ease. There is some calling in of funds by insurance and other companies to meet dividends, interest, etc., in next month, but it does not create friction. It is the consensus of opinion in financial circles that considerable more money will be offering after next year has been well entered. Considerable amounts will go out for the interest it will fetch, while there will be more disposition to invest in channels that offer special inducements for good returns. The East continues to report an easy market, with no decided demand for funds. The easy market at New York is causing more money to be invested in first-class securities, and also inquiry into the possibility of securing good investments in industrial and mining properties.

New York Silver Prices.

NEW YORK, Dec. 10.—Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.
Friday	29⅞	65⅛
Saturday	29⅞	65⅛
Monday	29⅞	65⅛
Tuesday	29⅞	65⅛
Wednesday	29 15-16	65¼
Thursday	29 15-16	65¼

	Copper.	Lead.	Iron.	Tin.
Friday	11 30	3 02½	11 00@13 00	12 90
Saturday	11 30	3 02½	11 00@13 00	12 90
Monday	11 30	3 00	11 00@13 00	12 95
Tuesday	11 35	3 00	11 00@13 00	13 00
Wednesday	11 35	2 97½	11 00@13 00	12 95

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, ⅝ per annum	7@8
Commercial Loans, prime	6@8
Call Loans, gilt edged	6@7
Call Loans, mixed securities	7@8
Mortgages, prime, taxes paid by lender	6@8
New York Sight Draft	10c Prem
New York Telegraphic Transfer	12½c Prem
London Bankers' 60 days	$4.84¼
London Merchants	$4.83¾
London Sight Bankers	$4.87½
Refined Silver, peroz., 1000 fine	65¼
Mexican Dollars	51½@52½

SILVER.—By referring to quotations above it will be seen that the market at the East and abroad held steadily up to Wednesday, when it strengthened slightly. From the general tenor of advices it looks very much as if better prices will rule after the turn of next year. This opinion is formed from information that the Indian Government is debating the question of going into the market to buy silver in connection with the financial pressure in that country due to famine. It may be induced to this course so as to offset any contemplated movement by Russia to coin silver so as to be prepared to make an entering wedge in the India trade.

MEXICAN DOLLARS.—The market has a stronger tone with a fair demand ruling.

QUICKSILVER.—There is a fairly active call for the close of the year for shipment by rail and water.

The market is quoted as follows:

Domestic trade, per flask	36 50

For export, quotations are nominal but less than for home.

COPPER.—There is a fairly firm tone to our market with a light inquiry ruling. Eastern advices state that the markets are firm with the tendency to advance owing to continued heavy consumption abroad and an increasing demand in this country with no corresponding increase in the output.

Ingot, jobbing	14¼@—
Ingot, wholesale	13½@—
Sheet copper	17 @—
Bolt	¼ & 5-16, 20c; ⅜ and larger, 17c
Lake Superior Sheathing	20

LEAD.—The market is barely steady owing to lower prices coming through from the East. The demand is light.

Our market is quoted as follows:

Pig	—	@	3 75
Bar	—	@	4 00
Sheet	—	@	5 25
Pipe	—	@	4 50

SHOT.—There is a good seasonable demand.

Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs			$1 20
Drop, B and larger sizes,	"	"	1 45
Buck, Balls and Chilled, do,	"	"	1 45

ANTIMONY.—Our market is quoted at 7½@8c in a jobbing way. New York mail advices quote 7¼@7½c for Cookson's, 6⅜@6⅝c for Hallett's and 6⅜c for Japanese, from store.

BORAX.—There is nothing new to report in the market.

The market is quoted as follows:

Refined, in car lots	5
Refined, in sacks	4¾
Powdered, in car lots	4½
Concentrated, "	5

TIN.—In both pig and plate business is light. The canning season will start up sometime in next month when there will be a better demand. According to the New York Metal Exchange the visible supply of pig for Europe and America was 33,303 tons on Nov. 3, this is a decrease of 180 on the supply October 31.

Pig, per lb	14¼c@—
Plate, I C coke, heavy, per box	—@$4 05
" " " light, "	—@3 95

IRON.—All information at hand justifies the belief that lower prices will be quoted next year. The decline in steel rails for next year's delivery has its influence as has stronger competitive selling of pig iron for delivery in next year.

AMERICAN.

	To Arrive.	Spot.
Sloss	$21 00	$23 50
Thomas	22 00	23 50
Salisbury	30 00	33 00

ENGLISH.

Barrow	$21 00	$23 00
Gartsherrie	21 50	23 00

POWDER.—There is nothing new to report. The market is quoted as follows:

Hercules, No. 1*, per pound	11½c
" No. 2, " "	8½c

COAL.—The demand shows an enlargement for both steam and domestic, but owing to the liberal supply on hand and to arrive the market is steady. The advance in freights from Europe and Australia has a favorable influence.

LUMBER.—There is a good outward movement.

Redwood, Fluming	17 00	@	— —
Pine	14 00	@	19 00
Spruce	26 00	@	31 00

NAILS.—The market is essentially unchanged.

The market is quoted as follows:

Wire, carloads, basis per keg	
" jobbing, " "	$2 75
Cut, carloads, " "	
" jobbing, " "	2 50

Mining Share Market.

SAN FRANCISCO, Dec. 10, 1896.

The market has fluctuated to lower prices. The first decline was brought about by reports received that the crossdrift on the 400-foot level of Chollar, on the Brunswick lode, was a failure. It was quite generally believed by the public that when the downward continuation of the ore was struck on the 400-foot level it would be wider and assay higher than that on the 300-foot level, and finding that the assays are low has been a decided disappointment. Under their selling the Chollar shares broke badly, causing lower prices for the entire list An assessment was levied by Hale & Norcross and another by Con. Virginia. While they were expected, yet the bears seized the opportunity to sell the market down. From the high prices of ten days ago the market was sold down from 40 to 65 per cent. The heavier decline was in Chollar and Potosi. It is stated that the 500-foot level will be opened soon for exploiting, but it is not at all likely any better results will follow. This opinion is hazarded on the work done years ago by the old Sutro Tunnel Co., when it struck the Brunswick at a depth of 1361 feet from the surface. Along this lode a drift was run northward and southward a distance of 100 feet. The vein was found to be a very strong one, and increasing in width as it sloped down from the surface, being about 100 feet wide at the tunnel level. The ore was found to be of a low grade. There can be no doubt that some day, when expenses have been further reduced, this ore can be extracted and taken out through the Comstock tunnel and made to yield a profit, but it cannot be made to pay from the surface workings unless a body of higher grade ore should be found. The work that is being done on the Brunswick lode does not attract attention, so the public is again turning to the Comstock.

From the Comstock mines there is very little of encouragement coming to hand. While the letters are devoid of interest, they tell of more or less work being done in the leading mines; and the well-known fact that, when least expected, a body of good to high grade ore has been struck which gave new life to it, causes many to believe that some such a surprise may yet take place. At present there does not seem to be any indications, so far as official information made public is concerned, to justify the expectation of a strike in the near future. The Alta letter reports that they are sinking on a streak of ore west of the bottom of the winze in the Keystone vein, which shows improvement. The ore assays $26.30 a ton. In Overman they are working on the 900-foot level. A few tons of about $30 ore are raised each week. Seg. Belcher and also Belcher continue to raise a few tons of ore each week while working on some unreported levels. Work had not, at last advices, been resumed in Crown Point. The work in Yellow Jacket continues to be kept quiet. In Confidence, Challenge and Con. Imperial there is no change in the work, so far as official letters report. In running the crossdrift in Alpha stringers of quartz continue to be cut. In Bullion work is continued in the north drift, with no change in formation reported and none expected for the better. In Potosi it looks as if preparations are being made to exploit the west croppings quite thoroughly. It is the belief that, if the work is run in the right direction, something of importance will be found. From Chollar nothing new comes to hand. The work is on the same levels heretofore reported. The work in Savage ought to begin soon to show to better advantage. In Hale & Norcross exploiting work is still the order. Now that the company has the Brunswick workings disposed of, all its resources will be bent toward finding a body of ore on the Comstock. Best & Belcher and Gould & Curry continue to drive ahead the joint east crossdrift. The material encountered does not show much encouragement. In Con. Virginia work is still being done on the 1000, 1650 and 1750-foot levels. So far as official letters are concerned, shareholders have very little to hope for soon unless an unexpected ore body is run into, which is not at all likely to take place. The number of tons raised last week was less than the preceding. In Ophir the west crossdrift on the 1000-foot level is being pushed ahead. On the Central tunnel they are driving a south drift. In this drift they passed through a quartz formation giving low assays. Work in Mexican is still toward the west on the 1000-foot level. Another crossdrift has been started. The work in Union is on the 900-foot level. In Sierra Nevada they are still working on the Layton tunnel level and also on the 900-foot level. In Andes they are running a west crossdrift on the 420-foot level.

From the Brunswick lode official advices are not of an encouraging character, so far as the immediate future is concerned. In Occidental they are exploiting the 550-foot and 850 foot levels. In Chollar they have not as yet found anything of consequence on the 400-foot level. The ore veins are wider, but poorer in grade. It is expected that work will soon be commenced to run a south drift from the Hale & Norcross 500-foot level. The expense of running north through Hale & Norcross ground will have to be borne by Chollar and running south by Savage. There is no particular change in the work that is being done by Savage, Gould & Curry and Best & Belcher.

It is expected that work will soon be completed of consolidating under one management Bodie, Bulwer, Mono and Standard, to be known as the Con. Standard, on the following basis: For two shares of Bodie one share of Standard will be issued, for three of Bulwer one of Standard and for six of Mono one of Standard. The new company will start out with $50,000 in cash and 21,000 shares in the treasury. The capital stock is 200,000 shares. The Standard shares sold this year as high as $3 a share. This mine has paid in dividends to the present time $5,400,000, and it is expected that, under the new management and consolidation, dividends will be again the order. There are 400,000 tons of tailings on the dump, which will be worked to advantage next year. The two cyanide plants have been shut down for the winter. Next spring more active work, it is reasonable to assume, will be inaugurated. The outlook for this district is quite hopeful, for the new management will work the mines on a legitimate business proposition.

Under date of Dec. 2nd, F. H. Pettingell writes from Colorado Springs, Colo.: "Those who write comments on mining stocks will be obliged to exert their ingenuity to a phenomena extent in order to satisfactorily explain the cause of the present slump, and those who are inclined to periodically predict glowing futures for everyone will find it exceedingly difficult to do so in a manner that will have weight with those who are disposed to think over matters. The principal trouble is that there is no outside demand for anything, and it is impossible for stocks to advance unless there is. The entire market is in an extremely sensitive condition. At the least sign of advance there is a general scramble to get in, but anyone who is at all familiar with the present situation can not conscientiously attempt to deny that the scarcity of buyers is positively appalling, and particularly so to those who are conducting large offices at great expense and carrying on a mining stock brokerage business in a high class manner. These are times when the most contented ones are the curbstone brokers, with offices in their hats. They have nothing to worry about, and comfortably recognize the advantage which they have over their more prosperous brethren of better times. There is another class who are also eminently well satisfied, and not at all effected by adverse conditions. These are the miners themselves who have passed through the siege of knocking unsuccessfully at the door of eastern capital, and amid hardships were forced to utilize their own resources, and develop their properties themselves which were industriously hawked about the country, and scorned by those who could have well afforded any possible loss that might accrue from an attempt to demonstrate their failure or success. The scorned miner is now the fortunate possessor of a dividend payer, and is enjoying the fruits of his numerous personal sacrifices cloaked in the garb of regular dividends. I believe that if every mine was forced to depend upon itself, and the enterprise of local capitalists, it would be far better in the end. What little amount of money we secure from the East is at an enormous sacrifice, and the profits are quickly absorbed and nothing said of them, but whenever a mining proposition fails, and there is any Eastern capital identified with it, there

Take All the Advice : : : : : :
On advertising you can get; but don't act on it unless it appeals to your own judgment.—Printers' Ink, N. Y., Dec. 2, 1896.

lsan immediate howl about the loss, and the dishonesty of the enterprise, and in fact everything that can be invented to cry down mining. Thousands and thousands of dollars are wasted in the pursuit of Eastern capital, and in the majority of cases without results. The most fortunate mining operators have brought about their success through their own efforts, or with the assistance of local capital. The East will buy a few hundred shares of wild cat stocks, or they will buy a large block of listed stock at $1.00 per share when it is selling at $1.30 here, and the moment they get it in their possession they throw it back on the original sellers at 25 to 50 per cent profit; in other words the ordinary Eastern mining investor will not buy unless they are assured they are getting the best of it. They seldom place any confidence in the promoter."

ANNUAL MEETING.—The Regular Annual Meeting of the stockholders of the Gould & Curry Silver Mining Company will be held at the office of the Company, Room No. 69, Nevada Block, No. 309 Montgomery street, San Francisco, California, on MONDAY, the 21st day of December, 1896, at the hour of 1 o'clock P. M. for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such other business as may come before the meeting. Transfer books will close on Friday, December 18, at 3 o'clock P. M.

ALFRED K. DURBROW, Secretary.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from C. W. & W. Martin, in the North Star mine, near Placerville, El Dorado Co., to deposit tailings in White Rock Creek; from Stevens, McKenney & Co., in the Boulder Hill mine, near Placerville, El Dorado Co., to deposit tailings in Kingoid creek; from Ah Sing, in the Hayden Hill mine, at Green Valley, Placer Co., to deposit tailings in an old pit; from George W. Jones, in the Buckeye Hill mine, near Nevada City, Nevada Co., to deposit tailings in a ravine; and from A. H. Holgate and others, in the Golden Gate mine, near Onion Valley, Plumas Co., to deposit tailings in Winter's creek, gives notice that a meeting will be held at Room 59, Flood Building, San Francisco, Cal., on December 21, 1896, at 1:30 P. M.

WANTED,

A position as Superintendent or Assistant Superintendent in copper-silver or silver-lead smelting works.

Understands mining, sampling, assaying, furnace management, handling men.

Prefer Mexico or Spanish South America. Speaks Spanish. Best references.

Address METALLURGIST, this office.

WANTED.—A position by competent and experienced Mining Engineer and Metallurgical Chemist. Thoroughly understands mining, mining machinery, assaying, ore treatment (including cyanide, chlorine and bromine) and handling men. Can take the tools from any miner's, mechanic's or machinist's hands and do his work. Can survey, draft, and keep books. Also understands electricity. Best of references. Will go anywhere. Address M. E. and C. E., care Mining and Scientific Press, San Francisco, Cal.

WANTED.

A Large Gold or Copper Property, located anywhere from Alaska to Mexico. Must have ore body developed 200 to 300 feet deep, with a large amount of payable ore actually in sight. Or a property with a large body of payable ore exposed sufficient to warrant extensive development work. No small property wanted. Send complete description to M. KUHN, 12 Front St., San Francisco.

WANTED.—A1 Mine Superintendent. State references and salary expected. Address Box 37, this office.

British Columbia.

W. J. R. COWELL, B.A., F.G.S., Mining Engineer, Reports on mines, designs and superintends the erection of mining and milling machinery; makes analyses of ores, metals, soils, etc.; arranges for mill tests, and selects suitable processes for the treatment of ores. Correspondence invited. Address W. J. R. COWELL, Victoria, B. C.

Assessment Notices.

OCCIDENTAL CONSOLIDATED MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Silver Star mining district, Storey county, Nevada.

Notice is hereby given that at a meeting of the Board of Directors held on the 24th day of November, 1896, an assessment (No. 25) of fifteen (15) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 29th day of December, 1896, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 18th day of January, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office—Room No. 69, Nevada block, No. 309 Montgomery street San Francisco, California.

JAMISON MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, on Jamison Creek, near Johnsville, Plumas County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 27th day of November, 1896, an assessment (No. 2) of five cents (5c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 120 Sutter street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of January, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 22nd day of March, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

SAM W. CHEYNEY, Secretary.

Office—Room 50, 120 Sutter street, San Francisco, California.

CON. CALIFORNIA AND VIRGINIA MINING Company.—Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 8th day of December, 1896, an assessment (No. 7), of 25 cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, Room No. 29, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 14th day of January, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the 4th day of February, 1897, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

A. W. HAVENS, Secretary.

Office—Room No. 29, Nevada Block, No. 309 Montgomery street, San Francisco, California.

HALE & NORCROSS SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey County, State of Nevada.

Notice is hereby given that at a meeting of the Board of Directors held on the 8th day of December, 1896, an assessment (No. 110) of 25 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 3, No. 331 Pine street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on MONDAY, the 11th day of January, 1897, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 1st day of February, 1897, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

R. U. COLLINS, Secretary.

Office—Room 3, Stock Exchange building, No. 331 Pine street, San Francisco, California.

THORPE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Fourth Crossing, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 14th day of October, 1896, an assessment (No. 4) of 5 cents per share was levied upon the issued capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 567 Market street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 12th day of December, 1896, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 9th day of January, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. F. FREY, Secretary.

Office—No. 567 Market street, San Francisco, California.

POSTPONEMENT.

The date of the delinquency of the above assessment is hereby postponed to the 22nd day of December, 1896, by order of the Board of Directors.

A. F. FREY, Secretary.

Room 44, Phelan building, San Francisco, California.

DELINQUENT SALE NOTICE.

GREENWOOD GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Greenwood, El Dorado county, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 1) levied on the Sixteenth (16th) day of October, 1896, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
Adams, Grove	7	11,000	220 00

And in accordance with law, and an order from the Board of Directors, made on the 16th day of October, 1896, so many shares of each parcel of such stock may be necessary, will be sold at public auction, at the office of the company, Room 79, Nevada Block, 309 Montgomery St., San Francisco, California, on MONDAY, the 14th day of December, 1896, at the hour of 1 o'clock P. M. of said day, to pay said Delinquent Assessment thereon, together with costs of advertising and expenses of sale.

CHAS. E. ELLIOTT, Secretary.

Office—Room 79, Nevada Block, 309 Montgomery St., San Francisco, California.

GOLD MINING PROPERTIES.

Having thoroughly canvassed this section of country during the past seven months, I am enabled to furnish valuable information to capitalists desirous of bonding or purchasing meritorious mining properties in El Dorado county. Prospects, partially or wholly developed properties, or purchasable interests ready for operation but lacking capital, can be had on favorable terms. Address, A. E. HAMILTON, P. O. Box 66, Placerville, Cal.

Assaying Gold AND Silver Ores.

By C. H. AARON.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:—Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel: Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 126 12-mo pages, with illustrations, well bound in cloth; 1896. Price $1.00 postpaid. Sold by the Mining and Scientific Press, 220 Market St., San Francisco.

Copper Matting in California.

The only regular shippers of copper matte, obtained from their own ores, in California, are the Iron Mountain Mines, Limited, of Shasta county. Their property consists of a group of mines known as the Iron Mountain, which is connected by a narrow-gauge railway with their reduction works at Keswick, near the town of Redding.

The mine is a large mass of copper sulphides, carrying varying amounts of copper, silver and gold. Mining is readily done by adits and drifts, the ore being stoped in a simple manner devised by Mr. Alex. Hill, the manager, who has had extended experience with similar deposits in Spain.

The ore, with the exception of the outcrop or gossan, is a very heavy sulpbide with but little silica. It is extremely fusible, and, for that reason, very reluctant in parting with its sulphur. The gossan contains varying values of silver and gold, and was at one time worked in an amalgamation mill on a rather limited scale.

The two accompanying cuts represent respectively the roasting stalls and the blast furnaces of the Keswick Smelting Works. As will be noticed, the former is arranged in terraces upon a hillside chosen for that purpose. At the time this picture was taken, two single rows of fifty stalls each were in operation and a double row containing one hundred in course of construction. This plant, when finished, will be able to supply two blast furnaces. The more stalls that can be placed in one line, the less smoke will annoy the workmen. The gases are best taken off in the center of these rows by a flue leading to the chimney on top of the hill. The floor line of one row is four feet above the top of the one next below.

BLAST FURNACES BUILT BY H. A. KELLER, AT KESWICK, CAL.

The kilns are built of heavy masonry, preferably of stone or slag brick, and require no binders. If thus built, with dimensions of six feet depth, seven feet wide and fourteen long, they are capable of holding a 35-ton charge and admit of economical filling and discharging.

It is found most desirable to roast this ore from 47% down to a residual of 10% sulphur. To do this requires, approximately, one-fourth cord of wood for each filling and at least four weeks' time. Faster roasting than that is apt to cause running together of the ore.

The charging is done direct by train coming from the mine, and the discharging by a similar train delivering the product to the furnaces.

The second view shows the Smelting Works proper with two blast furnaces, the site and arrangement of which were selected by Mr. Herbert Lang; while the furnace, as well as the roasters, were designed and operated by Mr. H. A. Keller. These furnaces are 42x150 inches at the tuyeres, with a 6-inch bosh at the sides and a distance of 9 feet from center of tuyeres to charge floor. They are made simply of two sets of water jackets with a plate underneath. For each furnace a No. 7 positive blower has been provided, and with it the furnace has a capacity of, easily, 200 tons of sulphides in twenty-four hours.

The blowers are driven direct from a water wheel and discharge into a main pipe, which carries the blast to the furnaces for distribution.

STALL ROASTERS BUILT BY H A. KELLER, AT KESWICK, CAL.

THE fact that American mining engineers have become the vogue with British syndicates will indirectly lead to much good to this country. Following the lead of the Britons, the French and Russians have begun to call for the assistance of Americans in opening up mines. But what promises to be of far greater importance is the fact that there is an increasing demand from South America for mining engineers from this country, and especially from California. This will do much towards making closer connection between this country and the Republics of the South in other lines than in mining.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Blast Furnaces Built by H. A. Keller at Keswick, Cal.; Stall Roasters Built by H. A. Keller at Keswick, 497.
EDITORIAL.—Copper Matting in California; American Mining Engineers in Europe, 497. "Good Will" of a Business; Cripple Creek Lodes; Proposition to Consolidate Plumas and Sierra Counties; The Nomadic Prospector; The Mining Bureau and the State; Cripple Creek and the Comstock, 498.
SCIENTIFIC PROGRESS.—The Roentgen Ray Cure for Blindness; To Detect Foul Air; The Metre Not a Standard Measure, 502.
ELECTRICAL PROGRESS.—Copper Refining by Electricity, 502. A Large Electric Plant, 503.
MECHANICAL PROGRESS.—Metallic Carbides; Inaccurate Glass Gauge Readings; A Bridge Over the Hudson River; To Keep Brass from Tarnishing, 503.
PRACTICAL INFORMATION.—Nature as an Engineer; The Largest Canals; British and American Navies; Patent Law in Mexico; Lead Shot; Flags Hoisted at Signalling, 503.
MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 506–7.
THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 514.
MISCELLANEOUS.—Concentrates, 499. The Solution and Precipitation of the Cyanide of Gold; A Colorado Comparison Between Cripple Creek and the Comstock, 500. The Mineral Deposits of Eastern California; Canada's Best Known Mines, 501. Nevada City District Geology, 502. Coast Industrial Notes; Commercial Paragraphs; Recent California Mining Incorporations; Recently Declared Mining Dividends; Personal, 505. List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents, 508.

The Mining Bureau and the State.

It behooves those interested in the State Mining Bureau to take some active steps immediately towards securing from the Legislature proper provision for its maintenance. Of all the industries, that of mining asks for and consequently obtains least from the State. No other publications from any State Bureau are in as great demand as those issued by the State Mineralogist and none do the State at large as much good.

With the present appropriations it is impossible for the assistants of the State Mineralogist to visit all portions of the State each year. A separation of the work of the bureau so that a geological survey may be undertaken independently as suggested by Mr. Crawford is necessary.

Most of the work of the Mining Bureau has been in connection with gold mining until lately, but within the past few years considerable attention has been paid to oil fields, deposits of coal, iron and other minerals. The State must be looked to for assistance in these directions or much effort will be lost in barren fields. It can only be to intelligent geological work that we can look for assistance in this direction.

The Nomadic Prospector.

The prospector on the Pacific coast has one great advantage over his brothers in most other mining regions. Like the birds he can change his habitat with the seasons and find congenial climates the year round. Hundreds of men who were in Alaska during the summer, and others who have been driven out of British Columbia and other parts of the northwest with the coming on of winter are now wandering over the deserts and mountains of the south from Tehachapi to New Mexico During the winter there will be no prospecting done in the north, but there promises to be greater activity than ever in the new fields in southern California, Arizona and New Mexico. Randsburg is attracting more attention than ever and outside of the district new finds are being reported.

It is probable that had the State of California good mining laws that would compel those who make locations to cease evading the intent of the Federal statutes, and do the required assessment work, much more development work would be done. As it is many of the first locators in the southern part of the State hold large numbers of claims and are not able to do even what the law requires. In many cases really good mines are located and finally abandoned because the locators do not develop them nor allow others to.

Cripple Creek and the Comstock.

No fair parallel can be drawn between the working of the mines of the Comstock in the early days of their history and those of Cripple Creek or any other mining camp opened within the past ten or fifteen years. In the article on page 500 of this issue taken from the Denver *Republican*, in the comparison of the cost of mining at Cripple Creek to-day and on the Comstock in the infancy of the silver mining industry in the United States, the almost innumerable adverse conditions required to be struggled with and overcome in the early days of Comstock mining are ignored. What was done at great cost, and often at great loss, on the Comstock in the early days is what now makes cheap working and good profits possible at Cripple Creek and at thousands of other mining camps in all parts of the world. Thus it will be seen that a parallel drawn between a mining camp of to-day in full possession of all the improved machinery and modern methods and processes and one in which everything was to be learned and discovered is rather invidious.

Besides, the wild and inhospitable character of the region in which the Comstock lode was situated should receive some consideration; also its remoteness from any adequate source of supply, the lack of any but the most primitive means of transportation and in places the entire absence of roads or even so much as a mule trail. At first all supplies were brought over the Sierras by mule trains and wagons and this continued nearly ten years before the Central Pacific railroad crossed the mountains. The cost of bringing heavy machinery and all the supplies required for thousands of people for every purpose from California was immense. Fuel and lumber were very dear and soon there was a great scarcity of water. To bring an adequate supply of water from the Sierra range cost $2,500,000. Then there were fires that swept the town and caused the loss of millions. The loss in the big fire of 1875 was over $10,000,000; the loss to the Bonanza mines alone was $1,461,000. Besides the fires on the surface in the towns there were several terrible fires in the lower levels of the mines.

When work first begun on the Comstock no one knew the depth to which the pay ore would extend, and all was mere conjecture in regard to what lay ahead. Thus it happened that heavier and heavier hoisting and pumping machinery became necessary, all the machinery first erected becoming useless. Also, in order to follow the dip of the lode to the east, it became necessary to sink new shafts, and always with more and more powerful pumps and hoisting apparatus. Not only were there great floods of cold water, but, presently, to the great surprise of the miners, there were inbursts of scalding hot water. The very rocks in which the men were obliged to work became burning hot in places. The great heat caused a demand for all kinds of "blowers" and ventilating apparatus. In short, almost endless difficulties were everywhere encountered and overcome, often after making many experiments and at great cost. The square timbers, alone, used in supporting the ground in the mines, cost millions, not to speak of lumber and fuel used on the surface.

In the early days the Comstock miners had neither air compressors, power drills nor high explosives. This made sinking and drifting slow work. A hundred labor-saving inventions now in use were then unknown. But improvements were constantly being made. The old world pumping machinery, hoisting machinery and ore-crushing machinery were overhauled and remodeled, besides which many new inventions in mining apparatus were made.

In the beginning American miners on the Pacific coast knew nothing about the extraction of silver from its ores; therefore, on the Comstock the methods of the Mexicans were at first used—the smelter, arrastra and the patio. These processes were found imperfect and too slow, and the same faults were developed when German processes were tried. Then was invented the American pan process, which immediately came into favor, owing to its rapidity, though far from being perfect at once, too many chemicals being used at first. All manner of crushing machinery and amalgamating apparatus were invented and tried, often at great cost. Then set in a rage for mills, and as early as the spring of 1862 there were over eighty mills in operation. Mills were put up on every canyon. Soon most of the money taken out of the first bonanzas had been put into all kinds of experimental mills and worthless amalgamating processes. Stockholders were responsible for much of this extravagance in the early days. They freely paid assessments and pushed mill building on mines without ore, as a means of raising the price of stocks in which they were speculating. Many lost sight of the mines and cared for nothing but mining shares. Men were often heard to say: "I don't want to hear how the mine is looking; the more I hear about it the less I know what move to make. What I want to know is what the stock is going to do." But all this was outside of mining operations, and had little to do with the real work in the lower levels.

As regards mines that failed to pay, no one could say until they were opened up that they were not as good as the best. The croppings all looked alike—some even more favorable than those of the Comstock—yet the lodes failed to pay. No camp has yet been found in which every lode contains a bonanza.

As to the great cost of operations on the Comstock, the same men that superintended the work on it in the early days—or any of the leading mining men of Montana, Utah or Colorado—could now take the lode, with all the modern improvements in use, and work it much more cheaply than was done. That is a proposition patent to everyone. It is a thing made possible by Comstock mining men and machinists.

It is to be hoped that Cripple Creek may produce $500,000,000. No one on this side of the continent would object. Even the best of the experts are unable to see a foot into the solid rock or to gauge possibilities. The greatest depth attained in Cripple Creek—850 feet—is a mere beginning, and at 3000 feet the mines may prove more comfortable than were the Comstock levels at half that depth. In fact, there was much less heat at a depth of 3000 feet in the Comstock than at several points above. There seemed nothing to prevent going to a depth of 5000 feet; but in 1882 a flow of water was tapped on the 2700 level of the Exchequer mine that flooded the Yellow Jacket and all the mines to the southwest, and they are still flooded, as the companies interested failed to agree in regard to the cost of pumping them out.

Such of the Cripple Creek lodes as are in contact with porphyry, phonolite and other dikes, and pass down through the volcanic breccia into the underlying granite without showing signs of weakening, are liable to prove paying to a great depth—perhaps as far as they can be followed. The small veins and fractures in the overlying lava-like material, however, are not likely to prove lasting. Their lease of life depends upon the thickness of the stratum of breccia through which they ramify. What the Cripple Creek miners will soon most want will be to find their veins safely launched on their way downward in the granite. Those who get into the granite may go on, but all others will stop.

A PROPOSITION has been made to consolidate Plumas and Sierra counties in order to reduce the rate of taxation, but it is not meeting with much favor. It has been pointed out that with the revival of the mining industry in those counties and consequent increase of value of property the rates will soon be largely decreased. In both Plumas and Sierra the total value of all property, according to the State Controller, has decreased slightly and the rates of taxation are somewhat higher, taking the figures of 1891 and 1895. However, in other mining counties a different story is told. Had either Plumas or Sierra as good communication with the outside world as those other counties the good effects of the revival of mining would have been felt sooner. There are no counties in the State in which greater increase in prosperity may be expected in the near future.

PRINTERS' INK, the best authority on advertising in the United States, refers to the analogy of the "good-will" of a business, and the cumulative effect of advertising. It says: "What is called the 'good-will' of a business is merely the cumulative effect of continuity. So with an advertisement; the longer it runs the greater its value. A business that has been continued for fifty years would lose its good-will in twelve months if once stopped, and very few men would care to pay much for it. Once advertising is stopped its cumulative effect is lost, and the longer it remains dead the harder it will be to make it effective when started again."

Concentrates.

LIKE Colorado, Nevada is now producing more gold than silver.

THE profits of the Silver Lake mine at Silverton, Colorado, for 1896 will approximate $800,000.

THE first through train from Spokane, Wash., to Rossland, B. C., went over the lines last week.

THE estimated population of the United States on the 1st inst. was 72,030,000; circulation per capita, $22.86.

A CONTRACT for running 600 feet of tunnel in the Morris Ravine mine in Butte county was carried out in 71 days.

D. C. CORBIN asserts his intention to build a smelter on the Spokane and Northern Railroad to work Trail Creek ores.

IN Santa Barbara county, near Serena, oil was lately discovered by running a tunnel in a deep gulch on the mountain side.

THE Southern Kootenay, B. C., shipments for 1896 amounted, up to the first of the month, to 27,200 tons, valued at $3,046,507.

FIRE devastated Jamestown, Tuolumne county, Cal., last Thursday. The town is four miles from Sonora and is known far and wide as "Jimtown."

AT Island Mountain, Idaho, a company that controls 10,000 acres of gravel has a force of 350 men building a reservoir and doing other equipment work.

THE Montana legislature will be called upon this winter to make several new counties in that State as a result of the development of new mining districts.

THE American Zinc-Lead Company of Canyon City, Colorado, are shipping twenty tons of copper ore daily from the Holland mine at Washington camp, Arizona.

THE Le Roi mine, in Trail Creek, B. C., is 500 feet deep and has paid $250,000 in dividends. The output is 150 tons a day, but this is to be increased to 300 tons.

MINE BELL SIGNALS, adopted, used and in force in accordance with all the legal requirements of the law on that subject, are furnished, printed on cloth, at this office.

THE State Supreme Court decides that the act providing that mining superintendents of California must make a weekly report to the stockholders is constitutional.

RESIDENTS of Los Angeles and San Bernardino counties are petitioning Congress to open the San Bernardino and San Gabriel Government reservations to mining locations.

THE Ashford Mining Company has been incorporated for $200,000, to work the King Solomon, Hector, Desert Queen, Kootenai and Magpie mines in the Randsburg, Cal., district.

THE Pedro Prieto property in Santa Eulalia district, Chihuahua, has been sold to the Mexican Ore Company who propose to develop it in an extensive scale and employ over 1000 men.

THE report of the State Mine Inspector of South Dakota will show that the output for 1896 from the Blacks Hills will exceed $7,000,000, of which $3,000,000 is from the Homestake properties. The product of the Black Hills for 1895 was less than $3,500,000.

THE largest orders anywhere in this country now given machinery manufacturers are from miners. The biggest enterprises now being started or in process of inception are mining propositions.

THE Southern Pacific Railroad Company last week filed a patent in the clerk's office of Siskiyou county, Cal., to 199,772.35 acres of land, some of which lies in that county and some in Jackson county, Oregon.

THE several newspapers published in the mining sections of this and other States are doing good work for the development of their respective localities, which should be recognized and encouraged by their constituents.

INCLEMENT weather in other localities is sending a large number of miners and prospectors to the "desert mines" in southeastern California, and whatever is there will be thoroughly exploited and explored this season.

THE Catron land bill has been defeated in Congress. This bill sought to allow aliens to acquire title to real property in the Territories under mortgage foreclosure, but provided that they must dispose of such within ten years.

THE Northwest Australia Goldfields Ltd. claim that they have been discovering diamonds among their auriferous conglomerates in the Nugalline district while working for gold. These conglomerates are similar to those of South Africa.

THE Champion mine at Grass Valley, Cal., has been offered to the Exploration Company of London, through Bratnober, and has for several weeks been under examination by Wartenweiler and Browne. It is probable that a sale will be made.

ARIZONA has a mining law which will not allow the relocating of claims to avoid assessment work. It compels the locators to do development work. Such a law is a necessity in California and it is to be hoped that it will pass the next Legislature.

A COMPANY has been organized in Glasgow, Scotland, under the name of the Meldrum Tunnel and Mining Syndicate, to run a tunnel 22,400 feet in length from near Ironton to the Telluride side of the mountain in Colorado. The cost is estimated at $2,000,000.

AT the Centennial-Eureka, Tintic, Utah, which has paid over $2,000,000 in dividends, they are working 1500 feet below the level of the surface and hoisting from that point ores that show from one to three ounces gold in addition to silver that frequently runs over 100 ounces.

THE Gold Creek Mining Company, north of Elko, Nev., is engaged in a very large gravel enterprise. They have 5000 acres of land and claim that a large part of it will yield 60 cents per cubic yard. From the large reservoirs they are building there will be a fall to a central ditch sufficient for 1000 H. P.

ON Lookout mountain, B. C., on one the claims of the Kohinoor group a tunnel that must have been run many years ago has been found. It has the appearance of having been made by the Hudson Bay Company when it occupied Fort Sheppard, the abandoned site of which is on the banks of the Columbia not far away.

THE War Eagle Mining Company of Rossland, B. C., has sued Charles T. Long, correspondent of the London *Standard*, for $10,000 for libel. This action arose out of the publication by the Victoria *Colonist* of a letter signed by Long, which intimated that the War Eagle management had been robbing the Poorman Fraction to swell its shipments and consequent dividends. The *Colonist* has since made a public retraction of the statements in that letter, alleging that it did not know to whom it referred.

THE antimony mines near Thompson Falls, Montana, have been leased to an Indiana man. It is claimed that these properties contain large deposits of antimony. Experiments have been going on for several years, and it is now claimed that a process has been found whereby the ore can be profitably worked.

THE Pandora Tunnel Company has been incorporated in Colorado, to run a 9x10-foot tunnel 6000 feet long at Telluride. It will run through the Marshall Basin and tap the Tomboy, Belmont, Japan-Climax, Flora, Occidental, Whale, Patrick Henry and Pandora. D. H. Moffatt and other capitalists are the incorporators.

PATRICK REDDY of this city last week obtained from his partners in the Randsburg company a bond on their interests at $150,000, half payable in 70 days and half in 100 days. Sixteen mines are involved in the deal, including the Olympus, which is regarded as the leading mine so far as developed in the Randsburg district.

THE Anaconda Company will make a better showing than ever in its history this year. Its output of copper has been materially increased since August and for the first ten months of this year the production of copper exceeds that of the whole of 1895 by 4,000,000 pounds. The output for the year will approximate 130,000,000 pounds.

THE Mount Bischoff, Australia, mine is probably the present largest single producer of tin in the world. Last year it yielded 2281 tons block tin. During the same period Bolivia exported to England from its mines 4,097 metric tons of tin. The Bolivian ore is the richest of which we have any knowledge, some of it carrying 65% metal.

FROM the water of the Anaconda and St. Lawrence mines, in Montana, one Ledford made, it is claimed, $60,000 in two years by precipitating the copper. His methods were crude and since the company took the concession from him they have put in an improved plant and will net from the water from all their mines $15,000 a month, it is said.

PERHAPS nothing better illustrates the need for immediate revision and amendment of the mining laws of California than the multitude of letters weekly received from miners all over the State making inquiry as to points of vital interest to them, but which are so contradictory and conflicting in law and court decisions as to perplex everyone.

TO SHOW that the camp is not boomed out of reason, the Rossland, B. C., *Miner* states that the population is over 6000. The number of miners at work for wages is 1300. In addition to the miners, there are 500 wood choppers and teamsters employed. Three sawmills furnish employment to 200 hands, and the railroads give permanent work to 200 more.

THE ancient Pegleg which has been discovered so often is still being sought for. At last accounts it was over the line in Mexico. According to the Arizona *Kicker* a deputy United States marshal knows where it is and has gone after it. It is to be hoped that he is supplied with proper extradition papers. This country cannot afford to lose the Pegleg.

LAST WEEK masked men took Capt. Meikle, the superintendent of the Garnett Consolidated Mining Company in Plumas county, from his house, mounted him on a horse and ordered him to leave. The next night a large number of men raided the cabins of the Chinese employed by Meikle's company and escorted them to Gibsonville and told them they would not be allowed to work in the mines.

THE list of California mines, miners, location of mine, post office address of owner and superintendent, etc., recently published in this paper, is being rehashed and republished in two or three quarters and used to coax money from "advertisers." It is probably unnecessary to say that this paper has nothing to do with such schemes. The information was originally published herein, and a complete list can be sent to anyone upon application.

ESTIMATES of the total cost of prospecting, locating, developing and working all the mines of Cripple Creek up to the present time show that not more than 50 cents have been expended for every dollar taken out. This is probably the best record ever made by any large camp, particularly where there is taken into consideration the fact that much of the money spent will be returned many fold from mines that have been proven of value, but as yet have not been worked much.

THE supervising special agent of the Treasury Department in his annual report opposes the erection of sampling works at Northport, Wash., and Bonners Ferry, Idaho. He says that the erection and operating of such sampling works will necessitate the expenditure of a large sum of money, and suggests instead that the ore be allowed to go forward to properly equipped smelting establishments, where a competent officer of the Government would ascertain the amount of the duty.

JUDGE BAKER, at Phœnix, Arizona, recently made a mining decision that will probably stand till overruled. In August, '94, L. P. Nash located the Overlook mine, put up one monument and his location notice, and no more. Sixty days subsequent he returned to complete his location and found L. J. Horton et al. in possession and brandishing shotguns. Nash brought suit, but the Judge decided that he "was guilty of unreasonable delay," and that defendants were entitled to the mining claim.

"WHAT," asks a Mariposa, Cal., subscriber, "is required to hold possession of a mill site?" In the case of Hartman vs. Smith, 7 Montana 19, the Court held that "all that is necessary to make the claim of a mill site by the owner of a noncontiguous mining claim valid is the reasonable use and occupation thereof for mining purposes in connection with a mining claim. A mill site may be patented by compliance with the same requirements regarding survey and notice as are applicable to veins or lodes."

ALTHOUGH the production of copper has been pushed, the world's supply in stock is continually decreasing. The total on hand at Dec. 1st of each year from 1891 to 1894 inclusive was about 55,000 tons. In 1895 it was 42,481 and for the past three months it has been about 30,000 tons. American exports to Europe for 1896 were 112,736 tons against 57,595 for the same period last year. The large increase in consumption of copper will be the cause of developing the many new discoveries made, particularly on the Pacific coast.

THERE is a similarity about the mining development work being done in Colorado and California that will be disappointing to many who do not look beneath the surface. The increase of this year's yield over that of last year in both States will be very small compared with the increased activity. The reason for this is that a very large proportion of the mines being developed, while proved to be valuable, will not begin producing in time to affect the total yield. It is probable, however, that the yield of 1897 in both States will far exceed that of 1896.

SOME good records in running tunnels are being made. In the big tunnel at Cripple Creek, being run to tap the mines, nearly 12 feet per day is being made. The Butterfield tunnel in Utah was run at the rate of 11.2 feet per day. The total length, 8280 feet, was run at the rate of 9.1 feet per day. In the Sioux-Ajax tunnel at Tintic, Utah, which is 9x10 feet, a daily rate of 9.2 feet per day was made with two shifts of eight hours each; but for short allowance of air for the drills three shifts could have been run and an average of 13.8 feet might have been estalished.

A CORRESPONDENT of the Redding *Free Press* claims that the arsenious and sulphuric acid fumes from the smelters of the Iron Mountain mines at Keswick will ruin vegetation in the neighborhood. He says that the present amount of ore treated is 450 tons a day and that this will soon be increased to 1000 tons, from which 250 tons of sulphur and arsenic will daily settle down on the surrounding country until nothing can survive its deadly effect for a distance of fifteen miles or more. He suggests that condensers be put in to protect the public from the effects of this. The matter is probably exaggerated.

THE Exploration Company of London, through Hamilton Smith, have purchased 50 per cent of the stock of the Helena & Frisco mine, in the Cœur d'Alene country, Idaho, at the rate of $900,000 for the whole property. The mine, although it has had to erect three mills, has paid $500,000 in dividends. The first mill was blown up during the great strikes and the second was a failure and had to be torn down. The mine is a silver producer and employs 250 men. The Exploration Company last week also finally concluded to accept the reports of the experts on the Tomboy at Telluride, Col., and closed the deal for the purchase of that property.

THERE has been issued by the State Mining Bureau, in pamphlet form, that part of the forthcoming annual report that deals with the resources of Trinity county. Mr. Crawford has suggested that similar publications be made as to the other leading mining counties of the State, and it is to be hoped that provision will be made for carrying it out. The main product of Trinity county is gold from its immense placer deposits; but of late there have been very important developments of quartz, that give promise of making it one of the first counties in that direction. The other mineral products found in Trinity are quicksilver, copper, coal, granite, marble and platinum.

THERE is a great difference between the manner in which the European, the Eastern and the local capitalist invests in California mines. The Boston man and most of those from the Eastern States look for paying properties. He wants a sure thing and does not care to prospect or develop. The European, particularly the English investor, will take hold of big partially developed properties that promise well and spend money liberally to open them up. However, he wants big things and will pay well for them. The Californian prefers prospects for which he will have to pay little until he proves up the property. He does more in the way of opening up of new mines and new districts than the others. The Californian who has money to invest is more apt to put it in the newer districts than into the older camps.

CHARLES BUTTERS on his return from South Africa in an interview in New York gave out the idea that the Transvaal government is awakening to the idea that its "dog in the manger" policy is not what will be for their own good. He said: "The Transvaal government is now settling down to assist the mining interests in every possible way. The government feels that absolutely essential. A large amount of capital that has been there is going to Australia or New Zealand or else coming to this country. Many capitalists think that less attention has been paid to the gold resources of the United States than should be the case. Foreign, as well as American capitalists, are now turning their attention to this country and are sending engineers directly into the field, so that the slump in values in the Transvaal is really a benefit to other gold producing countries."

IN speaking of the recent decision on the right of placer claimants by Land Commissioner Lamoreux, Senator Teller of Colorado says that the former rulings of the Land Office, which have been apparently reversed by this latest decision, have been in existence for the past half century, and, while he has not had an opportunity of examining the case, he could not see any special reason for the position taken by Lamoreux. "I have no doubt," says he, "if the bill proposed by the California miners comes before Congress—to put the practice of the Department into the form of statutory law—it will be passed, unless the Secretary of the Interior should reverse the decision of his subordinates. It has always been customary to put sulphur, borax, kaolin and like minerals not in place under the provisions of the laws governing placer claims, and I fail to see any reason why they should not be still maintained in that category. The bill will certainly receive attention if it comes before Congress." Lamoreux's decision was in favor of the Northern Pacific Railroad Company and against a placer claimant.

J. C. F. JOHNSON of Adelaide, Australia, at a recent scientific meeting there, exhibited specimens of non-gold-bearing rock, in which he had artificially introduced gold in the interstices and on the face "in such a manner as to defy detection, even by skilled experts. Some of these specimens were shown privately to several distinguished geologists, who expressed great surprise at the remarkable character of the exhibition." The discovery, some years ago, that gold could be induced to deposit from its mineral salt to the metallic state on any suitable base, such as iron sulphide, led Mr. Johnson to experiment with various salts of gold, and by which he has produced most natural looking specimens of auriferous quartz from rock which, from previous assay, contained no trace of gold. Moreover, the gold which penetrates the stone in such a thorough manner assumes some of the more natural forms. In one specimen shown, the gold not only appears on the surface, but penetrates each of the laminations, as was proved by breaking. While this knowledge of how gold was probably deposited may help to suggest how it may be economically extracted, the thought also occurs what a power of harm it would be in unscrupulous hands for the fraudulent "salting" of mines.

The Solution and Precipitation of the Cyanide of Gold.*

By S. B. CHRISTY, Professor of Mining and Metallurgy, University of California, Berkeley, Cal.

The fact that many millions of gold have been extracted by the cyanide process during the last five or six years from South African tailings which could not be profitably worked by any other method previously tried upon them, lends a peculiar practical interest to this branch of metallurgy.

Numerous writers have recently made valuable contributions on the process without exhausting the many complexities of the subject. Among the first American writers on the subject in its modern aspect were two former students of the University of California, Mr. Louis Janin Jr. and Mr. Charles Butters. Young Janin was one of the first to enter this field, and performed much useful experimental work in the early stages of the history of the process.

At about the same time Mr. Charles Butters, who had left California to erect chlorination works for the Robinson mine at Johannesburg, became interested in the cyanide process, and, after getting the chlorination plant in working order, erected, for working the tailings from the Robinson mine, a cyanide plant which achieved the first large-scale success ever made with this process.

The papers which Charles Butters, together with John E. Clennell and Edgar Smart, have contributed on the chemistry of the process, were among the first to give any adequate idea of its nature.

Another important contribution to the literature of the subject is the paper of Dr. A. Scheidell, published in 1893 as a "Bulletin of the California State Mining Bureau." This contains an admirable summary of the state of the art at the time of its publication.

Many notable contributions have been made by others, some of which will be referred to in what follows, as called for by the context.

The rapid extension of this process in South Africa s evidenced by the value of the cyanide product for the Witwatersrand district. In 1890 it was less than $6000; in 1891 it had grown to over $60,000; in 1892 to over $3,000,000; in 1893 to over $6,000,000; and it is still increasing.

Although, several years before 1891, I had obtained some very promising extractions from gold ores by the use of cyanide of potassium solutions, I was prevented until that year, by the constant pressure of other duties, from any systematic study of the subject. In the experimental work then commenced I was aided by several of my students, more especially by Mr. Thomas E. Eichbaum, who at the time of his death, a couple of years later, was chemist for Mr. Almarin Paul at his cyanide works in Shasta county, Cal.; Mr. C. W. Merrill, who has since erected cyanide plants at Bodie, Cal., and at Harquahala, Arizona; Mr. Leslie Simpson, now in South Africa; Mr. H. C. Baldwin, now in Mexico, and Mr. F. Booth, now in Alaska.

The result of these studies, made on a large variety of ores, was to show in all cases a partial extraction of gold. This extraction varied from 20 per cent to 95 per cent. While it was always easy to make a partial extraction of the gold, it proved difficult, in many cases impossible, to get anything like a complete extraction. Another difficulty encountered in these experiments was that very dissimilar results were often obtained with ores of almost exactly the same composition.

A careful study of all this preliminary work soon convinced me that two equally important classes of causes were active in bringing about these variations in the result: the one of a chemical, the other of a mechanical nature. It was equally clear that it was expedient to make a separate study of these two sets of causes; and as it was, of course, impossible to separate them in the treatment of samples of ores, a systematic investigation was laid out, involving the use of simple artificial products of known composition, so as to determine the various complicated elements of the problem.

In the long, involved and difficult investigation which followed, and which has occupied all my leisure time since 1892, I have been greatly aided by my assistant, Mr. E. A. Hersam, for whose intelligent skill and faithful devotion to the work I wish to express my warm appreciation.

The great complexity of the chemistry of the cyanides, the lack of accurate information in the text books, and the consequent erroneous statements in many of the publications on the cyanide process, have greatly added to the difficulties of the study. It became necessary to test *de novo* almost every step of the ground, so that an investigation which I had hoped to finish in a couple of years has already taken twice that time, and is now only fairly begun. Nevertheless, some of the results already obtained are so important that I have decided to condense in this paper an outline of many closely written pages of experimental notes on this subject. I hope to find time hereafter for a complete outline of the details.

In this discussion I propose to confine myself to two main points: How does gold dissolve in cyanide solutions? and, How is it precipitated from them?

I.—THE SOLUTION OF GOLD IN CYANIDE SOLUTIONS.

1. *The Solution of Metallic Gold in Potassium Cyanide.*

The solubility of gold in cyanide of potassium solutions has been known for over fifty years. Soon after its discovery by Elkington, Faraday and Bagration it was investigated by Ellsner,† who stated that he had found that while zinc would dissolve in a potassium cyanide solution with the evolution of hydrogen, gold and silver dissolved in such a solution only in the presence of oxygen. Although not enunciated by him in this form, the following reaction expressing these facts is usually known as the Ellsner reaction:

$$4KCy+2Au+O+H_2O=2AuKCy_2+2KHO.$$

The necessity for the presence of oxygen when gold dissolves in cyanide solution has been denied by Mr. J. S. MacArthur, who claims the honor of the invention of the cyanide process. In his article on "The MacArthur-Forrest Process of Gold Extraction," read before the Society of Chemical Industry, March 31, 1890, and reprinted a .d circulated by the "Gold and Silver Extraction Company of America," Mr. MacArthur says:

"Not having seen the original account of Ellsner's researches, I am not in a position to criticize his experiments, but I never could find that the presence of oxygen was necessary either to dissolve gold by itself or from ores by cyanide."

He cites no proof of his opinion regarding the action on metallic gold, but confines himself to speculation, as follows:

"If a piece of gold be immersed in a cyanide solution, so that air, to act on it, would have to penetrate two or three inches of the solution, the gold will dissolve in its usually slow and steady fashion. The equation shows that either oxygen must be absorbed or hydrogen evolved. I have seen no evidence of the former, and can adduce no proof of the latter; but I think the latter more probable, because I cannot conceive oxygen penetrating even a film of cyanide solution without oxidizing the cyanide to cyanate, whereas, in the other case, as suggested to me by my friend, Mr. Ellis, the nascent hydrogen may be at once seized by the excess of cyanide present and ammoniacal compounds formed."

Unfortunately for this ingenious speculation, it does not seem to be borne out by the facts. McLaurin‡ has shown by a very able research:

(1) That oxygen is necessary for the solution of gold in potassium cyanide solutions, and that it combines, quantitatively, according to Ellsner's reaction.

(2) That the rate of the solubility of gold in potassium cyanide solutions passes through a maximum in passing from concentrated to dilute solutions.

(3) That this remarkable variation is explained by the fact, which he also proves, that the solubility of oxygen in cyanide solutions decreases with the concentration of the latter.

But, to continue with our quotation from Mr. MacArthur, he says:

"However, we do not concern ourselves with the reactions of pure gold; but, as a matter of fact, we cannot find that oxygen plays any part in the cyanide extraction of gold from ores. We have treated an ore with cyanide with free access of air, and then a parallel experiment was done with boiled water, the bottle filled to the stopper with the solution and ore and the stopper sealed. The extraction was the same in both cases."

It will be seen that nothing is said as to the composition of the ore, so that the experiment is not decisive.

While McLaurin's experiments seemed conclusive, still the difference of opinion between Ellsner and McLaurin on the one hand, and the reputed discoverer of the cyanide process on the other, was so fundamental that it seemed worthy of further investigation. The importance of this fundamental reaction is not merely scientific, it is of the greatest practical importance in the application of the process.

Hence, this was one of the first points to which I turned my attention. The result of my investigation was an entire confirmation of the accuracy of the Ellsner reaction. That is, repeated experiments indicated that a solution of pure cyanide of potassium in pure water, from which all other substances are excluded, is entirely without action on metallic gold. Under favorable circumstances, such a solution absorbs oxygen from the air (without, as MacArthur assumed, immediately oxidizing the cyanide to cyanate), and the affinity of the potassium for oxygen and water, combined with the affinity of the cyanogen for gold and cyanide of potassium, leads to the formation of caustic potash and potassium aurocyanide, as per Ellsner's reaction. When the air present is limited, the reaction stops when the oxygen of the air is exhausted, and begins again when it is supplied.

(*To be Continued.*)

A Colorado Comparison Between Cripple Creek and the Comstock.

Looking backward it is hard to realize that the Comstock, that great silver lode of Nevada that in twenty-one years of operation produced between the surface and the great depth of 3300 feet more than $300,000,000, could have at any time in its history been looked upon with suspicion; or that, until the end of its bonanza career, when the ingenuity of man failed to mine it any deeper, any doubt should have been entertained over its future. When the mining man and the investor speak of the unequaled record of that great lode they forget that, through a season lasting eight years, there were few of the first class to raise a voice in defense of the worked-out mines, or fewer still of the investing class to take advantage of the season of depression and prepare for the greater fortune that followed the hard-luck season on the big lode.

The few of each class who stood by the Comstock in its season of depression, kept faith in its future greatness and backed that faith with money and labor, are the men whose names are now erroneously associated in the public mind with the discovery and location of the lode. The investor class is represented by William Sharon and his associates in the Bank of California; the mining class by Mackay, Fair, Flood and O'Brien. These men, whose enormous fortunes are credited to them by the public as a good stroke of luck, are the ones who came to the relief of the Comstock in its days of adversity.

When the original companies that became possessed of the Comstock from the locators and mined it for the first five years following began to go to smash as the result of extravagant management, the Bank of California was on hand to loan money on the properties and mills and buy them in when the surface pockets were exhausted and the companies forced to the wall. Previous to the arrival of Sharon in Virginia City, the Comstock boom had cost the public many millions of dollars lost in the purchase of shares in mining companies that never paid a dividend. The history of mining holds no record to parallel the extravagant follies of the period between 1859 and 1864—the first flush days of the Nevada bonanza. Ten mines that never paid a dividend cost more than $17,000,000 to exploit, and the total selling price of the lode was at one time above $700,000,000. Ten companies expended more than $17,000,000 in exploiting Comstock territory without returning a dollar, and shares of such companies were selling at enormous prices, while assessments were being levied regularly.

The cash ledger of the Comstock shows the total production during its twenty-one years to have been $306,000,000, its dividends and profits $118,000,000, with the assessments of its several companies aggregating the enormous sum of $62,000,000. They are immense figures, to be sure, but the actual profit of $56,000,000 does not appear so favorable as it might be against the total cost of $250,000,000.

The average annual yield of the Comstock during its first twelve years, or from 1859 to 1871, was but $12,000,000, or a total of $145,000,000; but the fluctuation was from $18,000,000 in prosperous times to as low as $2,000,000 a year when the lode was at its worst stage, then up again to $25,000,000 a year. Had the Comstock been deserted to its fate at the close of 1871 it would have left a heavy account with the public unsettled. Mackay and Fair, hard-working miners, backed by Flood and O'Brien, turned the tide in the Comstock's fortunes in 1872, when they opened up the big bonanza pocket in the Consolidated Virginia that produced in all about $105,000,000 and paid dividends of about $75,000,000.

And to find this pocket of ore they sunk a shaft 1167 feet in barren ground; to mine it they sunk below 3000 feet in depth.

These figures are of interest at this time, because Colorado has a mining camp that has had in some ways a parallel history to that of the Comstock, and because one conservative mining man has predicted that in a period of time corresponding with the life of the Comstock, Cripple Creek will produce $500,000,000 in gold.

Cripple Creek awakened a new interest in mining stock speculation and has had an era not similar to that of the San Francisco Stock Exchange in the early '60s, but compared to it on about the scale of a 40-cent Cripple Creek stock compared with a Comstock one selling at $1525 a share. But with the difference that there has never been a greater shrinkage than 50 per cent in a Cripple Creek stock, while it was not unusual for Comstock shares to fall from $1525 to $1.50 in a season. If the public will speculate, it must expect stocks to rise and fall; but Cripple Creek stocks offer no such speculation as did these assessment shares of non-dividend companies on the Comstock. There have been advances in Cripple Creeks as great as from 8 cents to $2 almost in a year, but no backward movements at even such rates as this. When a Cripple Creek stock gets to $2, there is reason for it being there and it usually camps about that figure unless some untoward accident in the property permits the skillful broker to get a temporary advantage of the market and force

it down to $1 25. Evidently the public has learned more about the mining business and the stock exchange than it did in Comstock days, but it is a question if the right attitude is not to be found between the over-enthusiasm of that era and the over-conservatism of the present day.

The Comstock cost too much. The world paid too dearly for what it got. Cripple Creek, with its cost of $7,000,000, against its credit of $23,000,000, makes much the better showing and has been a better investment. Its $23,000,000 production looks meager beside the $396,000,000 of the Comstock, but it is five years against twenty-one, and the Comstock's really bonanza days only commenced when it was thirteen years old. The Comstock had uncounted millions to assist in its development. There must have been "money to burn," since it is stated the Ophir had taken out $15,000,000 and only paid $1,400,000 in dividends. Only the most reckless disregard for money could have resulted in such a showing, and it would be interesting to know what in this day of mining would be done to the directors of a Cripple Creek company that did not pay out as dividends at least half the receipts from ore. Cripple Creek has had to pay its own way and in most cases profits at the time the mine was in the development stage. The 1167-shaft on the Consolidated Virginia, with the attendant dead work done to hunt for ore, cost $212,000 and was raised by assessments on the stock. The men who paid the assessments are the men who are now thought of when the "Big Four" mining kings of America are mentioned. It is when the search for a parallel with this kind of thing in Cripple Creek is commenced the difference between the two camps becomes so great there is no parallel at all. On the Comstock the Overman Company alone expended $3,162,800, levied from stockholders on assessments. In Cripple Creek work usually stops and the workers turn tail if as much as $1000 has been expended without results. A very few tunnel enterprises contemplating the expenditure of from $50,000 to $100,000 have been started, and there is one shaft, the Granite, that cost probably $25,000 before it began to produce at 600 feet. The Dead Pine has been another case of assessments without returns until its debit was well into the thousands, and about $15,000 was expended on the Gold Coin before it began to pay, but these few instances only emphasize the difference.

No bonanza chute to compare with the one that made the fortunes of the Big Four has yet been opened in Cripple Creek, neither is there a shaft 1167 feet deep. There are chutes here that have been followed from the surface down 600 feet into the ground, and that run so many hundred feet on the vein and so many feet wide, and produce ore worth so many dollars a ton, that if the facts were given in feet and ounces there would be a newspaper correspondent shut out from further following their fortunes; and there is one such chute that has made several men millionaires and others that have made many other men independently rich, and all that in two or three years, against the twenty-one years of the Comstock.

It may seem ridiculous to the public to offer a comparison between the Comstock of silver and the Cripple Creek of gold. The public takes note of nothing but records, and with the $306,000,000 and the twenty-one-year record of the one it is easy to laugh at the $23,000,000 and five-year record of the other. It is for the public to look backward, but the individual who sees ahead is the one the public look back upon with admiration in later years. And who shall say that sixteen years from now there will not be such individuals to be called the lucky dogs of Cripple Creek?

In every way Cripple Creek has stood the test that allows the comparison to be made. Its ore bodies are more diversified; where the Comstock had one lode Cripple Creek has thousands of veins, and where the Comstock had its rich pockets and great bonanzas reaching down to 3300 feet Cripple Creek has its hundreds of ore chutes that have improved steadily down to the deepest point they have been mined, and the disclosures along that present mining level, which is about the water line, have been so surprising in every case that the miner knows not what riches to expect when the season of pump installing and preparation forced by the new condition brought by the water shall have come to an end and the shafts gone as far below the water line as they now are above. If man could mine the Comstock to 3300 feet in the face of heavy solfataric action that raised the temperature in the lower levels to 114°, and all the enormous expense of pumping air into them could not reduce the heat below that, it will surely be possible to go yet deeper in Cripple Creek, where no such action interferes.

That the time will come when the Cripple Creek shafts will go to even greater depths in search of ore seems reasonable to expect. Every fear advanced by the mining experts has been removed, and every objection against the ores continuing to the farthest depths disproven by the actual development. The veins have persistently improved, passed through the overlying cap of eruptive rock down into the granite and the ore chutes solidified, enlarged and increased in value with each change encountered. The water level but enriched the ores and failed to bring the promised alteration to base and refractory sulphides of low grade. Once the knowing ones talked of surface deposits and "catch-as-catch-can" veins, but they have been rebuked by the proof of the developments. The ore deposits have withstood every test, and each year added a few millions over the output of the one preceding.

With the shafts now in water going down steadily into richer and yet richer ore, and in wider and yet wider bodies, and with the surface workers finding day by day new places to start new shafts, with more than 200 shafts already under production and more coming in as fast as men can find money to work with and secure ground to work in, with the greatest depth in the district 850 feet and but five shafts over 700 feet, every one of these exemplifying the same law of improvement with depth and richer ore below the water line, the mining man who has ambitions to be known as a prophet among his kind will at least take the safe side by granting the possibility of Cripple Creek in time equaling the ever world-famed silver bonanza of Nevada.

In Comstock days the mining world went mad, lured by the rapidity with which men made fortunes, then mad again over the rapidity with which fortunes were lost. Probably the mistake is in calling that wild furore of speculation business at all. In these days, at Cripple Creek, mining is the most conservative business, and few will risk more than a few thousand dollars in the venture for a fortune. It is only in this that Cripple Creek becomes the antithesis of the Comstock—in the business handling and in the contents of the ore. It was the Comstock's silver riches that set Colorado miners hunting for silver, and in its reflected light it was forgotten that gold could be mined to a profit. Now it becomes Cripple Creek's part to reverse the reflection and prove that gold mining in Colorado is equally as profitable by becoming the golden Comstock of the mining world.—Denver Republican.

On page 498 will be found some editorial comment on the above.

The Mineral Deposits of Eastern California.

NUMBER II.—*Concluded.*

Written by HAROLD W. FAIRBANKS.

The silver-lead mines of Cerro Gordo, situated near the summit of the Inyo range, have produced several million dollars. The Union mine was opened to a depth of 900 feet, when the ore body was lost. The inclosing rock is limestone of Carboniferous age. Bunches of very rich gold ore were occasionally found in this mine. Quartz occurs in some of the deposits about Cerro Gordo. When this gangue is present the lead content is less important, being replaced by iron and copper sulphides.

Silver-Bearing Sulphides of Copper, Antimony and Arsenic.—These minerals are found in well-defined veins, seemingly without regard to the character of the formation. Over much of the area in question they are frequently associated with gold-bearing quartz veins, the value of the contained gold sometimes equalling or exceeding that of the silver.

Pyritiferous Mineralization of the Rocks of Eastern California.—A most striking feature of this region is the wide distribution of iron pyrites, its presence being recognized at a distance of many miles by the red stains on the rock faces of the mountains.

No detailed study has been given to the question of the origin of the iron pyrites. To the writer it seems that it must be of secondary origin and that it is related to the widely disseminated deposits of the precious metals. Its presence in the ancient acid eruptives, as well as in the most of the varieties of the sedimentary rocks, would seem opposed to the view of its primary nature. On the contrary, its distribution through large areas of massive rocks, as well as the fact that in its distribution it generally seems to be independent of known ore bodies, is rather difficult of explanation on the view of secondary origin.

Discussion and General Conclusions.—(*a*) *Gold Ores.* A description of the gold quartz veins of California has recently been given by Mr. Lindgren. The writer agrees with most of the conclusions reached in that paper, but in some respects they do not all apply to eastern California. For example, he states that "the gold quartz veins throughout the State of California are closely connected in extent with the above described metamorphic series and that the large granite areas are almost void of veins, though fissures and fractures are not absent from them." The granite areas of the region described contain the greater number of the gold-bearing quartz veins, and they are by no means insignificant in number or value. Lindgren also says: "It appears to be a fact that veins in grano-diorite contain more sulphurets than those in other rocks." This is fully borne out by the writer's observations. A statement of general application can be made to the effect that the veins in the granite contain but little free gold below a certain depth, dependent upon local conditions, where it is replaced by auriferous iron pyrites. The veins in other rocks often contain free gold. That the veins in all the different formations are of fissure origin is unquestionable; they are not segregated, nor in any case does the ore seem to have been leached from the walls. There can be no question also, at least as far as the gold ores are concerned, that the mineralogical character of the country rock is of no great importance, the influence exerted being more often dependent upon physical conditions. It is a fact of general application that certain districts in eastern California are characterized by gold, others by silver, without any marked dependence, except in the case of galena, on the character of the rocks in those districts—that is, gold and silver deposits do not generally occur indiscriminately side by side. This would imply a much greater dependence on the nature of the chemical action than upon the physical conditions existing or the precipitating power of the walls upon the mineral-bearing solutions.

A number of the gold mines in the granite have reached a depth of 700 feet without becoming poorer, while those of Bodie have been opened to 1200 feet. It is only in the latter that the veins have been found to give out, becoming weaker below the 500-foot level.

The occurrence of gold in galena is rather remarkable, as well as that of its dissemination in the granite northeast of Mojave.

It is probable that the gold deposits of eastern California, with the exception of Bodie, are of the same age as those of the rest of the State, posterior to the upheaval terminating the Jurassic.

Mr. Lindgren expresses the following view in regard to the formation of the gold quartz veins of California: "Replacement proper of the minerals of the country rock along the fissure by quartz I have never been able to observe, and cases supposed to be of such nature have always proved to be due to the shattering of the country rock and the filling of it with silica along narrow cracks. The clean quartz usually forming the vein I cannot account for in any other way than by filling of cavities, as it does not seem possible that a replacement of the ferro-magnesian silicates and other minerals could occur without leaving chloritic stains or other signs in the resulting mass." It seems to the writer that the evidences are opposed to Mr. Lindgren's views of the presence generally of open fissures, during the formation of the quartz. Veins which are known to have been formed in open fissures almost invariably show a more or less pronounced banded structure, caused by successive additions through a long course of time during which the conditions did not remain absolutely uniform. In an open fissure the deposition cannot be conceived as having taken place except from the wall inward, leaving frequently a cavity in the center.

In many districts the quartz veins are quite localized. On the theory that the lenses of quartz along a vein are due either to an opening of the wall or to movements bringing two concave portions opposite, it cannot be conceived why quartz veins are frequently of so limited extent longitudinally.

Faulting is a very common phenomenon in disturbed regions, but quartz veins or mineral deposits of any kind occur only here and there, so that it would seem that, in addition to the formation of fissures, there must accompany it in the local centers of deposition more or less removal of crushed rock.

It can hardly be disputed that the large bodies of manganese, chrome iron and quicksilver in the Coast Ranges, as well as the galena ores of eastern California, have been formed by replacement.

In this discussion the writer does not wish to be understood as arguing that open fissures have not at times played an important part in mineral deposition, but that there are many reasons against that view of the origin of the most gold of the quartz veins, as well as the other mineral deposits of California.

(*b*) *Silver Deposits.* Silver-bearing galena is more often found associated with limestone in irregular chamber-like deposits along mineralized zones. Exceptionally, it occurs in other sedimentary rocks and in granite, in the latter case forming well-defined veins. Calcite and iron oxides form much of the gangue.

Enargite is found only in the Tertiary lavas and more ancient rocks of Alpine county.

Tetrahedrite, bornite, chalcocite, chalcopyrite and stromeyerite occur characteristically in well-defined veins with quartz gangue and in many different formations. It has not been demonstrated that the silver ores are superficial. In the Modock mines the best ore is said to have been obtained at a depth of 1150 feet. The great body of ore at Cerro Gordo has apparently been worked out, but the exploration is said not to have been thorough.

CANADA'S best known mines are those of British Columbia, on account of their rapid development and the large output. But much lively interest is being taken in the mines farther east, particularly in the Rainy Lake and Manitou districts in Ontario and Nova Scotia. From Nova Scotia mines which have been worked for many years the output has been considerable. From the Goldenville district alone over $2,000,000 has been produced. In the early eighties the district was practically deserted because the ore was supposed to have decreased in value, but they were really getting into refractory ores which they did not understand. During the past year two 10-stamp mills have been started up on large veins of good ore and a large number of mines are being exploited. American capital has been put into several of the properties.

Nevada City District Geology.

NUMBER II.

Later History.—At the beginning of the Neocene period the Sierra Nevada formed a mountain range of substantially the same outlines as that of to-day, but of much less height, the summits—located along the same lines as the present ones—having an elevation probably of about 5000 feet, in latitude 38°-39°. The range had been above water since the end of the Juratrias period, and in its lower part long-continued erosion had reduced it to a hilly, undulating country, frequently broken by high ridges and isolated peaks. A drainage system somewhat similar to the one of the present day had been developed, and auriferous gravels accumulated along the streams from the debris of the numerous quartz veins. The stream receiving the drainage of Grass Valley and Nevada City corresponded closely to the Yuba river, but also embraced the watershed of the upper Bear river. Its southern branch came down from Dutch Flat and You Bet with a northerly direction, crossing Deer creek at Scotts Flat and the South Yuba at Blue Tent; then turned westward and flowed down to the great valley by Badger Hill, North San Juan, French Corral and Smartsville. During the latter part of the Neocene period (the Pliocene) volcanic eruptions began near the summit of the Sierra, and masses of volcanic material began to pour down the river channels. The first material erupted was the light-colored, siliceous rock called rhyolite, which was of comparatively small volume, confining itself as a rule to the river channels. The eruptions consisted only to a small extent of molten material, the larger quantity poured out forming volcanic muds, which easily found their way down to the foot of the range. On the lower slopes they became mixed with more or less gravel and sand, and their eruptive character is now less apparent. Very heavy flows of this kind found their way down the old South Fork of the Yuba, and part of them flooded a low divide and filled the Nevada City basin. After a short interval, during which considerable erosion took place, the so-called "cement channels," or "channels of the volcanic period," were formed in certain parts of the Sierra, wherever erosion cut through the rhyolitic flows. No such channels have been found in the district here described. Then the period of andesitic eruptions began, and mud flows again poured down from the vents near the divide, at first as dark-colored, fine tuffs and sands, later as a gray or brown tuffaceous breccia, containing, in the foothills as well as in the high range, larger, more or less angular boulders of the dark-colored porphyritic rock called andesite. These last flows, coming down in rapid succession, flooded everything and covered up the middle slopes to such an extent that only isolated ridges and peaks protruded above them. The whole area here considered was thus once a gently sloping lava field, above which only Banner and Osborne hills protruded. The rough, high diabase ridges of the foothills also rose above the flows. The last of the andesitic flows is supposed to mark the close of the Neocene period. During the volcanic epoch the Sierra Nevada was subjected to a tilting uplift, which at the summit probably amounted to several thousand feet, and the streams at once began the work of cutting into this desolate lava plateau. The directions they took were more generally transverse than formerly. Their similarity to the old drainage was caused by the high, protruding ridges of bedrock, which in many places confined the new river to the old valley. This work of canyon-cutting has been continued with ceaseless energy until the present time. Not only has much of the enormous lava masses been washed away, but, owing to the uplift, the rivers have cut down far below the old Neocene bedrock surface and created the characteristic features of the Sierra Nevada of to-day; these are deep, abrupt canyons separated by broad or narrow ridges of more gently undulating surface.

In the district described in this folio the sloping ridges—Harmony ridge and the Banner Hill–Towntalk ridge—are the only remnants of the lava sheet which once covered nearly the whole region, while the present watercourses, here wholly unlike their Neocene predecessors, are sunk several hundred feet below the Neocene surface. Between the close of the andesitic eruptions and the present day occurred the extensive glaciation of the high Sierra, but the glaciers terminated about thirty miles above Nevada City; and it may be stated with certainty that neither in the Neocene nor in the Pleistocene period have any ice streams extended as far down as the latter place.

(To be Continued.)

Scientific Progress.

The Roentgen Ray Cure for Blindness.

This is surely an age not alone of marvelous inventions in the arts and sciences, but it is also an age of fads, fakes and unbounding faith. There never was a time in the history of the world when people more readily yielded themselves as victims to medical charlatans and quacks than at the present time. On the other hand, there never was a time when such tremendous efforts were made to educate the general public in questions of science and medicine. Commencing with the grammar school up through all grades of our public schools, anatomy, physiology, chemistry and physics are taught in more or less of a rudimentary way. Every monthly journal, every daily and weekly paper has a department devoted to these subjects. Special scientific journals having a wide circulation among the reading public discuss medical questions in every number. Lecturers with stereopticon travel about the country presumably to amuse, and incidentally to instruct their hearers on familiar topics. Almost every family has a book with some such title as "The Family Doctor," "The Family Saddle Bags," "The Family Medicine Chest," etc. Yet, with all these attempts to give instruction, the public are just about as ignorant as ever on the things of which they ought to have some degree of intelligence, and more than ever credulous and ready to accept every tale of marvel which they read in the daily press. The greater the improbability the more readily do the gullible public seize and gloat upon it.

For example, let us consider the latest fad, the X ray cure for blindness. This fad has received its impetus only through the statement of Edison, that within three years the blind, those whose optic nerve is not destroyed, will be able to see. The hopes of many thousands of unfortunate blind, that they may be made to see, have suddenly been raised to a high pitch. Every newspaper in this country has exploited this statement in startling headlines.

Since we know that the eyeball is, like bone, opaque to the X ray, and as the retina in health is unable to perceive any sensation of light from the rays before it has been made visible by fluorescence, we should hardly expect an optic nerve wholly or partially atrophied to respond to an excitation too weak for the normal eye to perceive. To restore vision to a blind eye by exposure to these X rays there must be some action which will cause a regeneration of the atrophied fibres or dissolve opacities lying between the nerve and the anterior surface of the eye. Electricity applied to even a sightless eye may cause flashes to be seen, but the sensations are purely subjective, exactly as the sensations of light which sometimes occur in a person who has lost both eyes by enucleation. This whole business is a delusion and a snare. Mr. Edison has made a serious mistake in permitting his name to be used, as he has to foster hopes which can never be realized. Until he has submitted positive proof in place of the bald assertion that the X rays possess curative powers in any degree, he should be silent on the subject. It must be borne in mind that there is not a particle of difference, as far as the perception of light by the retina is concerned, between the vibrations which come to it from the fluorescent screen or those of any other illuminating point of like intensity having the same wave lengths.

Instead of the X rays having curative power, there seems to be, on the contrary, an impression that these waves may produce harmful results. The way we run after fads at the present day would almost warrant us in accepting Nordau's views on degeneration. However, we have hopes that a time will come when we shall turn over to experts all new discoveries, or alleged discoveries, of sure cures for diseases for thorough examination and trial. We may have to wait until such time as faith in the power of the forked stick to point out the hidden veins of water and mineral give place to scientific methods, but it is bound to come in the fullness of time. —Pacific Medical Journal.

To Detect Foul Air.

It is generally believed that when the atmosphere of a room is impure the fact will be sufficiently noticeable to a person of normal sensitiveness without the aid of an instrument to inform him of the fact. That this is not so, however, is evident to any one who remembers how the suffocating odors of an overcrowded meeting room impress their disagreeable presence on a person coming in from the pure outside air, while, to all appearances, the persons in the room are quite unaware of the air being bad.

To remedy this state of things and show just how bad or otherwise the atmosphere of a room is, a clever inventor has just completed an instrument which shows the exact condition of the air. It consists of an airtight glass receptacle, in which is placed a red liquid. A bent glass tube is inserted into the fluid, and up this tube the fluid runs, to drop at the rate of one drop in two minutes onto a cord that is stretched by a weight. This fluid possesses the property of changing color when submitted to the action of carbonic acid gas. The more of this gas there is in the air the more pronounced the change in the color of the fluid.

With this fact in mind the principle on which the indicator works is easily understood. The drops of fluid, as they fall on the string, change it, according to the condition of the atmosphere.

Should the atmosphere be perfectly pure, the string remains red all the way down. Should it be slightly tainted, the top of the string appears white. The fouler the air the longer the white mark on the string. By the side of the string runs an indicator, graded to show the exact condition of the air. The highest point on the scale marks "pure," the next "passably pure," the next "bad," and from there down to "very bad" and "extremely bad."

The instrument has been thoroughly tested and found to work perfectly.

A CORRESPONDENT of London *Engineering*, to show that the metre is not a measure for the standard, says: "The metre was originally fixed without reference to practical considerations of convenience and utility, but simply as a theoretical fancy, to adopt the 100,000th part of a degree of latitude as the standard measure, with the idea of basing the measure on the earth itself, irrespective of any minor consideration of utility. Unfortunately this was subsequently upset by more correct measurements of the earth, showing that the metre was not really the 100,000th part as intended; and it has now consequently to be referred to an authorized standard metallic measure, like other standard measures."

Electrical Progress.

Copper Refining by Electricity.

There is but little to be said about copper refining or the electrolytic extraction of the metal from its ores. A great deal has been published about refining, and still more about various schemes for extraction, and there would be little use in repeating such accounts here. At the same time, there is a great deal that is not published. Copper refiners seem to think they are working a magic secret process, and that, if they keep all the details to themselves, no others will be able to compete with them. Such ideas are commonly to be found among workmen, but are seldom encountered among educated people; and the probability is that some copper refiners are working their processes as badly as they can be worked, and understand very little about electrolytic work. The unfathomable secret guarded by copper refiners seems to be the use of anodes and cathodes of copper in a solution of copper sulphate. As regards details of management or of processes, such as the best temperature to work at, or the best method of circulating the liquid, there can be very little to learn. It would be much better, says Jas. Swinburne, for electrolytic copper refiners to publish results and compare notes, as if they are competing with one another any knowledge shared equally among them makes no difference, but it puts them all in a better position as competitors in the race with refiners who use ordinary metallurgical methods.

The main difference between the two classes of copper refining processes consists in the series or parallel coupling of the plates. From a purely electrical point of view, this looks like a distinction without a difference, but there is more in it than appears at first sight. It makes little difference in the energy used per ton of copper refined, the only source of divergence being the numerous contacts in the parallel system. When a vat only takes a fraction of a volt, a large proportion of the power may be wasted on imperfect contacts.

The series arrangement, however, saves a good deal of money in the leads and greatly simplifies the connections. It is often supposed to have some magic efficacy in giving a greater output of copper for a given power, but that is absurd. Its great advantage really lies in its needing less copper in the vats for a given output. This may seem a small matter, but if prices are worked out it may mean a very important saving. Take an example: Suppose copper is deposited at, say, five amperes per square foot; and suppose the anodes are cast, say, ¾-inch thick, and are eaten off both sides. Roughly, the anodes will take two months to be deposited on the cathodes. Take the case of a refinery dealing with a thousand tons of copper per month. This means that 2000 tons are in the vats. As a matter of fact, there will be a little more, but we can take 2000 tons as a good round figure. The value of this copper, at $300 per ton, is $520,000. Now the question is: what value is capital to the owners of the refinery? The interest on the copper in the vats is, say, $35,200 a year, or $3000 a month. As the output is 1000 tons a month, this means that the price of refining copper is increased no less than $3 a ton for interest on the metal in the vats. It is then of great importance to keep down the amount of copper going through the works—that is to say, to make it go through quicker. A little can be done by removing the cathodes when they are ⅝-inch thick, instead of ¾-inch, and putting in new ones. This reduces the $3, not to $1.50, but to something above $2.25; how much above $2.25 depends on the cost of the initial cathodes. Many people may say there are such quantities of copper all about a copper refinery that it makes no real difference whether it is in the vats or in the stores. The copper in the vats cannot act in either way, and is quite independent of the stocks held, and it cannot be drawn upon. It therefore

represents capital lying idle. It is still an open question whether the series arrangement, as series arrangement, saves money. At the Bridgeport works, in Connecticut, the system worked out by Hayden is used. The anodes are rolled and are quite thin. The dimensions are about ¼-inch arranged in wooden vats taking something like 120 volts, connection being made to one at one end and to a special cathode at the other. Each of the intermediate plates then becomes both cathode and anode, as one side of it is eaten away while the other has copper deposited on it. As the plates are rolled they are eaten and deposited very evenly, and the process is carried on till very nearly the whole of the copper is transferred. As the deposited copper never sticks tight to the plates, the remains of the original anodes can be picked off the refined copper. There is, of course, a certain amount of scrap anode which has to be remelted and rolled again, but as no leads have to be connected to the anodes, and as they are finally supported by the deposited copper, they can be consumed much more completely than in the case of thick cast anodes. The saving is thus essentially in the use of thinner plates and in the cost of doing away with the necessity for making electrical connection to each plate with its attendant loss of power due to inferior contacts. The saving in leads about the vat house is also considerable. The most important of these points is undoubtedly the thinness of the plates in the vats. There seems no reason, however, why equally thin plates should not be used in the parallel system. There is no reason why the parallel system should be tied down to cast anodes, which must be fairly thick to allow of casting. It might be possible to cast the anodes thinner by adding a little extra silver. The series arrangement has been worked out, no doubt independently, by Smith, Hayden and Stalmann. Cuprous chloride gives twice as much copper as cupric sulphate with a given current; but that is not everything, and unless the resistance of the vat is so low that twice the pressure is not necessary, this does not pay. It might be said that a specially low current density might be used, but that means sunk capital again. "I do not know at all how far the chloride would do, as it might carry over impurities that remain in the slimes in a sulphate solution. Copper nitrate gives good deposits of copper with enormous current densities, but it is probable that silver and perhaps gold are carried over. Swan has made numerous experiments on rapid deposition from the nitrate, but has, I think, published nothing as to its use in refining argentiferous copper. The presence of very little chlorine might prevent silver coming over, but it would hardly stop gold."

Stalmann, who was for some time manager, and who designed the Anaconda electrolyting copper refining works, uses a very ingenious series arrangement. Each plate has paper stuck to one side. A few copper rivets are put through and the paper is blackleaded. This gives a paper cathode, which separates the deposited copper from the crude, and gives no trouble in separating the scrap anodes from the good deposited cathodes.

It is often supposed that everything electrolytic is pure. Unfortunately, this is not necessarily the case. Electrolytic copper is nearly pure, but it is generally, if not always, contaminated with antimony. It is probable this small trace of antimony does harm, as it most likely reduces the conductivity appreciably, and may alter the non-electrical physical properties of the metal. Antimony can be separated from copper by electrolytic analysis. What is wanted is a method which is possible on a commercial scale.

ONE of the largest electric plants in this country will soon be established at York Haven, Pa., at a cost of about $2,000,000 or $3,000,000, and will be about 20,000-horse power. It will distribute a current of electricity throughout the near-by towns, such as Harrisburg, Lancaster, York, Manchester, and all the towns within a radius of thirty or forty miles. It is said that the plant will be the means of the establishment of three or four large mills at York Haven. Early in the spring about 2000 men will be put on the works in order to hasten completion. It is thought that it will take about three years to complete the plant.

Mechanical Progress.

Metallic Carbides.

Among the many new fields of work opened up by the introduction of the electric furnace, according to *Nature*, is the preparation of difficultly reducible metals undertaken with success by M. Moissan. These reductions being necessarily effected by the presence of carbon, the formation of definite metallic carbides of great stability soon becomes apparent, the properties of which came to be of such interest that their preparation was systematically attempted. Certain metals, such as gold, bismuth, lead and tin, do not form carbides at the temperature of the electric furnace, neither do they dissolve any carbon. The metals of the platinum group dissolve carbon with facility and deposit the whole of it, on cooling, in the form of graphite, the metals being unchanged. Copper, silver and iron take up carbon in quantities which, although small, are sufficient to cause marked changes in the physical properties of the metals. It is noteworthy that no definite crystalline compound could be obtained with iron. On the other hand, fused aluminum takes up carbon readily in the formation of the crystalline carbide, Al_4C_3, and the oxides of many other metals furnish similar crystalline compounds when heated in an electric furnace with an excess of carbon. The behavior of these substances with water furnishes the most convenient mode of classification. The carbides of molybdenum, tungsten, titanium, zirconium, the latter having two, and of chromium, also having two, do not decompose water at the ordinary temperature. Of these reacting with water, the carbides of lithian, calcium, strontium and barium furnish a pure acetylene; of aluminum and beryllium, pure methane; of manganese, a mixture of equal volumes of hydrogen and lethane; while metals of the cerite group give crystalline carbides, all of which react with cold water, forming a complicated gaseous mixture containing hydrogen, acetylene, ethylene and methane. But the most complex reaction is that furnished by uranium carbide with water. In this case, in addition to the gaseous mixture containing methane, ethylene and hydrogen, liquid and solid hydrocarbons are produced in abundance. The carbides of silicon and titanium are extremely hard, the latter even cutting diamond.

Inaccurate Glass Gauge Readings.

In a pamphlet issued by the British Board of Trade, Mr. Macfarlane Gray, the chief examiner of engineers, mentions several instances where misleading gauge glass readings, due to defective connections, have been responsible for many casualities, especially in marine boilers. One case was that of a passenger steamer in which two of the furnace crowns were discovered to be down just as she was on the point of starting. A Board of Trade surveyor happened to have occasion to visit the steamer at the time, and the chief and second engineers, both certificated men, told him what had occurred and requested him to note that the gauge glass showed plenty of water in the boiler, and that therefore they were not at fault. Examination proved, however, that the cock on the communication to the steam space of the boiler was shut, this having been done for a survey on the previous day, and forgotten. On opening it the water disappeared out of the glass. The second engineer admitted that he had blown the boiler down to lower the water level, as it was above the top of the glass. Two furnaces were brought down in another steamer at sea owing to the top communication being shut. Other cases, and with more serious results, might be cited, all of them illustrating what serious damage may result from trifling causes which a little thoughtfulness would prevent.

THE New York and New Jersey Bridge Construction Companies have made a contract with the Union Bridge Company for the building of the bridge over the Hudson river at New York, at a cost not to exceed $25,000,000, the Union Bridge Company agreeing to give a bond of $1,000,000 for the faithful performance of the contract.

BRASS that is not subjected to heat may be kept from tarnishing by the application of a lacquer composed of one ounce of shellac dissolved in ¾ pint of alchohol. It may be colored with dragon's blood, saffron or tincture of tumeric.

Practical Information.

Nature as an Engineer.

How suggestive the vegetable kingdom is of engineering problems was pointed out in a very interesting manner some time ago by Sir Benjamin Baker in a presidential address to the British Institution of Civil Engineers. "Every tree," he remarked, "is a vegetable pumping engine, but hydraulic engineers would be sorely puzzled to explain how the large quantity of water required to supply the evaporation from the extended leaf service is raised heights up to 400 feet and above. We know that the source of energy must be the sun's rays, and we know further that, in the production of starch, the leaf stores up less than 1 per cent of the available energy, so that plenty remains for raising water. Experiments have shown that transpiration at the leaf establishes a draught upon the sap, and there is reason to believe that this pull is transmitted to the root by tensile stress. The idea of a rope of water sustaining a pull of perhaps 150 pounds per square inch may be repugnant to many engineers, but the tensile strength and extensibility of water and other fluids have been proved experimentally by Professor Osborne Reynolds, and by Professor Worthington and others. A liquid, deprived of air, entirely filling a glass vessel, when cooled, pulls on the vessel, and at last lets go with a violent click. Water has been so stretched nearly 1 per cent of its bulk, and the adhesion of the water to the sides of the vessel and the amount of the tensile strength were found to be quite equal to that of good mortar. With ethyl alcohol the modulus of elasticity, both in tension and compression, was constant up to the ultimate tensile resistance realized of 255 pounds per square inch. Many hydraulic engineers have, no doubt, lived and died without encountering anything in their experience suggesting that water and other fluids were capable of resisting a tensile stress of no insignificant amount; and yet, as long ago as 1663, the fact was known, for the secretary of the Royal Society then wrote to the Governor of Connecticut that 'what puzzleth and perplexith us is that water defecated from the air remains suspended and doth not at all subside after the receiver hath been exhausted of air;' and, in the same year, the president was asked 'to entertain his Majesty' Charles II. with the sight of quicksilver sustaining itself by tension at a height of 50 inches when the barometer was at 29 inches, 'something else but equipondency of air being,' it was truly said, 'necessary to explain this odd phenomenon.'"

THE largest canals are those of Russia, the system connecting St. Petersburg with the Caspian sea furnishing continuous navigation for 1434 miles. Then comes the Erie canal, from Albany to Buffalo, 381 miles; the Ohio canal, from Cleveland to Portsmouth, 317 miles; the Gotha canal from Stockholm to Gothenburg (Sweden), 280 miles; the Miami & Erie, from Cincinnati to Toledo, 274 miles; the Pennsylvania canal, 193 miles; that from Soonkelassa to Cuddapar, in India, 190 miles; the Chesapeake & Ohio, from Cumberland, Md., to Washington, 184 miles; that from Dublin to Ballinasloe, Ireland, 164 miles; the Delaware & Hudson, from Rondout, N. Y., to Honesdale, Pa., 111 miles; that from the Danube to the Main, 108 miles.

JOHN WOLFE BARRY, in his presidential address to the Institute of Civil Engineers of England, said that the commercial navy of the British Empire in 1837 consisted of 20,500 vessels, with a total tonnage of 2,333,000 tons, and consisted almost entirely of sailing ships, only 624 being returned as steamers, having in all a tonnage of 70,000 tons. At the present moment we have in our mercantile marine 36,000 vessels, with a total registered tonnage of 10,500,000 tons, while out of that total, which includes coasters, less than 4,000,000 tons are sailing vessels. This comparatively small amount of sailing tonnage is rapidly diminishing and that of steamers increasing, so that in the last ten years steam tonnage has increased in round numbers by 2,000,000 tons and sailing tonnage has diminished by 1,000,000 tons. Prior to 1851 there was no submarine cable across the Channel, none to the United States till 1858, nor to India, Australia or South Africa till 1865, 1872 and 1879, respectively. Nowadays the mileage of submarine cables is 162,000 miles, the capital employed in them is $40,000,000 and the total number of foreign and colonial telegrams is about $7,000,000 annually, without reckoning those that are sent by the submarine companies without the intervention of the postoffice.

THE Government of Mexico has recently made some important amendments in the patent law of the country, which affect Article 33 of Chapter V of the law of June 7, 1890, on patents of invention, and also the transient article of the law. Article 33, as amended, reads: "The owner of a patent of invention or a patent of improvement is compelled to prove before the department of Fomento, at the end of every five years of the existence of his patent, and in order to keep it in his possession for the following five years, that the payment of an additional tax has been entered into the Federal Treasury, as follows: At the end of the first five years, $50; at the end of ten years, $75; and at the end of fifteen years, $100. All these payments must be made in Mexican dollars. To prove that these payments have been made at the end of the said period of five years, a term of two months is allowed, which cannot be extended."

THERE is a general idea that lead shot are made spherical by falling from a height. The only purpose of lofty shot towers is to give the shot a chance to cool and harden as they tumble. They are just as perfect spheres when they start from the top as when they reach the well of water 200 feet or so below. The usefulness of the water is merely as a soft cushion to receive them. Shot cannot be made from pure lead, but an admixture of arsenic causes the lead to form globules, like mercury. The molten mixture is placed in a big iron saucepan with perforated bottom, and the drops falling through are the shot. They must fall some distance in order to get time to cool and harden. A batch thus made, they are scooped out of the water, tumbled about in a revolving barrel with plumbago, and finally put through a series of sieves, to sort them into sizes for market.

THE flags to be hoisted at one time in signalling at sea never exceed four. It is an interesting arithmetical fact that, with eighteen various colored flags, and never more than four at a time, no fewer than 78,642 signals can be given.

Professional Cards.

HERBERT LANG,
Mining and Smelting Engineer,
Albany Hotel, Oakland, Cal.

WADE & WADE,
Analytical Chemists and Assayers,
109½ Commercial St., Los Angeles, Cal.

D. B. HUNTLEY,
Mining Engineer and Metallurgist,
De Lamar, Owyhee Co., Idaho.

ALMARIN B. PAUL, M. E.,
ROOM 49, CROCKER BUILDING.
Cor. Market and Montgomery Sts., San Francisco.
Will act as AGENT for the sale of RELIABLE Mining Property. Principals desiring valuable quartz or gravel investments at reasonable prices will do well to see what I may have. Only legitimate mining properties handled.

W. J. ADAMS, E. M.,
PRACTICAL MINING ENGINEER.
Graduate of Columbia School of Mines. Expert on general mill work and amalgamation. Eighteen years' experience. Will report on Mines and Mills, and take full charge of Mining Properties. Address, 132 Market St., Room 15, San Francisco, Cal.

COBB & HESSELMEYER,
MECHANICAL ENGINEERS.
GENERAL MACHINERY.
HYDRAULICS, POWER, TESTS, ETC.
421 Market St., Cor. First St.,
Rooms 70 and 71.....San Francisco, Cal.

The Evans Assay Office.
W. N. JEHU, - - - - Proprietor.
Successor to Jehu & Ogden.
628 Montgomery Street, San Francisco.
Rooms 46 and 47 Montgomery Block.
Ore Assays, Analyses of Minerals, Metals and their Alloys, Etc.
LESSONS GIVEN IN ASSAYING.

School of Practical, Civil, Mechanical,
Electrical and Mining Engineering.
Surveying, Architecture, Drawing and Assaying.
723 Market St., San Francisco, Cal.
OPEN ALL YEAR.
A. VAN DER NAILLEN, President.
Assaying of Ores, $25; Bullion and Chlorination Assay, $25; Blowpipe Assay, $10. Full Course of Assaying, $50. Established 1864.
☞ Send for Circular.

F. H. HARVEY. W. S. HUTCHINSON.
HARVEY & HUTCHINSON,
GALT, CAL.,
Mining and Metallurgical Work in All Branches.
Assays, Chemical Analysis of Ores and experiments on rebellious ores for treatment by cyanide or other processes. Surveys and reports upon mining properties.

EDWARD C. BROADWELL,
Chemical Assayer.
2006 Champa St., Box 840, Denver, Colo.
Chemical assayer; no loss by fire test; truth only; gold, 75c; gold and silver, $1; gold, silver and platinum, $1.85; copper, lead, nickel, zinc, etc., according to difficulty of precise determination; tests for chlorination, cyanide or proper method of treatment.

Eveleth, MacLymont & Co.
MINING and CONSULTING
Engineers and Metallurgists.
Examine and report on mines, ore bodies, and all metallurgical processes connected therewith.
Practical mill tests, assays and analyses of ores and general analytical work undertaken at the
CALIFORNIA METALLURGICAL WORKS,
10 Annie St., (opposite Palace Hotel),
Between Market and Mission Sts.,
SAN FRANCISCO, CAL.
References to leading mining men on application.

CHARLES P. GRIMWOOD,
Mining Engineer and Metallurgist,
Laboratory, 214 Pine St., San Francisco.

RICHARD A. PARKER,
CONSULTING MINING ENGINEER.
Cable address: Richpark.
Crocker Building.....San Francisco, Cal.

MORGAN & CO.,
ASSAYERS, REFINERS & ORE TESTERS.
Guarantee reliable work.
261 Wilson Block.....Los Angeles.

JOHN H. MEANS, Geologist & Mining Engineer,
Preliminary reports on mines to determine advisability of extended investigation; assists upon large examinations. Intricate surveying, and geologic work for lawsuits. Thorough experience. Abundant references. Anglo-American code. Address, 1016 Pine St., S. F., Cal.

HENRY E. HIGHTON,
ATTORNEY and COUNSELLOR,
Rooms 36-39,
Fourth Floor.....Mills Building,
SAN FRANCISCO, CAL.
Established Thirty-Eight Years. Special Attention Paid to Mining Business.

PROFESSOR GEORGE DAVIDSON,
Late of U. S. Coast and Geodetic Survey.
Consulting Civil and Hydraulic Engineer.
GEORGE F. DAVIDSON,
Agent for Sale of Mines,
530 California Street, San Francisco, Cal.

Thomas B. Everett, M. E.
Twenty-six years practical experience in metal mining. Will make reports upon property, or furnish properties to purchasers, if desirous to invest in the Cripple Creek gold district, all on short notice.
References furnished in Denver or San Francisco. Branch office, Room 25, tenth floor, Mills Building, San Francisco, care S. K. Thornton, or THOMAS B. EVERETT, Box 195, Denver, Colo. Registered cable, Everett, Denver.

H. C. WOODROW,
Mgr. Santa Ana Gold Mining Co.
Examinations and Reports Made on Mines and Mining Claims.
Correspondence solicited.
ANGELS, CALAVERAS COUNTY, CAL.

LOUIS FALKENAU,
STATE ASSAY OFFICE,
434 California St., near Montgomery.
Analysis of Ores, Metals, Soils, Waters, Industrial Products, Foods, Medicines, etc., etc.
Court Experting in all branches of Chemical Technology. Working Tests of Ores and Investigation of Metallurgical and Manufacturing Processes. Consultations on all questions of applied chemistry. Instructions given in assaying and all branches of chemistry.

A. H. WARD. H. C. WARD.
C. A. LUCKHARDT & CO.,
Nevada Metallurgical Works.
ASSAYING, MILLING AND ANALYSIS OF ORES.
71 & 73 Stevenson St., San Francisco, Cal.

EDWARD L. HALLAWELL,
115 and 117 Main Street (2nd floor),
SAN FRANCISCO, CAL.
Millwright and Engineer.
Contractor for the erection of Stamp Mills, Roller Mills, Reduction Works, Saw Mills (both circular and band), Aerial Wire Rope and Surface Tramways, etc., etc. Putting in machinery, shafting, etc., of all kinds promptly attended to. Estimates given on plants, complete, including machinery, building material, etc.

Thomas Price & Son,
Assay Office, Sampling Works
And Chemical Laboratory.
524 Sacramento Street, San Francisco, Cal.

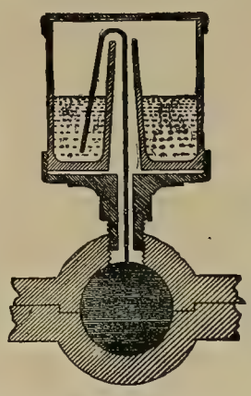
Positively Reduces Oil Bills 75 Per Cent.


THE FINCH OIL CUP.
Frictional vibration by the motion of the shaft against the point of the wire causes the oil to flow, and that this flow is not produced simply by syphonic or capillary action but by frictional vibration is proven by the fact that if the wire does not rest on the shaft then the oil will not flow. When the machinery stops the feed stops, therefore **the Finch Cup is Absolutely Automatic, Feeds Enough Oil and No More, Prevents All Waste, Needs Very Little Attention.**
Read One of the Many Testimonials:
UNION GAS ENGINE CO. SAN FRANCISCO, July 19, 1894.
During the past three years we have used your Cups for the crank shaft bearings of our engines, and also on all bearings of shaftings and tools in the shop. Our engines now *require no attention* except to fill the Cups occasionally, and therefore we can cheerfully recommend the Finch Cups to any one as *being the best in the market.*
K. J. McHUGH, 51 Fremont St., San Francisco, Cal.
General Agent for Pacific Coast. Send for Circular.

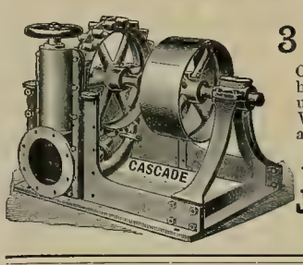
HORACE F. BROWN, CONSULTING ENGINEER.

Special attention given to preparing plans for the Chlorination and Bromine Processes of Treating Gold Ores.
PATENTEE { Brown's Complete Automatic Mill Process. Brown's System of Mechanically Stirred Roasting, Cooling and Conveying Furnaces. Etc.
1607-8 Manhattan Building, Chicago, Illinois.

The General Gold Extracting Co., Ltd.,
PELATAN-CLERICI PROCESS.
Patented in U. S. and Other Countries. Capital, £100,000.
London Head Office.....8 Drapers Gardens.
Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.
This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.
Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.
F. CLERICI, Manager for U. S.

KENDALL GOLD AND SILVER EXTRACTION CO.
THE KENDALL PROCESS is the most efficient method of using cyanide for the extraction of precious metals from their ores. Wherever this process has been adopted the result has been increased percentages of values recovered and saving of time. Material reduction in consumption of chemicals has also been demonstrated with respect to several classes of ores.
All ores, without exception, amenable to cyanide treatment can be treated to better advantage by the Kendall Process. This can be accepted as an axiom.
The manager of one of the largest mines in the Mercur District, Utah, wires: "We now begin to understand dioxide process; last twenty days treated 220 tons per day of $26.50 ore, average of all tailings samples $0.83."
Owners of mines and reduction works can obtain full information on application to
KENDALL GOLD AND SILVER EXTRACTION CO.....47 Broadway, New York City.

TURBINE AND CASCADE WATER WHEEL
Adapted to all Heads from
3 Feet to 2000 Feet.



Our experience of 33 YEARS building Water Wheels enables us to suit every requirement of Water Power Plants. We guarantee satisfaction.
Send for a Pamphlet of either Wheel and write full particulars.
JAMES LEFFEL & CO.
SPRINGFIELD, OHIO, U. S. A.

WEBER Gasoline Engine For use in any place or for any purpose requiring power. Only a few minutes' attention required each day. Guaranteed cost of operation is 1 cent per horse power per hour. The simplest, most economical and best power. Address WEBER GAS & GASOLINE ENGINE CO., 430 Southwest Boulevard, Kansas City, Mo.

Coast Industrial Notes.

—The Atchison, Topeka & Santa Fe Railway Co. intends to expend $1,500,000 between now and July 1st, '97.

—Colonel Overton of the Virginia City Water Works has estimated the cost of supplying Reno with pure water from Hunter creek at $74,000.

—A dividend (No. 22) of 25 cents per share has been declared on the capital stock of the Paraffine Paint Co., 116 Battery street, San Francisco, payable December 29.

—The Great Northern Railway Co. has completed preliminary arrangements for the construction of the Cascade tunnel in Washington. It will be two and one-half miles long.

—The entire property of the Seattle, Wash., Consolidated Street Railway Co., consisting of thirty-five miles of roadway, with rolling stock, power house, etc., has been sold under foreclosure for $130,001.

—The owners of the Brown's Valley irrigation ditch has asked the city council of Marysville to pass an ordinance giving them a franchise for bringing electric light and power to that city. It is proposed to supply the mines at Brown's Valley first and then run their lines on to Marysville.

—Exports of flour from San Francisco for the first eleven months of '96 amounted to 1,040,369 bbls., against 859,594 bbls. during the same period in '95, a total export of breadstuffs for the eleven months of 14,101,670 ctls., valued at $16,173,000, against 12,600,000 ctls., valued at $11,891,200, for the same period in '95.

—San Francisco exports of produce for the first eleven months of '96 are $38,123,800, against $30,120,400 for the same period last year, the largest for six years. Of this, exports to Great Britain were valued at $14,616,200, Hawaiian Islands $3,256,500, Australia $3,589,500, Central America $3,069,100, China $2,707,900 and Japan $1,985,400.

—The United States Supreme Court is engaged hearing arguments in the case involving the title to about 800,000 acres of land in southern California. This land was comprised in the original grant to the Atlantic & Pacific Railroad Co. made in 1896, and the dispute is between the United States Government and the Southern Pacific Railroad Co. This grant was forfeited by the failure of the Atlantic & Pacific to build its road within the specified time. The Southern Pacific claims the land on a junior claim.

—E. C. Potter of Chicago lately addressed a meeting in San Diego to consider the proposed steamship line from that place to Japan. Potter's plan is to organize a company with $5,000,000 capital stock, $3,000,000 of which shall be issued. In addition, $5,000,000 of ten-year bonds are to be issued to build four twenty-knot 8000-ton steamers, at a cost of about $6,500,000, the bonds to be secured by the steamers. Southern California is to be asked to contribute $500,000, to be paid when the balance of the $8,000,000 is actually in hand.

—The Oregon Railway Commission reports that not a road in the State has paid dividends for four years or more. Both the Oregon Railway and Navigation and the Southern Pacific show deficits. The latter road (Oregon and California, operated by the Southern Pacific under a thirty-four year lease) has a shortage of $766,028 this year. It was $607,975 short last year. The Oregon Railway and Navigation had a shortage, including rents and taxes, of $2,333,395 in 1894. The showing since is little over 4 per cent on the investment. In 1896 the gross earnings were $2,640,112 and operating expenses $1,621,713; income from operation $1,018,399. The Oregon Central and Eastern is in a bad way. Since the litigation in the courts, when $15,000,000 of capital invested in it was wiped out and the road stood absolutely valueless, there has been expended $100,000 for improvements and still there is not a cent in sight for the purchasers even on their first investment.

Commercial Paragraphs.

THE steamer Czarina, recently rebuilt by the Fulton Engineering and Shipbuilding Co., develops increased speed on her trip to the Beaver Hill Colliery.

THE Mine and Smelter Supply Co. of Denver, Col., has purchased the mining machinery stock of C. W. Badgley & Co. of that place, the latter retiring from business.

EDWARD L. HALLOWELL, millwright, of 115 and 117 Main street, San Francisco, has undertaken the erection of a sawmill with a capacity of 125,000 feet per day for the Sanger Lumber Company at Sanger, and has sent down L. A. Wheeler and M. M. Davidson to take charge of the work. It will be a double band mill, with most approved new appliances.

THE Colorado Iron Works Company of Denver have an order from the Mazapil Copper Company of Saltillo, Mexico, for three latest improved elliptical bowl slag trucks, and also for one double pot slag truck for the Compania Minera Fundidora y Afenadora al Monterey, Mexico. They have lately shipped a 6200-foot Finlayson patent wire rope tramway to the Noble Five Mining and Milling Company at Daudon, B. C.

H. F. BROWN of Chicago is in Congress, Arizona, to complete and put in operation the new Planet-Saturn mill, of the Brown automatic type, 75 tons daily capacity. The crushing is by Cornish rolls, reducing the ores to a 16-mesh size. This pulp is roasted, cooled and conveyed in Brown's combined roasting, cooling and conveying furnace, and charged to the cyanide tanks by Brown's automatic pulp distributor, there being no manual labor required from the time the ore is charged to the crusher until the tailings are sluiced out in the tanks. Mr. Brown will also put in operation one of his combined furnaces of 100 tons daily capacity for the Congress Gold Company about January 1st.

Recent California Mining Incorporations.

American Mining Company: W. Baker, H. C. Stillwell, H. Coffin, W. H. Linforth, G. E. Whitaker; capital stock $500,000—$125 subscribed.

Ashford Mining Company, San Francisco; T. Bull, Santa Clara; W. C. Andrews, San Jose; H. J., L. R. and H. Ashford, Randsburg; capital stock $200,000.

Crescent Vulcan Mining Company, San Francisco; E. J. Bates, M. and E. Savage, M. J. Brandenstein, E. S. Swann; capital stock $5000—all subscribed.

Juniper Gold Syndicate of California, San Francisco; P. G. Gow, J. C. Campbell, N. B. Frisbie, W. H. Metson, F. C. Drew; capital stock $800,000—$25 subscribed.

Recently Declared Mining Dividends.

Portland, Colorado, $30,000, payable Dec. 10.

Anchoria-Leland, Colorado, $6000, payable Dec. 10.

Idaho, British Columbia, $20,000, payable Sept. 22.

Ontario, Utah, $15,000, payable December 31st.

Bullion-Beck, Utah, $45,000, payable December 21st, a total of $1,947,000.

Mercur, Utah, $25,000, payable Dec. 15. This is a total to date of $575,000.

Personal.

HAMILTON SMITH sailed from New York for London last week.

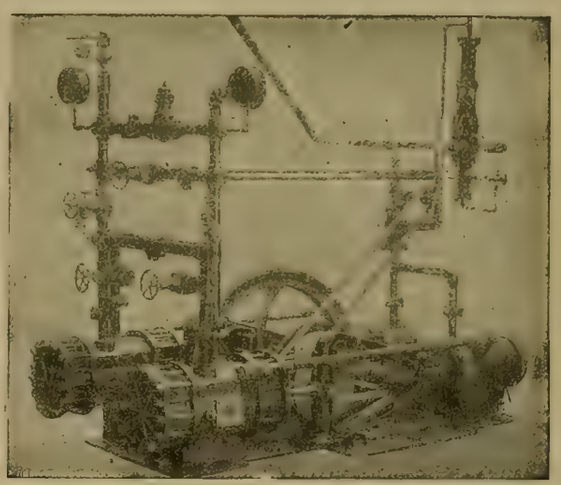
DOUBLE PIPE AIR COMPRESSOR.



This is a cut of the Double Pipe AirCompressor, the Compressor that is guaranteed to save 30% in power over any other make. It is cheapest to buy, cheapest to carry about and cheapest to run. If your fuel or water costs you anything, you want this Compressor. If you can get railroad freights free, and can carry machinery to your mine without cost, and your power costs you nothing, any make of Compressor will do you. You will be under no necessity to write to PNEUMATIC POWER CO., at 306 Pine St., San Francisco, Cal. We could save you money, though, in cost of foundations, as our Compressors are half the size of other makes.

Mining Summary.

California Quartz Mills.

That portion of the State Mineralogist's forthcoming report dealing with statistics of mills in the State has been published in pamphlet form. The total number of mills given is 588, with 6216 stamps and 757 concentrators. Besides these, there are given 189 arrastras, patent mills, etc.

In 1858 the number of quartz mills in California was estimated by Prof. Ashburner at 280, with 2610 stamps, but he stated later that in 1861 not over 40 or 50 were in successful operation. Most of the mills enumerated in this report of the State Mineralogist are in operation.

It is particularly noticeable that in many of the newer mills in certain districts there is a tendency to use heavier stamps than were in vogue in California a few years ago. There is one mill—the Big Canyon, in El Dorado county—with 1200-pound stamps. It is a 30-stamp mill. There are 26 mills with 538 1000-pound stamps. No less than 12 of these are in Nevada county. The following table gives the mills of each county:

County.	Stamp Mills.	Stamps.	Arrastras, Etc.
Alpine	3	48	.....
Amador	31	587	7
Butte	11	108	8
Calaveras	53	708	11
El Dorado	63	713	13
Fresno	10	73	4
Inyo	42	132	21
Kern	8	138	19
Lassen	5	40	3
Los Angeles	4	30	.....
Madera	7	120	15
Mariposa	18	242	4
Mono	16	159	2
Nevada	62	575	10
Placer	27	161	5
Plumas	22	315	7
Riverside	13	82	3
San Bernardino	19	249	2
San Diego	16	310	5
Shasta	23	294	13
Sierra	16	242	1
Siskiyou	40	255	14
Sonoma	1	10	.....
Trinity	16	100	16
Tulare	2	10	2
Tuolumne	44	462	2
Ventura	1	10	2
Yuba	5	34	.....
Totals	588	6216	189

Amador.

Dispatch: Congdon Bros. are crushing rock from their mine, south fork Mokelumne river, West Point district. The rock averages $4 per ton. The vein is 20 feet wide.

At the Mitchell mine, near Railroad Flat, a new 10-stamp mill will be ready to crush in a few days. A tunnel is being run along the vein.

The old Turner quartz mine, two miles from Angels, has been taken hold of by W. J. Gracon of Chicago.

At the Alma the shaft is down 950 feet.

The Argonaut shaft is down 1400 feet.

At the Gwin the forty stamps are all dropping and work smoothly. Drifting is going on. Rock is being taken out to keep the mill going regularly.

Record: Work is to begin at once upon the El Dorado mine at Amador City. The old shaft, which is 300 feet deep, is to be cleaned out and then drifting on the vein will be put under headway. Sloss and Newman of the Alaska Commercial Company are the principals in the new enterprise and T. C. Mayon will have charge as superintendent.

Ledger: The new hoisting and pumping plant at the Dennis Kelly mine, near Pioneer creek, has been started up. Sinking and other mining operations will be resumed immediately.

The Jackson Exploration and Development Company, through the general manager, James E. Dye, has let a contract to sink 100 feet in the Amador Queen.

Republican: At the Reward mine an additional five stamps of the mill have been in motion since Dec. 1st. The mill is now of ten stamps capacity.

The old Keystone mine, at Amador City, is taking out ore of a richer character than has been seen for a number of years past. It is coming from the 500-foot level.

Butte.

Oroville *Register*: About 1200 acres of land in South Thermalito was mined years ago by Chinese. They were unable to go down deep on account of the presence of water and the lack of suitable machinery.

F. T. Sutherland has bought 140 acres of land for himself and 340 for a syndicate he represents. They will put in a large dredging plant.

Doolittle & Hammon will also handle their land in the same manner. It is stated that these dredging machines will handle this earth at a cost of 5 cents per cubic yard.

It is estimated that from 500 to 600 men will be employed on these mines.

Register: K. A. Hughson of Oakland and others have bonded the Bishop mine, located near the Palo Alto mine, three miles from Merrimac, and propose equipping it with a 10-stamp mill and other machinery early in the spring.

Calaveras.

Prospect: On the Quartz Glen, the old Foote & Thompson mine, the developments at present being made consist of a 900-foot tunnel following the lead at a depth of over 500 feet from the old Foote & Thompson works. Another tunnel, 350 feet above, is in 1000 feet and a raise has been run 160 feet, which tapped the tunnel worked in early days.

Citizen: Last month the Roanoke Mining Company at their mines—the Moser and Lamphear, at Mokelumne Hill—ran the mill twenty-six days, and the cleanup amounted to $11,000, leaving a net profit, after paying expenses, of $6000.

El Dorado.

Nugget: At the Grand Victory they are sinking below the 200 and are down 90 feet. Twenty stamps are running constantly.

They are running two Huntington mills on the Salsbury with satisfactory results. They are also crosscutting in the lower level and are meeting with good prospects.

Ten stamps are running constantly on the Starlight with good result, and the mine is looking well.

Five stamps are hammering away with good results at the Larkin.

On the Griffith Consolidated, the property recently acquired by Mr. Stent, they have struck on the 115-foot level 6 feet of ore.

A little 2-stamp mill on a ledge 12 feet wide, situated just below Shingle Springs, on Mr. Skenk's ranch, is turning out $3000 a month.

The Taylor mine is said to be sold to an English company, who will soon put on a large force of men.

The deal for the sale of the Esperanza mine is reported closed up. The company that has purchased it will expend $200,000 in prospecting, it is said.

Republican: E. Hancock of Placerville has purchased a half interest in the Brewer & Marquart gravel mine, belonging to the estate of H. H. Brewer.

Mariposa.

Miner: Denver capitalists have bonded a group of mines near Horseshoe Bend, owned by Clark, Brown and Mast, and a water right for electric-power purposes.

A 2-stamp mill is in course of construction at the Burton mine, near the Louisiana.

The Merced Company are increasing their force of miners slowly, and new development work is being commenced on their several mines.

The Laura La Grande mine at Hazel Green, owned by the MacFarlanes and Duncan, has been closed down for the winter. Five stamps more will be added to the mill in the spring.

Mono.

Miner-Index: Although the cyanide plants have mostly shut down on account of the cold weather, the upper Standard plant will run during the winter, as the new method adopted to force tailings through pipes direct from the mill into the cyanide tanks proves to be a success.

In the Phœnix mine, on Queen Bee hill, several men are taking out fair-grade ore and will soon have a crushing.

Graham & Co. have again resumed the extraction of ore from the whim shaft on the Noonday property.

There is a force of men employed at the Gov. Stanford shaft, with good prospects.

In the Free Coinage mine men are exploring ground.

At the Addenda—or, as it is now called, the Contention—a large force of mechanics and miners are employed putting up heavy machinery, which will soon be in readiness to operate on the 500 and 600 levels, where a great deal of ore is in sight.

At the Con. Pacific N. Tobias is extracting ore.

The Bodie Tunnel ground has been partially explored, particularly by leasers, who have done so well that the owners, Cain & McCone, bought out the leasers and started up the mine and mill actively, and are now extracting and crushing about forty tons of ore per day, averaging $20 per ton.

The Bodie, Bulwer, Sunshine, University, Belvidere and other mines are steadily operating.

The last crushing at the Syndicate resulted satisfactorily, so that Captain Tyack has started men to work taking out ore for another crushing.

The shaft on the Midnight mine is being retimbered, preparatory to the extraction of ore which is in sight below.

Nevada.

(Special Correspondence).—J. J. Halpin of New York City, general manager of the Brunswick mine at Grass Valley, who has been inspecting this property recently, has placed a new superintendent in charge and returned to his home. The 20-stamp mill which has been idle since October, for the purpose of erecting new tramway and ore bins, will be started again on January 1st. The company has a 4-foot ledge on the 800 and a like vein on the 900 level, of high grade ore. This property was idle for seventeen years, after an English company had worked it to a depth of 300 feet, until the present company purchased it five years ago. The company is incorporated, but not a share of stock is for sale.

The Pennsylvania at Grass Valley has a 5-stamp mill and has reached the 800 level. One month's cleanup resulted in a product of $10,884 in gold and $1,605 in sulphurets.

Union: The miners in the Mountaineer have uncovered a ledge in the bottom of the shaft. The ore shows well in free gold.

In the Lucky Al, belonging to J. Sawtelle of Marysville, a 3-foot ledge has been struck.

Transcript: In the Giant King, in the Washington district, on the surface the pay chute was about 25 feet wide, and at a vertical depth of 200 feet it is 76 feet in width. Samples of ore have been taken every few feet on the croppings and in the tunnel and tests made, the average of all assays being $5.65 per ton.

Union: A good ledge has been struck in the 265 level of the Home mine. It is 4 feet wide.

Placer.

Colfax *Sentinel*: Development work is in progress at the Bald Mountain gravel mine, twenty miles above Westville. They expect to work six men during the winter.

At the Cedar Creek gravel mine, near Shady Run, Superintendent Rodger will make an upraise into gravel from the lower tunnel about December 25th.

At the Derby mine, at Centerville, an upraise has been made 800 feet in on the main tunnel. Gravel was found and the prospect drift is now about 40 feet ahead of the main tunnel.

The new lower tunnel at the Drummond mine is being crowded rapidly ahead. Power drills are used.

Hoffman, McDonald & Henning have a permit and are preparing to mine by the hydraulic process at the Gilbert claim on Georgia hill, Yankee Jims.

The tunnel at the Eureka gravel mine above Centerville is now in 1777 feet.

Plumas.

Independent: C. D. Hazzard, owner of the Plumas Imperial mine, has been making extensive improvements on his property, preparatory to an active season's work. New ditches and flumes have been bui t, pipe laid and the restraining dam raised.

Professor Thomas Price has started work in the Diadem mine for the people who contemplate purchasing it from Major McLaughlin and others.

San Diego.

Yuma *Sentinel*: The Ponce de Leon Mining Syndicate has fifty men at work doing the assessment work on its mines in the White Gold and Picacho basins.

The Golden Dream Company is crowding the work on the Alfonso, Little Frank and Sambrano shafts, on the Noonday mine, in each of which rich ore has lately been struck.

The Gold Crown Mining Company has completed the possession work on its group of five mines on the Yellow Gold vein.

Senator Dorsey, W. A. Farrish of Denver, Colo., and C. J. Bell of Scotland have completed their examination of the Picacho mines and are on their way to London, where the deal will be completed for the thirty-six mines secured by the Senator.

Shasta.

Searchlight: There are about 1000 tons of ore on the Lucky Baldwin dump awaiting the completion of Captain Roberts' mill, which has just been finished. The lowest tunnel on the Lucky Baldwin is now 260 feet in and runs on good ore all the way, with 3 feet average width of ledge.

Captain Roberts has started development work on the Gold Hill, a parallel ledge. About forty men are employed on this property.

A. J. Fowler and Fred Hurst have purchased the old mill formerly run as a custom mill by W. R. Conant, and are crushing ore from their property, the Lucky Baldwin Extension.

Harrison Gulch contains a population of 300 and is growing rapidly.

The owners of the Uncle Sam mine, the Sierra Buttes Gold Mining Co., have started a crosscut prospect tunnel on the lowest level. The objective point is the North Vein. This ledge shows up well on the surface.

The Furnaceville mines on North Cow creek, owned by an English company and under the management of J. Enright of the Shasta Lumber Co., have been closed down for the winter owing to the rain. The thirty-ton smelter of the water jacket pattern has treated the rebellious ores satisfactorily. A small smelter was used for the experiment, but as all arrangements will permit an output of 100 tons daily the smelting capacity will be increased when work is resumed.

At French Gulch the Ellory mine, superintended by G. W. Grayson, Jr., is working fifteen men.

Six men will shortly be put to work developing the Sibyl claims, recently sold to a New York company by W. B. Murdock.

In the Gladstone mine five men are doing prospecting work, in the hope of again opening up this property.

Siskiyou.

Journal: The quartz ledges around Scott Bar have all closed down, and no work will be done.

The owners of the Mabel mine expect to take a large amount of ore out next year, the building of their new mill this year having interfered to a great extent with their work at the mine.

The placer mines in the Salmon river country will all be in operation soon, and will no doubt have as good a season as usual.

The Black Bear is at work, but the 20-stamp mill at the Gold Ball mine is still idle. It has been reported several times that the differences over the Gold Ball were to be settled and that the mine was to be started up, but as yet nothing has been done, and the property is still in charge of a keeper.

Negotiations are under way for the sale of the Commodore mine on Barkhouse creek.

The hydraulic miners on the lower Klamath are at work, and will be enabled to keep at it through the winter, as they have a large supply of water and considerable snow has fallen in the mountains already.

At the Katie May mine on Greenhorn creek the owners, Bailey & Carrick, are running a tunnel to tap the ledge lower down.

Journal: The big Espey, Hunter pump, on Shasta river, near the electric light plant, will soon be started up, the property now being owned by Harry Hunter and George Simmons. This pump is said to be one of the largest ever manufactured, forcing the water to a height of about 530 feet, and a distance of about 1100 feet to the brow of the hill, being carried from there in ditches and flumes to the mine just below Hawkinsville. At first, considerable trouble was experienced in the working of the pump, but it finally worked most satisfactorily, no trouble having been realized for some time previous to its closing down.

The mines on the Klamath river will no doubt have to close down after this heavy rain, as the streams have all been rising quite rapidly.

Trinity.

Journal: At Cinnabar the Altoona Quicksilver Company are working a full force of men and will do so through the winter. On the mine the company is working its main shaft, which it will continue 400 feet below the lowest level, thus opening up a large body of ore.

At the Integral mine twelve men are at work. The company is running a deep prospecting tunnel. They are in 400 feet and intend driving the tunnel in 1200 feet.

At the Strode mine above Trinity Center the mill has been shut down for the season, but the mine will be run through the winter. A short time ago the lower tunnel cut the ledge at a depth of 800 feet, giving over 500 feet of new stoping ground.

At the Nash mine on Coffee creek the company have been working about seventy men this fall, but have now reduced the force to twelve, as that is all that can be worked to advantage.

The Hill group of mines on Coffee creek and other prospects have been closed down for the winter.

The Bloss & McClary mine is thoroughly fitted up and is being run night and day.

NEVADA.

Pioche *Record*: The Burro mine, worked by Baker and co-owners at State Line, is said to be the only prospect now turning out ore in paying quantities there. The vein is still small, but it is very rich. Other claim owners are still working away.

Walker Lake *Bulletin*: Eighteen tons of Oneida ore were milled in Hawthorne last week, and the product was $1800.

At Silver Peak the Silver Peak Co. has another run of ore on the mill dump, which will keep the mill going for ten or fifteen days. The ore comes from the Drinkwater and Western Soldier mines, which would be valuable properties if developed and properly worked; but as long as the present process of gouging goes on and the mills are employed half the time, they are a curse rather than a benefit. Carpet-baggers have gutted and gouged here for all the thirty years since the discovery of the district, and the 800-foot tunnel on the Mary mine is the only legitimate mining which has been done in all that time.

Over in Alida valley Barnes, Keyser and Cunningham have made another shipment of silver ore which will average 2000 ounces to the ton.

White Pine *News*: The North Mountain Mining Company at Egan, having satisfied themselves that the cyanide process is a success, have decided to change the battery to the roller process with a much larger crushing capacity.

The negotiations for the purchase of the Ben Hur, Belmont and two other mines in Granite district, Steptoe valley, the property of W. D. Campbell, have taken definite shape. The purchasers have entered into an agreement to pay $25,000 for the property, including Mr. Campbell's ranch, water rights, etc. The development of the mines must also be continued during the time in which the payments are to be made.

Recent assays from the new strike on the Midnight run $155 in gold and 12 ounces in silver.

Hawthorne *Bulletin*: Col. Ed. Boyle, W. D. Tobey and Bud Bliss have visited the Big Indian mine to determine the point of starting the 1000-foot tunnel. Work will begin next month.

Reno *Gazette*: The Nevada National Nickel Company of Cottonwood, in Churchill county, will start up its electrical plant next week. The Nickel Company has spent large sums of money in an electrical plant for reducing the ore, and if the experiment is a success, regular shipments will be made after next week.

OREGON.

JACKSON COUNTY.

Taylor & Crow brought up another carload of 13¼ tons of ore from their mine, near Merlin, which netted $2,866.77.

Supt. James has begun work at the Shorty mine.

Democrat: The Virtue, White Swan and Flagstaff, just east of Baker City, employ about 200 men steadily. Then there are many smaller companies operating. The E. & E. Con. Mining Company, North Pole Mining Company, Columbia Mining Company and the Luverne Mining Company at Bourne and the Bonanza Mining Company at Clifford have headquarters at Baker City.

The Perry mine, operated by J. W. McCoy, has 400 feet of shafts and tunnels. He will sink 100 feet deeper, or to water level, at which time a mill will be erected upon the property.

W. Talmage, a capitalist of New York, has secured a ninety days' option to purchase the Sparta canal and quartz properties, owned by Captain Clough.

The Gold Ring Mining Company contemplates extensive development on the Rachel mine. A mill will be erected on the property in the near future.

With the opening of the coming placer season the Grant Brothers will carry on operations on a large scale at Granite. They will employ upwards of 100 men.

The south extension of the Ohio, known as the Climax mine, owned by G. W. Grayson, is being developed under the direction of Phil Bishop.

The shaft at the Columbian mine is being straightened and a skip is being put in. Drifting on the ledge is to be started.

Jacksonville *Democratic Times*: The Blalock mine, on upper Grave creek, is being operated with two giants in a red gravel formation, with good prospects.

Operations have been resumed at the Black Channel Company's mines in Foots creek district. About thirty men are employed. Some

extensive improvements have been projected and a ditch will be dug and reservoirs built.

The Oregon Siskiyou's Mining Company has been incorporated to develop mining property in Jackson county. The capital stock is placed at $50,000. I. G. Rowley, G. H. Himes and A. Rowley are the incorporators.

WASHINGTON.

Spokesman-Review: W. M. Pinkerton of Boundary has sold the Hall mines, known as the Washington and J. I. C., to W. H. Reid of Tacoma for $12,000. The ore assays $4 in gold, 45 ounces in silver and 70 per cent lead to the ton.

From the Snowshoe mine 150 tons of ore are being taken daily.

A. A. Brann, in connection with other Spokane parties, has bonded the Standard mine, near Chewelah.

BRITISH COLUMBIA.

The titles to the townsite of Sandon, British Columbia, are to be questioned by the Kaslo and Slocan Railroad, on the ground that the land in controversy is within that belt of country granted as a subsidy to the railroad by the Government. During the past year the townsite has been well settled and a great many transfers have taken place.

Surveyors are picking out a line for the Great Northern Railroad into the Kootenay mines. With the completion of the Trail & Robson Railroad, which is expected by the first of May, three competing lines will be bidding for the business of the Slocan district—the Spokane & Northern, the Trail road and the Canadian Pacific.

Montana mining men have bonded the Ram's Horn group of mines, eight miles north of Fort Steele, East Kootenay, for $50,000.

At Rossland the War Eagle has been compelled to close down two or three times of late owing to the impossibility of getting the accumulated ore out of the way.

The Ida May, on the east slope of Red mountain, has been sold to a syndicate organized by A. B. Clabin for $6000 cash.

At the Ottawa the crosscut has gone into solid ore 4 feet and the hanging wall has not yet been reached. The ore on the surface is arsenical iron, but that found below carries about five per cent copper. Assays obtained show the ore to be worth $40 per ton, as follows: Gold $33.60; silver two ounces, copper five per cent.

Spokane *Chronicle*: Mackenzie and Dick, of Rossland, have bonded the Alpine group of four claims on Eight Mile creek for $60,000. They have a very strong free milling ledge which will average ores $20 to the ton and intend putting up a stamp mill early in the spring. These two gentlemen have also bonded properties in the Ocean group on the head of Lemon creek for $37,500.

North and Grant-Givan of London, who bonded the Little Darling and Flossie L. last September, have made the first payment on the bond. They have cabled, asking for an estimate of the probable cost of developing these properties.

The Hall Exploration Company has bonded from J. J. Malone, P. T. Stimley and T. G. Roy, the Apex, Silver Reef, Acme and Curfew on Toad mountain for $30,000.

In East Kootenay a large amount of placer work was done on Wild Horse creek this year and it is estimated that $100,000 was taken out by the companies operating there.

The British Canadian Gold Fields Company has purchased the Voyageur claim in the Slocan. Work will commence at once.

UTAH.

Tintic *Miner*: At Tintic a company has been organized with $300,000 capital stock to work the Rabbitsfoot.

The new working shaft on the North Star is now down 120 feet and will be sunk probably to the 1000-foot level without stop, except to cut stations.

The shipment of a 22-carload lot of concentrates from the Mammoth mill this week is the largest single shipment of the kind ever made from Tintic.

Salt Lake *Tribune*: At Mercur C. H. Jacobs has started ten men to work on the Dexter group, just east and south of the Cannon shaft.

The enlarged milling plant at the Geyser, with a capacity of 110 tons, has been started up.

The Mercur mine is reported looking better than ever before. At the bottom of the incline, off the Resolute tunnel, a body of ore heavily impregnated with cinnabar is now exposed, while at a point under the old Mercur tunnel a new and independent stratum of ore has been uncovered.

The shaft on the Gold Reserve, which is now down 100 feet, will be continued another 400 feet. It lies east of the Overland and is owned by Wall, Davis and others.

It is stated that work on the Glencoe and Annie will be resumed early in the year.

The Niagara management has made the connection, for which it has been driving for some time, between the shaft on the Spanish and tunnel from the Eighty-nine, and sinking on the ore will begin at once. The work was undertaken a short time ago and after an unsuccessful effort had been made to locate the ore chute from drifts off the "long tunnel," which has now penetrated the hill for a distance of nearly 3000 feet.

At Silver City the shaft on the Sunbeam is now at a depth of 350 feet.

The promoters of the North Star are contemplating the erection of a mill.

The managers of the Dalton & Lark have about decided to erect reduction works to handle their ore. If the plans are adhered to the works will be erected on a much larger scale than was originally intended, and will be of sufficient capacity to handle the ores from a number of other properties in the same locality.

At Maysvale the Webster, owned by R. C. Chambers, J. B. Haggin and W. R. Hearst, has been extensively explored. A tunnel has been run in on the ledge for a distance of 1400 feet, and in the breast there is exposed 6 feet of galena and carbonate of lead that shows 23 per cent lead, 25 ounces silver and gold of the value of $1.50 per ton. From the tunnel station a crosscut was recently run 180 feet west and in the porphyry is now exposed 10 inches of the very high grade ore that has at times been found in the district. The strike has created considerable excitement in the locality.

At the Crystal the ledge was reached at a point 200 feet from the mouth of the tunnel, and drifting is now going on in both directions from that station. The ore—of which there are 5 feet—shows a value of 30 ounces silver, 25 per cent lead and $3 in gold.

Park *Record*: Operations in the deep shaft at the Lucky Bill have been suspended for the present, and the company is devoting all its energy to sinking the winze on the new ore body recently discovered.

A large shipment of high grade ore has been made from the Woodard lease, on the southeast end of the Crescent Company's ground.

The vein recently encountered in the Alice is more than holding its own in appearance, and looks better than it did two weeks ago, when first cut. The shaft is now nearly 200 feet deep and has gone through two separate veins.

Charles McFalls and associates are about to let a lease and give a bond on their New York group of claims, lying south of the Ontario.

Park *Patriot*: The Crown Point shaft is down 320 feet. A drift is being run from that point to tap the ledge.

The Daly West is taking out about 150 tons a day, but owing to the condition of the roads is not shipping.

Bingham *Bulletin*: Operations at the Frisco mine include a new shaft, sinking by three eight-hour shifts.

The Dalton & Lark force is being increased, and there are now thirty men at work.

IDAHO.

Cœur d'Alene *Sun*: At the Idaho mine the new strike has widened to 6 feet, 3 feet of which is shipping rock.

Spokane *Chronicle*: In the Florence district it is proposed to commence a tunnel at near the level of the Salmon river and running for a distance of about four miles to tap the entire camp at a depth of about 2000 feet. The tunnel is to be made large enough to admit of a double track and will be provided with air drills and electric light, the power to be supplied by compressed air. A company has been incorporated to carry on the work, and all the claims in the line of the tunnel are now being pooled.

The Hi Yu has been secured by A. Walker, who will incorporate a company to operate it.

The Ozark Company has recently put in a 5-stamp mill on their property.

The Oregon has been purchased by Tedrow and King, who will put in a hoist and begin the work of sinking a shaft.

The Lucky Boy near Custer City is turning out fifty tons a day.

Spokesman-Review: At Murray in the Dora and Katie Burnett Consolidated Mining Company's property a new strike has been made in the tunnel at the level of the mill, and consists of a 6-foot ore chute, 3 feet of which will be shipped to the smelter as crude ore, it running so high in sulphurets that the amount lost through milling would be greater than the freight on the waste that would be extracted.

SOUTH DAKOTA.

Black Hills *Times*: About twenty men are working on the Richmond and good ore, carrying silver and lead, is being taken out.

At the Ellenberg fraction a depth of 30 feet has been attained, at which point the ore assays $68.40 per ton.

At the Sundance they have come to gouge matter at a depth of 250 feet.

MONTANA.

Marysville *Mountaineer*: The 200 men laid off by the Boston & Montana have gone to work again.

At the Gold Coin the ledge is opened to the surface by shafts and surface openings a distance of 2,000 feet, and it is from 9 to 16 feet in width. It is claimed that there are 200,000 tons in sight. It is expected to start up the new mill soon.

The Pennington property which was sold two years ago to an English syndicate will be started up. A representation has arrived from London to let contracts, and to engage a force of men to erect a 10-stamp mill and dwelling houses at once.

At the headwaters of the Big Blackfoot river a Helena company has several men making copper locations and Marcus Daly has a number of men developing prospects in the same locality.

Great Falls capitalists have bonded the Independence claims lying northeast of the Alabama.

The total output for October for the Montana Mining Company, Ltd., was 6,400 tons of ore, which contained 4,270 ounces of gold, and 20,960 ounces of silver of an estimate value of $99,100. The expenditures were: Working expenses on revenue account, $32,100; outlay on developments, $12,300; outlay on Blue Bird and Hickey mine, $100; extraneous expenses, $4,300; permanent improvements and machinery, $200; total, $39,300, leaving a net result of $59,800.

The Little Kid mine, on Meadow creek, is running day and night on good ore, and about twenty tons per day are treated.

At Philipsburg, W. J. Quigley is appointed receiver for the Golden Sceptre Gold Mining Company at Quigley.

Inter-Mountain: Much interest is attached to the fact that bids are asked for sinking the Atlantic shaft an additional 200 feet. The Atlantic is the extreme eastern property of the Boston & Montana, upon which a shaft 600 feet deep has been developed. During the past few months crosscutting has been in progress and several stringers of copper ore of a low grade have been discovered. At a depth of 600 feet, while running the crosscut tunnel, the workmen cut through the bed of an ancient river channel. It is the belief of a good many California mining men in this city that if this ancient bed is prospected it will be found to be rich in gold.

COLORADO.

The Lillis Coal Mining Company has been organized at Telluride, Colorado. It has 600 acres of land underlaid with coal, and proposes to supply Telluride mines and others.

Central City *Register-Call*: The November output of the Hidden Treasure, Indiana and Kansas mines in Nevadaville, which are operated by the Gold Coin Mines Company, reached the total of $23,000. The Gold Coin Mines Company operates the largest producing properties in this county, and employs a force of from 150 to 160 men in its mines and mill.

At the Bobtail a total of fifty stamps are crushing ore, twenty-five of which are treating ore taken from the Bobtail tunnel and incline by tributers. The other twenty-five stamps are dropping on ore from the Fisk mine.

At the Mead mill the forty stamps are kept running day and night on ore from the Gunnell mine.

At Idaho Springs a plan is on foot for cutting the many lodes on the Alps mountain with a tunnel and at the same time furnishing drainage and cheap mining and transportation from the Chicago creek side.

Chicago capitalists have secured control of the Olivette claim and are preparing to develop it.

The Iowa Gold Mining and Milling Company of Silver Lake basin, San Juan county, reports $27,000 as the output for November, resulting from the treatment of 700 tons of dry concentrates, which represents 2800 tons of crude ore, an average of about $9.64 per ton, as the ore comes from the mine. The mine and mill now employ 125 men, and the daily product is 125 tons of ore, of which eighty tons is treated at the mill, more than 33 per cent of the output being stacked up as a reserve for the mill.

Denver *Republican*: At Cripple Creek the November production of the Isabella Company is given at 400 tons of smelting and an equal amount of mill ore, the net proceeds being $30,000. The profit was about $15,000 and was added to the $74,000 reserve fund of the company. The seventh level, run from the 550-foot station in the Buena Vista incline shaft, is run 300 feet into the ore and shows an improvement over the level above. The November record is about $7000 better than that of October. The mine employs 135 men.

The Foley Leasing Company shipped fully 1000 tons of ore from the Lillie during November. Of this 300 tons were first grade, averaging about $80 a ton, and the balance a $35 grade.

A sixth level is being started from the bottom of the 500-foot shaft of the Lucky Guss, and the ore being broken in its progress is some of the richest that has ever been mined in the property.

A mining camp of which little has been heard is that lying east of Victor in the Cripple Creek mining district, in which about 800 claims have been located, thirty of which have been prosecuted to patent. The district is comparatively new but has attracted a great deal of attention from Cripple Creek mines and enough work has been done to show that it has an immense deposit of low-grade ore. In several of the claims considerable bodies of sylvanite have been discovered.

The Elkton mine broke all records last month. The gross production from the property is placed at $85,000. The smelter and mill charges aggregate about $10,000, and the mine operating about $13,000, which leave the net earnings about $62,000.

At Silverton the Iowa mine is shipping at the rate of fifty tons of concentrates per day.

The Homestake on King Solomon mountain is to be opened up soon for a winter development campaign.

The Guston has recommenced operations with about twenty men.

Twelve men are working in the Hercules on Sultan mountain and shipping a car per week to the local smelter.

At Puma City a strike of sylvanite has been made in the Climax mine, owned by Wm. Stubbs. An assay made by a local assayer returned $20,000 per ton. This is the first sylvanite that has been found in this district and bears out the claims made by the early prospectors, who went from Cripple Creek and made locations as early as 1893, and who firmly believed that it was an extension of the same ore belt upon which the Independence and Portland mines are situated.

Mining Record: At Lake City, on the Black Crook group of properties, a 700-foot tunnel has been driven during the past summer, and during the first days of December a body of ore carrying telluride of gold, ruby and wire silver was encountered in the drift now being run upon the vein.

The Crown Mountain tuunel, a proposition to cut the Silver Coin, Armatage, Garlock and Rip Van Winkle veins in Hotchkiss mountain at a great depth, has been resumed.

In Pitkin Leadville and Chicago parties have started up the Raymond mine.

The Iris tunnel, being driven by Pittsburg, Pa., parties, is now in about 200 feet. It is crosscutting an immense mineralized porphyry dyke.

Pitkin *Miner*: The Iron Cap property, adjoining the Red Jacket, owned by the Cleopatra Silver Mining Company, was started up last week.

Henry & Wyckoff are operating the Mono cyanide mill with success.

ARIZONA.

Globe *Silver Belt*: An important strike of rich ore is reported to have been made recently in the Mazatzal copper mines, near Payson, and bonded to E. E. Wann, of Denver, who is working a force of twenty men developing the claims.

Tucson *Star*: A shipment of 250 tons of ore is being made from the Duquese mine to Pittsburg, Pa., for a trial test.

Phœnix *Republican*: At Congress camp the 40-stamp mill of the Congress Gold Company is running full time. The company is practically rebuilding the cyanide plant and is erecting a large roasting furnace in which to roast the tailings before cyaniding. When finished this will be the most complete and best cyanide plant in Arizona. The camp has grown wonderfully in the last twelve months, having more than doubled in that time.

Shear & Falco have several men at work on their property tunneling.

MEXICO.

Nogales *Vidette*: The mining camps of La Colorado and Minas Prietas are but a mile apart. The principal mines are the Creston, the Grand Central, the Amarillas, the Colorado and the Verde, although the last two named are at present not being worked.

The Creston mine supplies with ore the Prietas mill with forty stamps and the Colorado mill with thirty stamps and three Huntington mills. About one-third of the ore is taken from the lower or 1000-foot level. Most of the ore, however, is now taken from the 800 foot level. The entire production of the mine is from 180 to 200 tons daily, but it is claimed that, worked to its full capacity, this mine would keep 200 stamps constantly at work.

A depth of 500 feet has already been attained in the Amarillas mine, the ore from which supplies the Grand Central mill, with ten stamps and three Huntington mills, and the Amarillas mill with twenty stamps.

At the Grand Central mine a new four-compartment shaft is being sunk which is now down 180 feet. The shaft will be sunk to a depth of at least 1000 feet and the first station will be put in at a depth of 800 feet.

SOUTH AFRICA.

The following reports from large mines on the Rand for September—one, the Ferreira, for the quarter ending Sept. 30—show some striking similarities that are the result of careful management. On the Rand the mine owners are thoroughly imbued with the idea that every effort must be bent toward economical working of ores. The fact that a slight reduction in this cost will add more to the value of a mine than anything else, is appreciated there more than anywhere else. The managers are not looking for new ore bodies, as are those in California and other fields, so much as cheaper methods of working. This is shown by the careful management of the mills, which are kept running full time, and the large amount of work in crushing got out of the stamps.

May Consolidated.—100 stamps ran 27 days, crushing 12,250 tons; gold won (average yield, 6.044 dwts per ton), 3,700 ozs; value, £13,413 15s; tailings treated by cyanide, 9,250 tons; gold won (average yield, 4.216 dwts), 1,950 ozs; value, £5,850. Working costs, 21s 2 90d per ton; total, £13,010 10s 7d; tailings treatment (Siemens-Halske process), 2s 8.806d per ton; total, £1,264 7s 9d.

New Primrose.—Mill: 160 stamps ran 27 days 6½ hours, crushing 22,912 tons of ore, yielding 6,093 ozs of smelted gold, at a cost of £19,921 for milling, mining and general charges, equal to 17s 5d per ton. Cyanide: 13,090 tons of tailings yielded 3,950 ozs smelted gold: cost, £3,075 0s 2d, or 4s 8d per ton. Mine: Risen, 150 feet; driven, 818 feet; sunk, 198 feet; developing, 35,155 tons of ore. Financial: total cost of working, £22,996. Profit for month, £11,721.

Rodepoort United Main Reef.—Mined, 8,425 tons: less waste rock discarded, 800 tons; milled, 7,625 tons; developed in excess of that mined, 7,834 tons. Mill: Days working (70 stamps), 26; tons crushed, 7,625; yield in gold, 3,249 ozs 17 dwts; yield per ton, 8 53 dwts. Cyanide Works: Tons tailings treated, 4,593; yield in gold, 912 ozs; yield per ton, 3.95 dwts. Profit for month, £5,611 6s 7d. Working Cost: Mining, 17s 1.79d per ton; milling, 2s 8.75d per ton; general charges, 1s 1.03d per ton; total, 20s 11.57d per ton: value of yield, 31s 11.59d per ton; profit, 11s 0.02d per ton. Cyanide working, 5s 8 81d per ton; value of yield, 11s 10.81d per ton; profit, 6s 2d per ton.

Princess.—Mine: Number of feet sunk and driven, 748. Mill: Number of days (24 hours) working 40 stamps, 25; ore milled, 4,178 tons; yield in smelted gold, 1,996.82 ozs; average per ton, 9 56 dwts. Cyanide Works: Tons of tailings treated, 2,426; yield (in bullion of 60s value), 510.8 ozs. Profit for month, £2,121 14s 8d. Working Costs, per ton: Mining, hauling and pumping, on 4,178 tons, 16s 7.8d; sorting and tramming, on 4,178 tons, 1s 6.9d; reduction, on 4,178 tons, 4s 1.3d; general charges, on 4,178 tons, 2s 5d—24s 9d; mine development redemption, on 4,178 tons, 6s 6d; cyanide works (on tonnage treated, 4s 3.5d), on 4,178 tons, 2s 5.9d—total, 33s 8 9d.

Crown Reef.—Profit of £15,557 8s 1d. Mine: Number of feet driven, sunk and risen, exclusive of stopes, 1,157½; quartz mined, 16,209 tons; quartz on hand, at surface, Sept. 30, 8,213 tons. Mill: Number of days (24 hours) working 120 stamps, 29 14-24; tons crushed, 16,298; tons crushed per stamp per 24 hours, 4.590; yield in smelted gold, 6,955 ozs 1 dwt; yield per ton, 8 dwts 12.836 grs. Cyanide Works: Tons sands and concentrates treated, 12,804; yield in smelted gold, 4,182 ozs 8 dwts; yield per ton, 6 dwts 12.791 grs; working cost per ton, 3s 4.140d; royalty cost per ton, 1s 3.266d; total cost per ton, 4s 7.406d. Slime Works: Tons slimes treated, 2,548; yield in smelted gold, 330 ozs 10 dwts; yield per ton, 2 dwts 14.260 grs.; working cost per ton, 6s 3.005d; royalty cost per ton, 3.286d; total cost per ton, 6s 6.291d. Total expenditure per ton, 27s 11.459d; value per ton, 47s 0.556d; profit per ton, 19s 1.097d. Development work done for the month, 1,157½ feet; the tonnage of ore

exposed by the development work amounts to 30,664 tons.

City and Suburban.—Profit for month, £11,114 0s 5d. Capital expenditure, £3,132 14s 8d. Total expenses per ton, 26s 0.5787d; value of yield per ton, 37s 4.7273d; profit per ton, 11s 4.1488d. Driving and sinking done during the month, 1,113 ft. 10 in.; ore developed during the month, 17,264 tons; estimated quantity of ore developed at Sept. 30, 387,717 tons. The milling results for the month are as follows: 160 stamps worked 24 days 8 hours 52 minutes; tons (2,000 lbs) crushed, 18,900; tons crushed per stamp per day, 4.847; yield in smelted gold, 6,142 ozs bullion; yield per ton by amalgamation, 6.4994 dwts bullion; assay value of tailings per ton, 4 754 dwts fine gold. The results by cyanide treatment for the month are as follows: Tons treated (2,000 lbs) at a cost of 4s 10.8667d per ton, 13,938; assay value of tailings per ton before treatment, 5.222 dwts fine gold; bullion produced (equal to 3,066.854 ozs fine gold), 3,825.95 ozs; yield of gold (in bullion) per ton treated by cyanide, 5.4898 dwts; yield of gold (fine gold) per ton treated by cyanide, 4.4006 dwts. Yield in fine gold per ton crushed—by amalgamation, 5.5940 dwts; by cyanide, 3.2453 dwts; by slags, 0.1396 dwts. Total yield in fine gold per ton from all sources, 8.9789 dwts.

Ferreira.—For quarter ending Sept. 30: Profit for quarter, £87,316 5s 4d. Capital expenditure, £15,181 4s 2d. Rock cut during the quarter, 2,120 feet. Mill: Ore crushed, 30,729 tons; ore crushed per head per day, 4.54 tons; bar gold extracted, 25,897.05 ozs; yield per ton, 16.855 dwts; concentrates caught, 714 tons; assay value of concentrates, 6 ozs 10 dwts 12 grs. Cyanide Works: Tailings treated, 27,173 tons; bullion produced, 10,345.30 ozs. Sorting: Waste rock picked out during the quarter, 17,811 tons. Dividend: Dividend No. 11 of 125 per cent (£112,500) has been paid during the quarter.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING DECEMBER 8, 1896.

572,825.—AXLE BOX—McK. F. Bishop, Alameda, Cal.
572,858.—RAISIN SEEDER—S. B. Bliss, Pasadena, Cal.
572,859.—STRIKE PLATE FOR LOCKS—Rosalind H. Bower, S. F.

572,735.—FASTENER—W. V. Thompson, Pasadena, Cal.
572,842.—IRRIGATING PLANT—A. W. Towne, Pomona, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

STRIKE PLATE FOR LOCKS.—R. H. Bower, San Francisco, Cal. No. 572,859. Dated December 8, 1896. This invention relates to an improvement in strike plates for mortise locks. It consists essentially of a plate to be secured to the door casing, having a slot formed longitudinally in it, having an outwardly projecting strike from one edge, said plate having the vertical side walls of its slot formed with tongues or grooves, a second plate fitted to slide within the slotted portion of the first-named plate and having its vertical edges correspondingly grooved or tongued to fit the edges of the first-named plate, and having independent openings, one for the latch and the other for the bolt of the lock, with a means for securing the slidable plate in its adjusted position. This allows the movable plate to be raised or lowered so as to keep the latch and bolt openings always in line with the latch and bolt and thus compensate for any variation which may be caused by the settling of any part of the house, which would ordinarily throw these parts out of line and necessitate a new arrangement by moving the strike plate.

NUTS.—Milton A. Clennam, San Francisco, Cal., assignor of one-fifth to Henry Sylvester, same place. No. 572,743. Dated December 8, 1896. This invention relates to an improved nut for use upon bolts. It consists essentially in forming a nut of a strip of metal made thickest at the center, tapering in each direction therefrom and coiled so that the thinner ends overlap upon the opposite sides of the thickened central portion of the nut blank. After being thus coiled the thread is cut in the central hole of the nut thus formed. This provides an elastic nut which in itself forms a lock to prevent its being shaken off, and as the nut blanks are formed from strips rolled of considerable length, which are cut off to the proper thickness the instant before the nut is formed, it leaves a bright surface of metal free from scale in which the thread is to be cut, and the greatest strength and depth of the nut blank is attained at the central point, which forms shoulders against which the ends of the coil abut and prevent the tendency to coil closer and bind upon the tool when the thread is being cut.

A Gold Mine That Pays You

Is what you are looking for. We will sell 5000 shares of our capital stock and use it to reach our 370,000-ton ore chute and put up a small mill. No hoisting to do; no pumping. This means dividends. No assessments. Shares $1 each, payable 1-10 monthly. MARIPOSA GOLD CO., No. 3 California St., Room 61, San Francisco.

British Columbia.

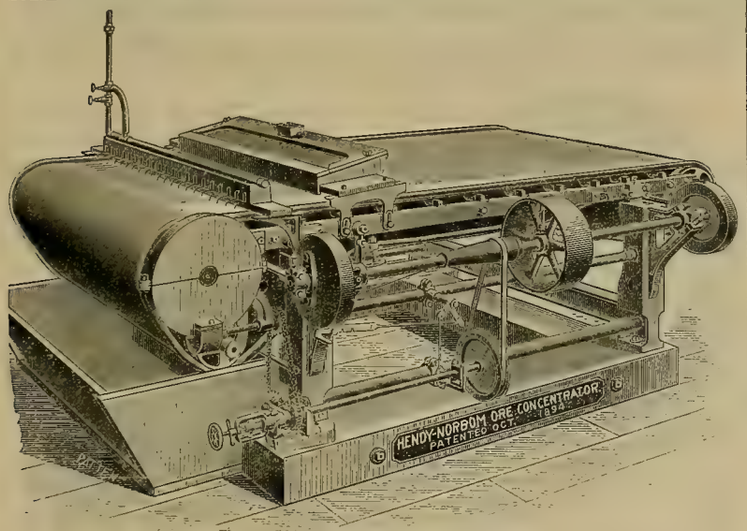
MINING AND MILLING MACHINERY.



HENDY-NORBOM CONCENTRATOR.

Office of G. McM. Ross, Superintendent Webb Gold Mining Company,
Brown's Valley, Cal., September 14, 1896.

Mr. John O. Norbom—Dear Sir: I have been using your Concentrators at our mines in Brown's Valley and am pleased to inform you that they are in every respect thoroughly satisfactory. When erecting the plant at the above-named place we built Canvas plant, but since putting in your Concentrators we have but little use for that. The percentage of sulphurets now being handled is from 1½ to 2 per cent, mostly galena and iron pyrites, and crushed fine. We save from the pulp over your machine 98½ per cent, and it hardly pays for the labor on the Canvas plant. The motion given your Vanner by its delicately constructed curved springs renders it a perfect machine, and in my estimation it is but a short time before it will replace all other machines of a like nature now in use.

Yours very respectfully, F. W. Page, General Manager.

Improved Self-Contained Cushion-Frame Five-Stamp Mill.
Patented in the United States and Foreign Countries.

The Improved, Iron-Frame, Self-Contained, Cushion-Frame, Five-Stamp Mill Saves Bills for Heavy Timbers, Millwright and Mechanics' Labor, and a Large Amount of Space. The term "Self-Contained" Means a Great Deal to the Mine Owner, and Can Be Readily Recognized and Appreciated in Making an Estimate For an Ordinary Five-Stamp Plant, When the Comparative Cost is Considered Over a Wood-Frame Mill.

FIRST: There is Saved by the Use of This Mill a Large Bill for Heavy Timbers, in Many Instances Obtained at Great Expense and Loss Of Time.

SECOND: The Saving in Mill-Wright and Mechanics' Labor in Framing and Erecting.

THIRD: The Large Amount of Space Saved.

Late improvements in the amalgamation and concentration of ores enable us to offer to the mining public, in connection with our Self-Contained Mills, an apparatus which amalgamates and concentrates at the same operation and provides a perfect trap for escaping quicksilver. Write to us for information.

Send for Catalogue and Price List.

Market Reports.

The Markets.

SAN FRANCISCO, Dec. 17, 1896.

For the close of the year general business has held up remarkably well. Although the buying is for filling in, still the volume of goods going out shows an increase over the corresponding time last year. There is a steady growing feeling of confidence in mercantile and manufacturing circles, due to the promising outlook for the gold mining industry and farm products. Up to December 1st the acreage prepared and seeded to wheat in California is estimated to have been from 20 to 30 per cent larger than the entire season of 1895-96. The ground, owing to cold weather, was mellow and well pulverized, only requiring soaking rains to make the plant take on a good and substantial growth. These needed rains came at an opportune time; and, with favorable weather from now to harvest, this State's outturn of wheat will be the largest on record. This means more farming machinery and a large increase in the number of farm hands. After the turn of the year this favorable condition will make itself felt with machine and farm-implement manufacturers.

The local money market maintains that easy tone heretofore reported in this department notwithstanding the withdrawal of funds usual to the closing month of the year. Considerable money is still being remitted to the East for the purpose of meeting maturing obligations in next month. The heaviest shippers are large incorporated companies that have to pay interest on bonds. This withdrawal is hardly felt owing to so much idle money coming out and the knowledge that in January large sums of money will be disbursed for dividends and maturing interest.

Eastern money markets continue to work on easy lines. At New York there is a steady accumulation of funds owing to hoarded money still coming out for investment and also the sending of funds by New England banks to that city so as to avail themselves of the 2 per cent interest allowed by some of the banks to depositors. A drop in the market prices for industrial and railroad securities at New York has brought about a lessened demand for accommodations from speculative operators. There is a continued absence of a demand for gold to be sent to Europe which has a favorable influence.

New York Silver Prices.

NEW YORK, Dec. 17.—Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.
Friday	30	65⅜
Saturday	30	65⅜
Monday	30	65⅜
Tuesday	30	65⅜
Wednesday	30	65⅜
Thursday	30	65⅜

	Copper.	Lead.	Iron.	Tin.
Friday	11 35	3 00	11 00@13 00	12 00
Saturday	11 35	3 00	11 00@13 00	12 00
Monday	11 35	3 02½	11 00@13 00	12 85
Tuesday	11 35	3 02½	11 00@13 00	12 85
Wednesday	11 35	3 02½	11 00@13 00	12 85

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	7@8
Commercial Loans, prime	6@8
Call Loans, gilt edged	6@7
Call Loans, mixed securities	7@8
Mortgages, prime, taxes paid by lender	6@8
New York Sight Draft	10c Prem
New York Telegraphic Transfer	12½c Prem
London Bankers' 60 days	$4.84¼
London Merchants	$4.83¾
London Sight Bankers	$4.87½
Refined Silver, per oz., 1000 fine	65¼
Mexican Dollars	51⅜@52½

SILVER.—The markets at home and abroad strengthened on last Friday and held to strong prices throughout the week. The advance to 65⅜c an ounce fine at New York and to 30s at London was due to a better demand from India in consequence of a firmer Indian money market with higher rates of discount, imparting more strength to the India exchange. This improvement made it possible to allot India council bills at an advance to 1s 13-32d per rupee. This goes far to show that the available supplies of silver bullion are not large either in Europe or America and that the least improvement in the demand meets with stronger prices. In our market there is a fair export inquiry. After the holidays it is thought that this will become more pronounced.

The exports of silver from England to India, China and the Straits from January 1st to November 26th were:

	1896.	1895.	Changes
To India	£4,235,278	£3,385,695	Inc. £849,583
To China	721,385	1,630,023	Dec. 908,638
To Straits	642,896	704,453	Dec. 61,557
Totals	£5,599,559	£5,720,171	Dec. £120,612

New York silver shipments from Nov. 27th to Dec. 9th were as follows:

Steamer New York, Dec. 9th, 446,000 ozs. Shipped by: Heidelbach, Ickelheimer & Co., 180,000 ounces; M. Guggenheim's Sons, 165,000; Fuller & Wilson, 60,000; Muller, Schall & Co., 25,000; Lewisohn Bros., 16,000.

Steamship Trave, Dec. 8th, 235,000 ounces and 15,000 Mexican dollars. Shipped by: Zimmerman & Forshay, 125,000 ounces; Fuller & Wilson, 60,000; Handy & Harman, 50,000 ozs. and 15,000 Mexican dollars.

Steamship Campania, Dec. 5th, 637,000 ozs. and 50,000 Mexican dollars. Shipped by: J. & W. Seligman & Co., 300,000 ounces; M. Guggenheim's Sons, 170,000: Handy & Harman, 75,000; Zimmerman & Forshay, 50,000 ounces and 50,000 Mexican dollars: Muller, Schall & Co., 25,000 ounces; Lewisohn Bros, 17,000 ozs.

Steamship St. Paul, Dec. 2nd, 300,000 ounces of silver and 15,000 Mexican dollars shipped by M. Guggenheim's Sons, 140,000 ounces; J. & W. Seligman & Co., 110,000, and Zimmerman & Forshay, 50,000 ounces and 15,000 Mexican dollars.

Steamship Havel, Dec. 1st, 390,000 ounces; Heidelbach, Ickelheimer & Co., 180,000 ounces; Handy & Harman, 100,000 ounces and 20,000 Mexican dollars; Zimmerman & Forshay, 75,000 ounces and 25,000 Mexican dollars; Fuller & Wilson, 35,000 ounces.

Steamship Etruria, Nov. 27, 683,000 ounces and 40,000 Mexican dollars shipped by Handy & Harman, 300,000 ounces and 15,000 Mexican dollars; J. & W. Seligman & Co., 160,000 ounces; M. Guggenheim's Sons, 120,000; Fuller & Wilson, 50,000; Zimmerman & Forshay, 30,000 and 25,000 Mexican dollars and Lewisohn Bros., 23,000 ounces.

MEXICAN DOLLARS.—The market is fairly firm with a good inquiry reported. Eastern advices report continued fair shipments abroad. London mail advices state that the demand was good, but supplies had not come forward very freely.

QUICKSILVER. — The market holds to steady prices.

The market is quoted as follows:

Domestic trade, per flask	36 50

For export, quotations are nominal but less than for home.

COPPER.—Our market is practically unchanged. At the East spot is quiet, but futures are strong. A New York correspondent, a recognized authority, writes: "The volume of business for the month of November was large, and we estimate the transactions in the aggregate at from 30,000,000 to 35,000,000 pounds of the various grades, including about 15,000,000 pounds sold by the Calumet & Hecla Company, most of the latter having been taken by home manufacturers. A noticeable feature has been the scarcity of casting copper and the high prices obtainable for this variety. The demand for casting brands has become so great that makers have been unable to meet it, and some consumers have bought largely of Lake copper as a substitute at about the same price quoted for casting. Much of the raw material hitherto available for smelters is now converted into electrolytic copper, for the sake of saving the silver contents, which has resulted in almost obliterating the output of casting copper. The market for this grade advanced as high as 11¼c for the best brands. There have been some purchases of foreign copper for American account, part of which has already arrived to meet this demand. With better trade in this country, consumption will undoubtedly improve greatly, and, in that event, exports should naturally show a material falling off next year, as it cannot be expected that the surplus available for shipment to Europe next year will equal that sent abroad during 1896.

Ingot, jobbing	14¼	@	—
Ingot, wholesale	13½	@	—
Sheet copper	17	@	—
Bolt	¼ & 5-16, 20c; ⅜ and larger, 17c		
Lake Superior Sheathing	20		

LEAD.—In sympathy with the East the market is firmer. A speculative inquiry is reported at New York.

Pig	—	@	3 75
Bar	—	@	4 00
Sheet	—	@	5 25
Pipe	—	@	4 50

SHOT.—There is a good seasonable deanmd. Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 20
Drop, B and larger sizes, " "	1 45
Buck, Balls and Chilled, do, " "	1 45

ANTIMONY.—Our market is quoted at 7½ @8c in a jobbing way. New York mail advices quote 7½c for Cookson's, 6½@6¾c for Hallett's and 6½c for Japanese.

BORAX.—The market is firm with producers not taking orders at quotations for less than carload lots.

The market is quoted as follows:

Refined, in car lots	5
Refined, in sacks	4¾
Powdered, in car lots	4¼
Concentrated, "	5

TIN.—There is nothing new to report either in our market or at the East.

Pig, per lb	14¼c	@	—
Plate, I C coke, heavy, per box	—	@	$4 05
" " " light, "	—	@	3 95

IRON.—Business in our market runs along on lines usual to the closing of the year. The demand for pig next year is expected to enlarge. At the East the markets are somewhat unsettled, owing to the uncertainty as to the steel billet pool. The output of furnacemen shows an increase. A late exchange says that there is a very large foreign demand for Alabama pig iron, amounting of late to about 20% less than the monthly capacity of the Tennessee Coal and Iron Co. The Atlanta, Georgia, *Journal* says that several mines and manufactories in Alabama have opened since election, and the most promising feature is the foreign demand for both Alabama and Tennessee iron. Present orders indicate that 1897 will be the banner year for exports of Southern pig iron.

AMERICAN.

Mining Share Market.

SAN FRANCISCO, Dec. 17, 1896.

The heavy and dull market reported last week continued to rule to Monday when a steadier feeling set in with Hale & Norcross developing strength. The firmness in the latter was brought about by some outside buying, and as the shares were in light supply an advancing tendency was easily established, which induces other buyers to come in when prices soon moved to over $1 a share. This improvement was felt by both Chollar and Potosi on reports that the south drift in the Brunswick workings improved towards Potosi. The true reason for buying Hale & Norcross is, as yet, somewhat of a mystery. There are several assigned, one is that those now in management fear they will loose control at the next election and are in the market as buyers of the shares, another is that the buyers believe that the Supreme Court will decide the lawsuit in favor of the company and still another that when active exploiting is down on the 1100-foot level, Comstock workings, good to high grade ore will be discovered. While one or all of the above reasons may prove correct yet to an outsider it looks as if there are some shorts on the shares due to the levying of a 25-cent assessment, the temporary stopping of work on the Comstock and that the company will, unless ore is found by the other companies working on the Brunswick lode, do no more work on the latter lode. The lawsuit will come up before the Supreme court either in January or February. The strength of the market and a sharp advance yesterday in the middle mine shares, shows it to be quite sensitive and speedily responds to buying orders. So far the movement does not look as if strong moneyed men are in the market, but it does show that there is a scarcity of shares. There is no doubt that values were driven to lower figures than the work in the mines both on the Brunswick and Comstock lodes warrant from a gambling point of view, but from an investment standpoint some were quite high enough. Quite a number of assessments are to be levied before long, including one on Chollar.

From the Brunswick lode our advices note fairly active exploiting in Occidental, with no particular change in the material run through. In Chollar they are still driving the two crossdrifts on the 400-foot level to the east. The south drift is being run so as to make it a crossdrift for the purpose of striking the downward continuation of the ore found above. In the Hale & Norcross shaft a station has been cut out on the 500-foot level, but it is hardly likely that a south drift will be commenced by Chollar until after Christmas. The company will have to run it at least 250 feet before it is possible to start crossdrifts. This will carry it well into February. Savage has stopped work on the 300-foot level and taken up the north drift run by Hale & Norcross to its line on the 400-foot level. The work on this level will be closely watched by mining men. The usual work is being done by Gould & Curry. Best & Belcher is running an east crossdrift at a point 152 feet from the boundary on the tunnel level.

From the Comstock lode our advices continue to report more or less work in the leading mines, but, from all that can be learned, not with the expectation of showing up ore. In Sierra Nevada they have stopped the east crossdrift in the Layton tunnel and resumed work in the west crossdrift. In Union they are still driving ahead, but slowly, also one of the lateral drifts on the 800-foot level and another from an upraise above this level. The west crossdrift on the 1000-foot Mexican level continues to pass through clay seams and lines of quartz. Similar formation is being passed through by Ophir's west crossdrift on the same level. On the Central tunnel Ophir is driving ahead two south drifts. One was, at last mail advices, in old fillings while the other was in low-grade quartz. In Andes they are running two crossdrifts. In Con. Virginia more active exploiting seems to be the order on the 1000-foot level. They are still raising from the east crossdrift on the 1650-foot level. Active lead and exploiting work is being done on the 1750-foot level. Only twenty-four tons of ore were extracted last week. The company milled 384 tons of ore, the battery assays averaged $30.15 per ton. Best & Belcher and Gould & Curry are still driving ahead the joint east crossdrift from the 800-foot level of the Bonner shaft. They do not get out of porphyry. In Savage the work is the same as reported last week. In Bullion they are still driving the north drift ahead. In Alpha the work is confined to the 500-foot level. The

work in Confidence, Challenge and Con. Imperial is the same as heretofore reported. Nothing comes to hand from Yellow Jacket. Fairly active work is being done by Crown Point on levels published last week. Belcher milled some ore which gave a bullion return of $89.69. They are still extracting a few tons of ore each week. In Overman they are working on the 900-foot level.

THE OVERLAND LIMITED, VIA UNION PACIFIC.

Only 3 1-2 Days to Chicago-----3 1-2.
Only 4 1-2 Days to New York---4 1-2.

The Union Pacific is the only line running Pullman double Drawing-Room sleepers and Dining Cars San Francisco to Chicago daily without change. Only one change to New York; dining car service entire distance. Vestibuled composite buffet smoking and library cars between Odgen and Chicago.

The only line running upholstered Pullman Tourist sleepers San Francisco to Chicago daily without change, and personally conducted excursions to St. Paul and Chicago without change, leaving San Francisco every Friday.

Tickets and sleeping-car reservations at No. 1 Montgomery St. Steamship tickets on sale to and from all points in Europe. D. W. HITCHCOCK, General Agent, San Francisco.

ANNUAL MEETING.—The Regular Annual Meeting of the stockholders of the Gould & Curry Silver Mining Company will be held at the office of the Company, Room No. 69, Nevada Block, No. 309 Montgomery street, San Francisco, California, on MONDAY, the 21st day of December, 1896, at the hour of 1 o'clock P. M. for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such other business as may come before the meeting. Transfer books will close on Friday, December 18, at 3 o'clock P. M.

ALFRED K. DURBROW, Secretary.

ANNUAL MEETING.—The Regular Annual Meeting of the stockholders of the Thorpe Mining Company will be held at the office of the Company, Room No. 44, Phelan Building, San Francisco, California, on WEDNESDAY, the 30th day of December, 1896, at the hour of 1 o'clock P. M., for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such other business as may come before the meeting. Transfer books will close on Monday, December 28th, at 3 o'clock P. M.

A. F. FREY, Secretary.

PROMOTER WANTED.

For a great mining enterprise. New region, Cascade mountains, Pacific coast. Extensive deposits of copper ores, containing gold and silver. Red Cripple Creek gold ore. Best discoveries secured by numerous claims, and opened; their value is a fact. Timber, water powers, coals and fireclay in abundance. A rare opportunity for an enterprising, moneyed and influential man. Partnership desired. References given and expected. Address "Promoter," this paper.

WANTED.

A Large Gold or Copper Property, located anywhere from Alaska to Mexico. Must have ore body developed 200 to 300 feet deep, with a large amount of payable ore actually in sight. Or a property with a large body of payable ore exposed sufficient to warant extensive development work. No small property wanted. Send complete description to M. KUHN, 12 Front St., San Francisco.

WANTED,

A position as Superintendent or Assistant Superintendent in copper-silver or silver-lead smelting works.

Understands mining, sampling, assaying, furnace management, handling men.

Prefer Mexico or Spanish South America. Speaks Spanish. Best references.

Address METALLURGIST, this office.

Assessment Notices.

OCCIDENTAL CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Silver Star mining district, Storey county, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 24th day of November, 1896, an assessment (No. 25) of fifteen (15) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 29th day of December, 1896, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 18th day of January, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office—Room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

JAMISON MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, on Jamison Creek, near Johnsville, Plumas County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 27th day of November, 1896, an assessment (No. 9) of five cents (5c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 120 Sutter street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 28th day of January, 1897, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 22nd day of March, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

SAM'L W. CHEYNEY, Secretary.

Office—Room 50, 120 Sutter street, San Francisco, California.

CON. CALIFORNIA AND VIRGINIA MINING Company.—Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 8th day of December, 1896, an assessment (No. 7), of 25 cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, Room No. 29, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 14th day of January, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the 4th day of February, 1897, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

A. W. HAVENS, Secretary.

Office—Room No. 29, Nevada Block, No. 309 Montgomery street, San Francisco, California.

HALE & NORCROSS SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey County, State of Nevada.

Notice is hereby given that at a meeting of the Board of Directors held on the 8th day of December, 1896, an assessment (No. 110) of 25 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 3, No. 331 Pine street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on MONDAY, the 11th day of January, 1897, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 1st day of February, 1897, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

R. U. COLLINS, Secretary.

Office—Room 3, Stock Exchange building, No. 331 Pine street, San Francisco, California.

GOULD & CURRY SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees, held on the 14th day of December, 1896, an assessment (No. 80) of 15 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 69, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 19th day of January, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on TUESDAY, the 9th day of February, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Trustees.

ALFRED K. DURBROW, Secretary.

Office—Room 69, Nevada Block, 309 Montgomery St., San Francisco, California.

THORPE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Fourth Crossing, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 14th day of October, 1896, an assessment (No. 4) of 5 cents per share was levied upon the issued capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 567 Market street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 12th day of December, 1896, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 9th day of January, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. F. FREY, Secretary.

Office—No. 567 Market street, San Francisco, California.

POSTPONEMENT.

The date of the delinquency of the above assessment is hereby postponed to the 22nd day of December, 1896, by order of the Board of Directors.

A. F. FREY, Secretary.

Room 44, Phelan building, San Francisco, California.

COLORADO'S GOLD FIELDS.

Millions Upon Millions of Dollars in Gold Have Been Added to the World's Wealth.

It is a well-known fact that the richest and most famous gold mines in the known world are those of Colorado, many of which are paying to fortunate investors millions of dollars annually in dividends. Some shrewd persons who invested only a few dollars are now receiving hundreds and thousands in profits, and, judging from present indications, there are more desirable chances to invest just now than ever before. New mines are discovered daily and old ones strike richer veins of gold.

In order to meet the great demand for reliable information about mines and mining camps, one of Denver's oldest and best known publishers has just issued a handsomely illustrated book accurately describing every mining camp in the entire State of Colorado, giving scores of truthful photo-engravings of famous mines, mountains, cities, etc. Cripple Creek, the world's wonder, is fully described; also a correct map of the district. Narratives of how many poor people have become wealthy by judicious investments in gold mines, and sketches of former prospectors who are now fixed for life. Tells how to avoid unscrupulous brokers and sharpers. The volume has been carefully compiled by a disinterested author and every statement made is guaranteed to be true. All terms and phrases of miners fully explained; tables showing the State's production of gold and silver for 35 years past. The publisher will send by return mail a copy of the above great book upon receipt of $1 (currency or stamps), which also includes a full-paid yearly subscription to his big 56-column weekly family paper, the *Illustrated Sentinel*, of Denver, Colorado (established 1890). Clubs of 6 and six books, $5. The paper contains each week all the latest mining news and illustrations of Rocky mountain scenery, also true stories of love and adventure.

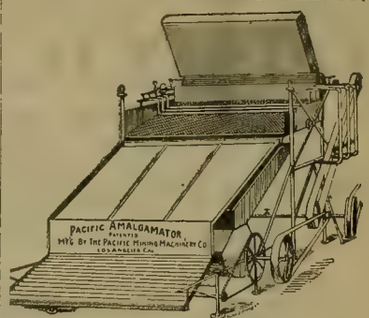
THE PACIFIC AMALGAMATOR



MILL OR PLACER.

A Guarantee With Each Machine.

This machine is the finest gold saver for both placer mines and quartz mills. No other plate necessary in mills where the Pacific Amalgamator is used. It is constructed almost entirely of metal; it can be transported on pack train. Possesses a large amount of silvered amalgamating plate surface. No scouring of amalgam. Any ordinary amalgamator can operate the machine with good success. Send for catalogue.

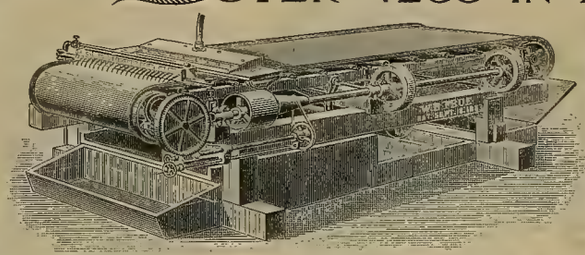
FRUE ORE CONCENTRATOR.

OVER 4200 IN ACTUAL USE.

Manufactured under Patents of
April 27, 1880;
September 18, 1883;
July 24, 1888;
March 31, 1891.
July 18, 1893.



It can be safely stated, without going into a description of several new and untried concentrators that have lately come into the market, that where sulphurets are of such value as to make close saving necessary, the Frue Vanner is always used. It is the only endless belt concentrator in the market that can be relied on to handle all classes of ores, and give universal satisfaction. (In all competition of concentrators the Frue Vanner is taken as the standard machine of the world and all comparisons made by it. There have been over 4200 of these machines sold, 1700 having been sold on the Pacific coast alone.) They are in use in every part of the world where mining is carried on and in all cases they are giving perfect satisfaction. From time to time valuable and important improvements have been made in this machine to increase its capacity and durability, and particular attention is called to the Patent Lip Flange for the rubber belt, which does away with nearly all the strain and cracking, as in the old style of flange, making the life of belt more than double that of other style belts in the market. The lip of flange bends outward in going over the large end rolls, thereby distributing the strain in the solid rubber, and bringing virtually no strain either at the edge or at the base of flange, as is the case in all belts with a raised edge.

For any information, pamphlets, circulars or testimonials, call on or address

MINING AND SCIENTIFIC PRESS.

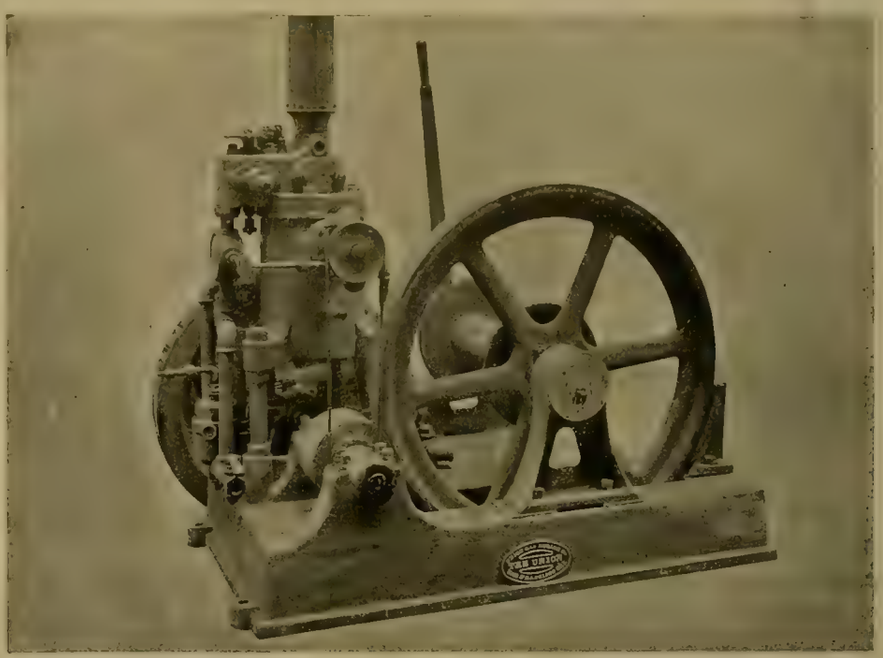
AND PACIFIC ELECTRICAL REVIEW.

No. 1903.—VOLUME LXXIII. Number 26. SAN FRANCISCO, SATURDAY, DECEMBER 26, 1896. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

For Mine and Marine Work.

On this page are illustrations of two devices manufactured by the Union Gas Engine Co. of this city. The upper one shows a 4-H. P. single drum prospecting hoist, driven by friction. Its builders say it can be operated on gasoline, benzine, distillate or kerosene. The quantity of fuel used depends upon the amount of work being done. Hoisting is intermittent work and a sensitive governor becomes indispensable for economical working. This hoist is equipped with such a governor. It will lift 1000 pounds 100 ft. per minute.

The lower cut represents an oil engine with hoist and windlass combined on iron base. This outfit is intended to meet all the wants in the line of hoisting of 50 or 60-ton vessels. The engine is 4-H. P., fitted to run on gasoline, benzine, distillate or kerosene. The cargo drum runs thirty-seven revolutions per minute, capable of lifting 1000 pounds 100 ft. per minute; the windlass running eight revolutions per minute can lift 6000 pounds 16 ft. per minute. The shaft carrying cargo drum also has a gypsey which runs at same speed as the drum and is intended for hoisting sails or cargo. The windlass has a gypsey on each end for hoisting heavy cargoes and warping ship, and two wildcats for hoisting anchors. When the windlass is not in use it can be thrown out of gear by a small lever—shown in the cut. It is all made for hard work and occupies a space of 4x5 ft.

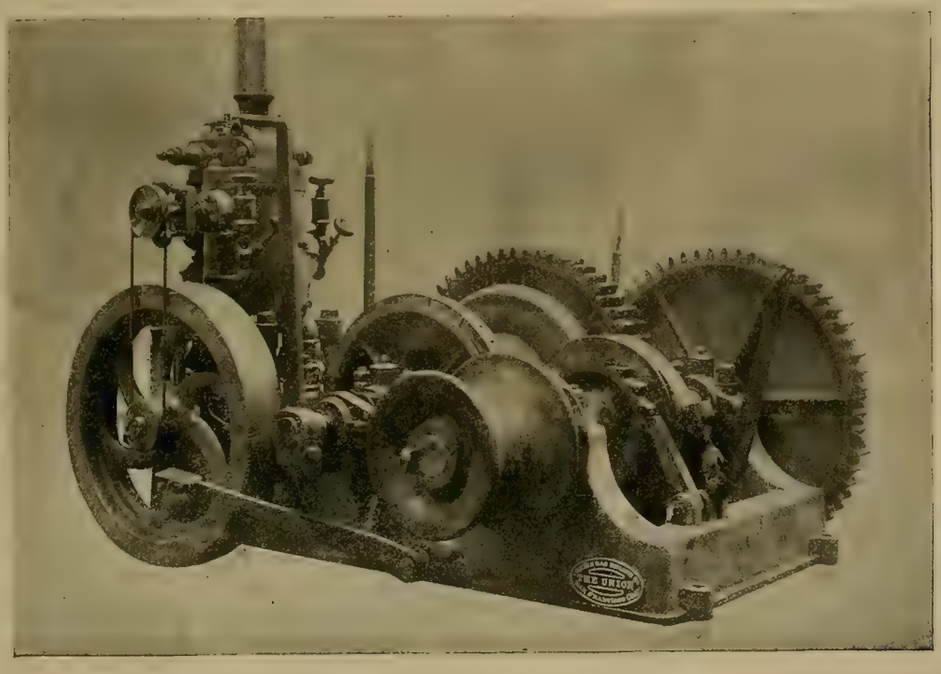


FOUR HORSE POWER SINGLE DRUM PROSPECTING ENGINE.

Careless Milling.

No one can look about through the mills of California without being struck with the excellence and merit of some and the shocking deficiencies of methods and practice in others. The majority of the millmen have grown old in the service. From a variety of reasons it happens that many mine managers have neither theoretical nor practical knowledge of milling, and trust implicitly in the revered wisdom of their millman. Henry Louis, in the preface to his work, says: "It is not too much to say that not one manager in ten knows how much gold he is losing in the mill. What he is getting is really a secondary question, and this, the fault in the first instance of an imperfectly trained millman, renders it impossible to detect the shortcomings of the latter, whose very incapacity thus serves as its own shield." And so it comes about that the State which taught the world how to mill gold ore, and which contains to-day perhaps the most instructive examples to be found of its practice, still moves so largely in the ruts of a bygone time and allows much of the gold drawn from its veins to run to waste in its gulches and rivers. Experience has taught how easy it always is to lose gold, how difficult sometimes to save it. One often meets some self-complacent director who tells how ridiculously little gold there is in the tailings from their mill, and how they do not need any assayer, for their foreman, or superintendent, or millman, or some other venerable prodigy always tests everything in the pan, at which the experience of forty years has taught him a superhuman cunning.

The cause of the failure of many mining enterprises in all parts of the world have been from losses of this kind. A careful examination of a property and estimate of cost may be made that will show that it will pay a certain profit. The costs may bear out the correctness of the estimates and the assays of the ore taken out may show that the report on the ore bodies was correct, yet leaks will creep in that make the difference between a profit and a loss.



OIL ENGINE WITH HOIST AND WINDLASS COMBINED.

The Railroad's Methods.

According to reports from different parts of the State as to the work being done by the Southern Pacific Company in its haste to forestall the effects of the proposed Mineral Land Bill now before Congress, they are not over-particular about using the fairest means. Near Oro Fino, in Siskiyou county, some of the notices calling upon the owners of mines that have been worked for years to appear at Redding and show cause why the sections upon which they were posted should not be patented to the Southern Pacific Company, were put up on trees some distance from the road out on the side of the trees furthest from it. The law states that these notices shall be posted in conspicuous places.

Coast Industrial Notes; Recently Declared Mining Dividends; Recent California Mining Incorporations; Personal; Commercial Paragraphs, 530. List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents, 534. Index to Volume LXXIII, 539-540.

THERE were 20,630 papers described in the issue of the American Newspaper Directory for 1896. Of these, 17,650 are credited with issuing less than 1000 copies each. Of the remaining 2,980, but one mining paper published its exact circulation in plain figures. That one was the MINING AND SCIENTIFIC PRESS. These facts (which are furnished by the proprietors of the American Newspaper Directory) are commended to the attention of intelligent advertisers, who want their business announcements read by customers, instead of competitors.

Australia and Cyanide Patents.

The Australian governments take a very paternal interest in the development of mining. The colony of New South Wales offers a reward of £500 for the discovery of any new gold field. A bill has been drafted by the Minister of Mines of Victoria providing for the expenditure of £140,000 to assist in the development of mining. The money is to be expended in sinking shafts and other such work provided that the companies receiving assistance expend as much. In all the colonies are departments of the Government whose business it is to look out for the industry.

In a late issue the Australian *Mining Standard* calls upon the Government of Victoria to follow an example set by New Zealand and take steps to determine the question of novelty or no novelty in the MacArthur-Forrest cyanide patent and not to leave that to be fought out by private individuals. Considering that the patents have been granted by the governments named to the MacArthur-Forrest people this would hardly seem fair. Some consideration, too, should be given to them for the good work done in introducing a process that has saved those countries millions in gold. In those countries, however, patents are granted upon application without examination as to their novelty and without guarantee of novelty. So in England and France where all patents must be labeled "Without Guarantee of the Government."

In the United States patents are not granted until careful examination has been made as to novelty in the Patent Office. This does not mean that this Government guarantees the novelty of the inventions, but it is a precaution that saves the public at large much money that would otherwise be paid for patents on old discoveries and largely reduces the number of lawsuits in regard to inventions.

A New System for Swindling Investors.

In the issue of the MINING AND SCIENTIFIC PRESS of December 12th mention was made of a novel method for raising capital for mining ventures, which was characterized as a scheme for robbing the unwary. It was described as follows: "A Western mining company wanted $40,000 to develop its plant. To obtain this it issued stock for $200,000, on which a dividend of 8 per cent was guaranteed for ten years. The guarantee was made through a Chicago bank, the stock being sold at par. The bank held 80 per cent of the amount received for stock, or in all $160,000, remitting to its client — the mining company—the $40,000 required for the development of the mine. In this manner the annual guaranteed dividends were assured of payment. The mining company received the value it had placed on its shares, the subscribers were protected against loss of more than 20 per cent of their investment, with the possibility of a proportionate share of the profits if the venture turned out well; and the bank making the deal had the advantage of the use of the money during the ten years the guarantee remained in force." That was the way in which the scheme was described in a number of newspapers that come to us. It seemed such a palpable swindle that it was characterized as such in these columns. Now a letter has been received from Chicago which is as follows:

In your issue of Dec. 12th, 1896, page 479, middle column, second item from the bottom, referring to a scheme for robbing investors, lately being worked in Chicago as a mining investment, etc., if a mining company have a property requiring development, and which, with the development, can be made a good dividend-paying property, and if such a company has among its officers men of standing in the community, and if the bank which guarantees the dividends as referred to in your article, and the money raised for the treasury is honestly and judiciously expended in the development of the property, will you kindly inform me in what way this could be really called an illegitimate mining proposition?

As a matter of fact, there is only one way in which the proposition could be looked upon as illegitimate, and that is in the event of the company making this offer being a dishonest one and intending to appropriate their portion of the money raised for their personal use. Otherwise it strikes me as being a very reasonable proposition, as the investor cannot lose more than 20 per cent of his original investment besides the interest. There are many properties that $40,000 would not put on a paying basis.

I write this frankly and candidly to you, not that I am interested in such a proposition, but I had heard of a similar proposition, and personally knew that the bank which guaranteed these payments was a well-known institution of this city, which could ill afford to lend its name to any scheme, no matter how meritorious it might appear to be on paper, if they were not perfectly satisfied that it was a worthy proposition and in the hands of good people.

It is possible that there may be some good reason for referring to such a scheme in the manner you did. If so, I would like to know very much what it is.

I will greatly appreciate your reply.

Yours truly, HONEST ENQUIRER.

If there is any way of explaining that this scheme is not a swindle we should like to know it.

Of course it may be claimed that the investors have a chance to make something out of the mine, but if so why not ask for $40,000 only and let them put their $160,000 in savings banks or invest it in other mines.

The whole proposition boiled down means this: A has a mine worth nothing. B gives to C $200,000, of which $40,000 is to be paid to A to be used in prospecting. The rest, $160,000, is to be paid back to B at the rate of $16,000 a year.

A capital of $200,000 is raised, but only $40,000 goes into the mine. Is the mine worth nothing but prospecting? If so the $200,000 capitalization is a swindle.

Those who put up the $200,000 lose the interest on $160,000 and probably absolutely lose the $40,000. The bank handles the money simply and has the use of it for the time. The mine owner will probably make something out of the $40,000, but it seems a pity that one who could take in people in such a scheme should be content with the meagre pickings out of $40,000.

Truly, any way it may be looked at, it is such a bold swindle that it seems impossible that Chicago people could be taken in by it.

The Proposed Laws as to Mining Locations.

The proposed laws offered in November by the MINING AND SCIENTIFIC PRESS for adoption by the California Legislature have called the attention of mining men in other States and Territories to needs for reform in their laws. In the Black Hills it is proposed to have laws passed compelling all locators to sink 10 feet, or run drift that will be equivalent, and to have claims surveyed by United States deputy mineral surveyors. These points were suggested by the laws we proposed, and the fact that miners in other parts of the West ask for legislation on the same lines, is as strong an argument as can be presented in their favor.

In this connection a correspondent of the Black Hills *Mining Review* writes:

As the law now stands, there is no limit to the number of claims a person can locate and hold for a period of two years at a cost of $1 each. When the two years have expired, the ground is relocated at the same cost as before, and held for two years more, and the same process can be continued indefinitely. There are hundreds of fair prospecting claims in Custer and Pennington counties that have been held by the same individuals for ten or fifteen years, and in some cases for a longer time, and in many instances not $5 worth of work has been done. Were these individuals compelled to do a reasonable amount of work, and have their claims surveyed before a record could be made, there would be from ten to fifteen thousand claims in Pennington and Custer counties opened up to men who would develop them. At the present time the Harney Peak Tin Company is holding something like 1000 claims by the relocation and leadpencil process. Their plan of operation is as follows: A few days before the first of January each year, they hire a few men to go on their claims, throw out a few shovelfuls of dirt, and freshen up the old workings, and when the first of the year comes around they relocate. There are many individuals in Pennington and Custer counties who have from ten to 100 and more claims each. If these claims were thrown open to the public, nearly all of them would be prospected, and very probably many good finds would be made.

Another advantage in having a law of this kind would be to reduce the number of lawsuits to the minimum. A great many people have often wondered why we never have any stampedes in the Hills as other mining countries have. The reason is, Tom Jones makes a good find, locates say a group of ten claims, he then informs his friends, Smith, Brown, Johnson and Ole Olson; each of them take from five to twenty claims, and by the time the public learns of Jones' find every piece of ground within three miles of it is taken up. Of course no prospector will go on another man's ground to prospect; the people who own the ground have too much ground to prospect it as it should be done, therefore three-fourths of the mining ground of the Black Hills is unprospected, and will remain so as long as the law remains as it is. If the laws were changed as proposed there would be thousands of miners at work in the Black Hills where there are now hundreds.

Mines and Railroads.

Much of Colorado's great mineral wealth would not have been developed but for the railroads which have been run into the new districts. The fact that most of the ores are refractory has made railroads a necessity in order to bring the products of the mines to the smelters. In British Columbia railroads are being rapidly built into the mining districts. One result of this will be the working of ores of a grade too low to be worked at the present time owing to the cost of transportation.

Both Colorado and British Columbia are fortunate in having the advantages of railway competition. California and Nevada are not as well favored in this respect. The Southern Pacific has not only refrained from building branches, but has done all in its power to prevent others, and has generally been successful. Now a stimulus seems to have been given to the building of roads into comparatively undeveloped districts for the trade that may be secured in time.

This will mean a great deal to both States and especially to Nevada. In connection with the Sierra Pacific Railroad projected to run out of Stockton into the mining country along the mother lode it is proposed to run electric roads between some of the mining towns and as feeders to the steam road. There are other parts of California that could take advantage of the abundance of available water power to build the electric road to the main lines of railway and secure low rates of transportation.

Concentrates.

A NEWSPAPER has been started at Randsburg—the Randsburg *Miner*.

A NUGGET worth $1,000 was found last week in the placers at Osceola, Nevada.

THE town of Kaslo, B. C., will be lighted by electricity by the first of the new year.

To date, the Centennial-Eureka mine, Tintic, Utah, has paid dividends aggregating $1,920,000.

THERE is proposed a duty on silver to amount to the difference between the market and mint prices.

THERE is reported a discovery of a mineral paint mine in the Temescal mountains in San Bernardino, Cal.

THE newly formed Spokane, Wash., Stock Exchange expects to be ready for business by the first of the new year.

ON pages 522 and 526 of this issue the new camp of Randsburg is reported from the standpoint of a practical miner.

AT the Banner mine in Butte county, Cal., new machinery to cost $50,000 will be put in soon to more fully develop the property.

A COUNT of tents and buildings in Randsburg, Kern county, last week, showed 280, and an estimate of population placed it at 1150.

A PROSPECTUS published in London asks for purchasers for shares in the Vulture mine, of Arizona, capitalized for $1,800,000.

B. A. CARDWELL, who has bonded several mines in Meadow Lake, Cal., district, proposes to build a wagon road to the railroad at Truckee.

THE town of Columbia, Tuolumne county, will in a few days be lighted up by electricity from the Electric Light and Power Company's plant.

A CLEANUP in a placer claim near Johnstown, Lyon county, Nevada, the work of three men 16 days, yielded $365, or nearly $8 a day to the man.

AT Taylor & Crow's mine, in Galice creek, Southern Oregon, four men can mortar out from the richer rock $500 to $600 a day, according to a local paper.

THE Tuolumne Power Company has shipped in supplies and begun work at Jacksonville, Cal., on a ditch to divert the waters of the Tuolumne river for power purposes.

THE Victorian Gold Estates, Limited, of London, has a concession from the Australian colony of the same name of 9000 acres of gravel mining property in the Ballarat district.

A MINING company has been organized at Marlow, Oklahoma, with a capital of $500,000 to work lately discovered gold mines on Otter Creek on the north side of the Wichita mountains.

NORTHERN GEORGIA claims that '97 will show a great gold development therein. Georgians assert that all needed there are plenty captail and modern methods of treating the ore.

THE Union Hill Mill and Mining Company, of the Black Hills, South Dakota, has let contracts for the erection of a smelting plant of 200 tons daily capacity, that will cost nearly $300,000.

QUIGLEY & MULLEN, wholesale grocers of Wilmington, Del., have failed for $71,000, through financial difficulties caused by the troubles of the Golden Scepter Mining Company, at Granite, Montana.

AN English syndicate is reported to be considering the purchase of the De Moon ground, above North Bloomfield, Cal., adjoining the old Derbec. It is proposed to run a long tunnel to tap the gravel.

A DISPATCH from Seattle, Wash., announces that Dennis Ryan, a capitalist of St. Paul, and associates, have purchased for $250,000 a controlling interest in the Bonanza mine, in the Silverton district.

THE heavy and early rains are helping out the hydraulic miners in the northern counties of the State and giving them a long season's run. This promises a large output of gold from Siskiyou and Trinity.

THE various cyanide plants on the Rand in South Africa have a gross capacity for treating over 20,000 tons of slimes per month and they have on hand tailings, slimes, etc., amounting to over 1,500,000 tons.

DURING the past few weeks the number of affidavits as to labor performed on mineral locations that have been filed has far exceeded the number of location notices. The first week in January will reverse this.

COAL from the recent discovery south of Columbus, Esmeralda county, Nevada, is being used for domestic purposes and proves to be of good quality. Investigations tend to show that the deposits are large.

A CONTRACT has been let at Nevada City to sink an incline 500 feet in the Millikin Ranch mine at the rate of $2.35 per foot. The incline is already down 110 feet. The ground to be run through is earth and gravel.

"THE inventor of the chlorination process," is reported by local papers to be visiting Cripple Creek, Colo. This is a little hard on the memory of Prof. Plattner and the late Mr. Deetken of Auburn, Cal.

ENGLISH capitalists have put men at work prospecting the Adelaide copper mine near Golconda, Nevada, to determine its value. If expectations are realized, it is expected that there will soon be 300 men employed.

THE Anaconda company owns over 100 locations at Butte, Montana, and has expended over $80,000,000 since 1881. An average of 2500 men are employed. The output of copper for 1896 is estimated at 130,000,000 pounds.

IN Montana the Northern Pacific is patenting a large amount of mineral land. Owing to a neglect on the part of the people, the spirit of the law under which the Commissioners were appointed is not being carried out.

THE educational institutions of Montana hold 9,000 square miles of land. The minimum price at which these lands may be sold is $10 per acre. None of the principal from the sale of these lands may be expended but only the interest used.

WHILE excavating for a tunnel on the Alum Rock Railway, seven miles from San Jose, several small veins of coal were discovered last week, and it is probable that borings will be made to discover, if possible, if larger bodies do not lie further down.

THE mines of British Columbia have made a large output of bullion during the past year. Most of it comes from high-grade ores, the only class that will pay the heavy costs of mining and shipping. There remain untouched immensely larger bodies of lower grade ores that will in time be worked as the costs are reduced. That the gold, under the circumstances, has been so large gives promise of a splendid future for these mines.

H. S. GILLETTE and Calvin I. Brown have purchased five mines in the Beveridge district, near Independence, Inyo county, Cal., and will erect a mill. The ores are high grade, but have heretofore been packed out on mules at a cost of $12 a ton.

THE Enterprise group of mines on Ten Mile creek in the Slocan, B. C., have been bonded to D. M. Hyman and others of Colorado for $300,000. The first payment of $50,000 has been paid, $100,000 is to be paid on May 1, and the balance, $150,000, to be paid on July 1.

THE Bonanza mine in the Baker City district, Oregon, was offered a short time ago for $15,000. The owners, however, erected a mill on it, made a twenty days run and cleaned up $15,000 and now state that they have in sight 300,000 tons of ore that will mill over $10.

GOVERNOR FRANKLIN, of Arizona, places the value of the mineral output, gold, silver, lead, copper and limestone, of that territory for the last fiscal year at $13,978,233.20. Considering that the territory has a population of less than 100,000, a large proportion of which is engaged in other industries, this is a very good showing.

NUMEROUS comments and suggestions are received regarding the proposed Cabinet Secretaryship of Mines. The Santa Fe *New Mexican* proposes that the present Department of Agriculture be abolished, and in place thereof a Department of Industry be created, with Bureaus of Agriculture and Mining and Manufacturing.

THE Mammoth mine at Tintic, Utah, which has paid in dividends $1,150,000, has attracted the attention of foreign investors a number of times of late and now it is reported in Salt Lake that a controlling interest has been placed in escrow to be delivered on payment of $5 per share, or at the rate of $2,000,000 for the whole property, to a European syndicate.

IN Western Australia under the laws of the colony the holder of a mineral lease from the Government is bound to keep at least one man at work on each three acres included in the lease. Although a large number of miners have gone to the colony during the past two years, so many of them are prospecting or locating claims on their own account, that it is difficult for the leaseholders to find men to do the necessary work.

THE engineer of the Rio Tinto Copper Mining Company estimates that they have in their mines in sight 133,000,000 tons of ore, sufficient at the highest rate of output for any past year to supply sulphur and copper to meet the company's requirements for the next seventy years. This is independent of the remaining unexplored portion of the company's property. The company is in position to turn out steadily 30,000 tons of refined copper per annum.

A DEAL for the transfer of the Silver City and Northern Railroad with the coal lands owned by the company in the San Augustin plains in New Mexico to people representing the A., T. & S. F. R. R. Co. is underway. This, if carried out, says the Silver City *Enterprise*, will mean the extension of the road connecting the iron and copper mines of Santa Rita with the coal fields and will furnish cheap fuel for the reduction of large bodies of ore known to exist in these districts.

ACCORDING to the annual report of the State Mine Inspector of Dakota, for the year ending December 1, 1896, the total output of ore was valued at $6,178,675, and the number of miners employed was 1927, not including men engaged at the mills, smelters and other reduction works, and such other vocations above ground and directly connected with mining operations. This makes an average of $3100 worth of ore taken out per man. Yet many of them were engaged in prospecting and development work.

DREDGING for gold is being carried on in a systematic manner and with success in New Zealand. There are about 40 dredges at work in the South Island, and their average cost is at least $10,000 each, so that there is $400,000 invested in machinery alone for this class of mining. The number of men employed per dredge is about seven, making a total of 280, while the amount of gold obtained last year from the total number of dredges, it is said, reached at the lowest estimate 25,000 ozs., of a total value of $500,000.

MUCH may be said for the good work done by some of the newspapers published in the mining districts toward keeping the business on a legitimate basis. For example, the Angels, Calaveras, *Voice* has this to say of a case of over-capitalization: "The syndicate which bonded the Alabama mine has listed it in London for $600,000. This is an enormous value to place on a prospective mine. It is just such inflations which deter foreign capital from making investments with a view toward actual work, and which, consequently, leave so much good property unworked in this State."

THE idea among many people in the Old World that gold could be picked up in the streets of San Francisco was not so far wrong after all. A man in this city claims to have discovered in one of the public streets a 16-inch ledge from which the croppings assayed $15 a ton. Some years ago a contractor discovered cinnabar on a lot at the corner of McAllister and Devisadero. In 1888 the Mining Bureau assayed ore from the hillside on Liberty street that went $7 a ton. Then, manganese ore has been discovered in Guerrero street. But in all these cases property rights would prevent mining.

THE Montana Mining Company, better known as the Drum Lummon at Marysville, Montana, is about to erect a cyanide plant to work the large quantity of tailings on hand. This mine was a short time practically closed down as the ore bodies had pinched out. The company has paid in dividends $2,890,637. Although the best of machinery has been used, it is claimed that not over 85 per cent of the assay value of their ores have been saved in the mills. They have always made it a point to save its tailings by building dams and it is claimed that there is in these tailings $1,600,000 in gold. This will be the second cyanide plant in Montana and the first to work over old tailings.

THE report for October of Dwight B. Huntley, superintendent of the De Lamar Mining Company, of Idaho, gives the following figures: Number of tons crushed (wet), 4,238.18; number of tons crushed (dry), 3,822.87. Assay value of the pulp: Gold, $15.53; silver, $5.01; total, $20.54. Assay value of the tailings: Gold, $4 69; silver, $1.24; total, $5.93. Percentage saved, total, 71.13; number of of Dore bars produced, 15; number of ozs. pure gold produced, 1,872.9125; number of ozs. fine silver produced, 29,395.27. Value of gold produced (at $20) $37,458.25; value of silver produced (at 65c) $19,106.95; Pelatin-Clerici process—100 net tons worked in official test, one bar produced and valued at $1,498.41; ore sales, $4,000.00; miscellaneous revenue, $315.85; total, $62,379.46; deduct all expenses for the month, $44,890.99. Estimated profit for the month, $17,488.47.

THERE have been incorporated at Spokane, Wash., during this year 363 mining companies, with an aggregate capital stock of $300,925,000. In 1893 there were incorporated 18 companies, with a capital of $18,100,000; in 1894, 11, with a capital of $13,508,000, and in 1895, 19, with a capital of $15,702,500. Time was when a capital of $500,000 was most common. Now the favorite amount is $1,000,000; but many have been incorporated for larger amounts, one for as much as $20,000,000. Customs grow up out of necessity, generally, but what is the need for large capitalization for small mines is not apparent. It is becoming a custom to incorporate all properties, large or small, for more than they are claimed to be worth.

THE State Commissioner of metalliferous mines of Colorado reports that there are 25,545 men engaged in mining in Colorado, divided into the following classes: Underground, 15,924; topmen, engineers, ore sorters, trammers, carpenters, 3466; millmen, smelters and sampling works, 5061; teamsters and packers, 1094. By counties they are distributed as follows: Arapahoe 1152, Archuleta 45, Boulder 1353, Conejos 27, Chaffee 482, Clear Creek 1312, Custer 189, Costilla 18, Dolores 356, Douglas 135, Eagle 162, El Paso 3575, Fremont 477, Gilpin 2160, Gunnison 704, Hinsdale 432, Huerfano 23, Jefferson 35, Lake 3984, Larimer 86, La Plata 410, Mineral 336, Montezuma 45, Ouray 1167, Pueblo 1660, Park 381, Pitkin 1500, Routt 128, Rio Grande 75, San Miguel 1105, San Juan 1351, Summit 412, Saguache 268, total 25,545. During the last two years there have been 316 accidents; 154 were fatal and 162 were not fatal. Falling rocks were responsible for the majority of the casualties.

FROM different localities come reports of solicitations of "write ups," etc., of mines for this paper. After thirty-seven years of honorable existence it should not be necessary to say that no one, anywhere, at any time is authorized to solicit such business for this paper. Nor is any one anywhere authorized to receive subscriptions for this paper unless he has a written appointment, stamped and dated at this office. The MINING AND SCIENTIFIC PRESS publishes authentic news from its own correspondents or from the columns of reputable local newspapers regarding mines in every part of the country, but has yet to take its first dollar for putting anything in or keeping anything out of its reading columns regarding a mining property. If anyone offers to secure a paid notice of any mine in this paper, he can be safely put down as attempting to obtain money under false pretenses. None of our agents or correspondents attempt such work. And if any agent or correspondent of any paper is found using the name of this paper in the securing of such questionable business he is liable to prosecution.

SOME time ago W. E. Miles, a stockholder in the Bodie Con. M. Co., brought an action against R. B. Woodward, a director in the company, to recover $1000, liquidated damages, for a violation of the provisions of the act of April 23, 1880. The violation complained of was the alleged failure, refusal and neglect of the directors to make public the weekly reports of the superintendent, as required by the act. The lower court decided against Miles. He appealed. The Supreme Court has reversed the judgment and order, and remanded the cause for a new trial. In the opinion the constitutionality of the act is discussed. The question concerning constitutionality was raised on the point that the act operates only upon domestic corporations, and thereby allows foreign corporations to transact business within this State upon more favorable conditions than are presented by law to similar corporations organized under the laws of this State, in violation of Article XIII, Section 15, of the Constitution. The Supreme Court holds that the law is solely designed to protect stockholders of domestic corporations; and, further, that the act does not apply only to those mining corporations which extract gold or silver from ores and quartz.

THE prospectus has been issued in London of the Mountain Copper Co., Limited, formed to purchase from the Mountain Mines, Limited, of Shasta county, its properties, located near Redding. The capital is £1,200,000, or nearly $6,000,000. The purchase price is £416,630 in fully paid shares and £733,370 in cash, or fully paid shares at the option of the company, leaving a balance of £100,000 for working capital. The prospectus describes the property as "The well-known and remarkably rich copper mines belonging to the Mountain Mines, Limited, of Iron Mountain, Shasta county, California, the smelting works connected therewith, as well as the entire interest in the railway to the mines, and also the refining works in the neighborhood of New York." The report of J. D. Hague is quoted to the effect that the quantity of ore laid open is 1,338,183 tons. Mr. Fielding of the Mountain Mines says that "the cost of production is £2 19s 9d per ton of ore, or £34 3s 4d per ton of copper, and that this cost can be reduced 15s per ton when the company has its own Bessemer and electrolytic plant. The directors estimate that the net profit will be £320,000 per annum, or over 25 per cent on the company's capital, while the total profit on the richer portion of the mines, thus developed, would exceed double the entire capital of the company."

THE House Committee on Mines and Mining has reported favorably the bill introduced by Representative Allen of Utah at the last session of Congress amending the revised statutes of the United States concerning affidavits required to be made before the register and receiver of land offices in the matter of determining the mineral or non-mineral character of lands. The amendment provides that such affidavits may be verified before any officer authorized to administer oaths and all testimony and proofs may be taken under such officer. In cases of contest as to the mineral or agricultural character of lands testimony and proofs may be taken under such notice and regulations as the Commissioner of the General Land Office may prescribe, provided that the presence of rock in placer or deposits bearing gold, silver, cinnabar or other valuable minerals shall be regarded as prima facie evidence that the land containing the same is mineral in character; providing further, that in investigating the character of the land with a view to ascertaining whether it is more valuable for mineral than agricultural purposes, evidence may be taken of mineral discovered or developed adjacent to such land, proof of which shall be corroborative evidence that the land in question is mineral in character; and provided further that wherever land is proven to be within a well defined mineral belt it shall be deemed prima facie evidence of the mineral character of said land.

The Solution and Precipitation of the Cyanide of Gold.*

NUMBER II.

By S. B. CHRISTY, Professor of Mining and Metallurgy, University of California, Berkeley, Cal.

2. *The Effect of Oxidizing Agents.*—This point being clearly proved, the question next arose: Would not other oxidizing agents, capable of liberating nascent cyanogen in a cyanide solution in the presence of gold, also cause its solution? Several hundred experiments showed that this assumption was likewise correct. Nearly all the oxidizing agents were found to be effective. Among those used were: Potassium chlorate, nitrate, permanganate, bichromate and ferricyanide, and the peroxides of barium, manganese, lead and sodium. Each of these, and other oxidizing agents, when added to a potassium cyanide solution, increased the solubility of the gold over that shown in a similar solution without such addition. Among the most convenient and efficient of these agents were peroxide of sodium, peroxide of manganese and ferricyanide of potassium. These experiments were made in 1892–3. It now became apparent that there were many analogies between the cyanide process and the chlorination process. In the chlorination process the gold requires only free chlorine and water for its solution, as the chloride of gold is soluble in water, but in the cyanide process there are required, first, free cyanogen to form the cyanide of gold, and then free cyanide of potassium to form the soluble double cyanide.

As these facts became clear, other means of producing nascent cyanogen in the presence of metallic gold and a solution of potassium cyanide suggested themselves. Cyanogen bromide was the first of these agents that proved effective, in experiments made January 19, 1894. When cyanogen bromide is added to a solution of potassium cyanide the following reaction ensues:

$$BrCy+KCy=KBr+2Cy.$$

In the presence of metallic gold and an excess of potassium cyanide, the further reaction ensues:

$$2KCy+2Au+2Cy=2KAuCy_2.$$

Or, as the two reactions are in reality simultaneous, this may be expressed, as has already been done by Mr. Sulman,† as follows:

$$3KCy+2Au+BrCy=2KAuCy_2+KBr.$$

The success of the above experiment was so great that ten days later, January 29, 1894, a similar process was tried. This was, to add a small amount of dilute bromine water to a dilute stock solution of potassium cyanide, the latter in chemical excess, in the presence of metallic gold.

The reactions that takes place may be analyzed as follows:

$$(a)\ 2KCy+Br=KBr+Cy+KCy.$$
$$(b)\ Au+Cy+KCy=KAuCy_2.$$

Or, as the reactions under favorable circumstances may be simultaneous:

$$(c)\ 2KCy+Au+Br=KAuCy_2+KBr.‡$$

Of the two reagents, bromo-cyanogen and dilute bromine water, I distinctly prefer to add the latter to the potassium cyanide solution, in spite of the opinion of Mr. Teed§ to the contrary. The use of the dilute bromine water is much the simpler method, as the reagent is easily made of any desired strength and may be added as needed, care being taken always to have the potassium cyanide in excess, and not to add the bromine water faster than the cyanogen set free can be absorbed by the gold. To do this correctly requires experience and skill; and unless the work is in the hands of a competent metallurgist, a great loss of cyanide and poor results will follow, whether bromo-cyanogen or bromine water alone is added to the stock solution of potassium cyanide. The reason of this appears to be the great tendency of free cyanogen to form paracyanogen, to oxidize into certain obscure compounds of a dark color, and to "run down" generally. Hence, if the cyanogen is set free faster than the gold can absorb it (owing to lack of contact at the time that the cyanogen is set free), a loss of cyanogen takes place to no useful purpose. Strong solutions of bromine and cyanide of potassium should be avoided for like reasons.

The ideal requirement seems to be to secure that intimate molecular contact which is assumed in equation (*c*), above. In this case the cyanogen reacts in the nascent state. This is a condition hard to realize in the treatment of ores.

In the treatment of gold strips in cyanide solutions, I found that with a given cyanide solution and a given bromine water solution, the amount of gold dissolved by the combined treatment with cyanide and bromine water was, in one case, four times as great as the sum of the amounts of gold dissolved by the same amounts of cyanide and bromine water solutions, each acting separately, all the other conditions being the same.

Chlorine water may be used instead of bromine water. According to the reaction in equation (*c*), 1 ounce of bromine as such will cause the solution of 24.5 ounces of gold, while 1 ounce of chlorine will cause the solution of 5.52 ounces of gold, and, as per Ellsner's reaction, 1 ounce of oxygen will dissolve 2.45 ounces of gold. Weight for weight, the oxygen is more effective than either chlorine or bromine. I have also found that, properly applied, the oxygen of the air gives as good and even better results than either chlorine or bromine. But the latter, being more soluble in water, are more conveniently used.‖

It may be concluded from these experiments that cyanide of potassium solutions, acting alone, are absolutely without action on metallic gold; that the addition of some substance capable of taking the potassium away from a part of the cyanogen, thus setting the latter free in the nascent state, is an essential condition to the solution of metallic gold in potassium cyanide; and that this agent may be either the oxygen dissolved from the air, or supplied artificially, or a suitable oxidizing agent, such as some of those already mentioned, or an equivalent addition of chlorine, bromine, or iodine, or the compounds of these with cyanogen.

Which of these should be used will depend on many conditions, hard to specify briefly. There is danger in using too strong an oxidizer or too much of it. In such a case, not only are other secondary reactions likely to ensue with ores containing metallic sulphides, arsenides and antimonides, which lead to the destruction of the cyanide, but, as already pointed out, the free cyanogen itself, if set free faster than it can be taken up by the gold, simply runs down into oxidized products without doing any good. This is the great difficulty in the treatment of low-grade ores. Nothing but experience and intelligent and trained supervision can meet this difficulty.

One cannot avoid noting a certain analogy between the action of oxygen of the air on the blood and on the cyanide solution. In the former the oxygen is held by the red corpuscles in a state of readiness for combination, but it is not actually used for combustion except under the nervous stimulus which determines combustion at the point where energy is to be produced. In the cyanide solution, the oxygen and the cyanide of potassium may exist side by side in solution (as experiment shows) without sensible action on each other, unless the presence of gold determines the Ellsner reaction at the point where oxygen, water, gold and cyanide of potassium meet. If a thorough utilization of the cyanide is desired, the action of the oxidizer should be such that the cyanide will be decomposed only under the stimulus of the presence of the gold. Under these circumstances, the cyanogen will be utilized to the utmost. If, however, the oxidizer is a powerful one, capable of attacking the cyanide on its own account in the absence of gold, the inevitable consequence will be a rapid destruction of the cyanide, just as would be the destructive effect of such oxidizers on the blood.

It cannot be too much emphasized that it seems to be nascent cyanogen only that acts on the blood. I have tried saturating a cyanide of potassium solution with free cyanogen, but have usually obtained only very unsatisfactory results. The tendency to form paracyanogen probably explains why the cyanogen in this case has no little effect on the gold. The further tendency of the paracyanogen to absorb oxygen and run down explains also why its presence in quantity is not only of no use but is a positive detriment, as it prevents the oxygen from setting free nascent cyanogen which can attack the gold.

On the whole, with low-grade ores and dilute solutions, the cyanide solution itself will, if properly aerated, carry oxygen enough to dissolve the gold; so that artificial oxidizers are seldom needed, unless there is some reducing agent present in the water or the ore, which absorbs the oxygen. In such a case, and with richer ores and stronger solutions, there is sometimes a distinct advantage in the use of oxidizing agents. But, unless used with the nicest discrimination, they do more harm than good.

3. *The Solubility of Gold Sulphide in Potassium Cyanide.*

There still remains a great difference of opinion as to the condition in which gold occurs in its ores. There is no doubt that the greater part of it occurs in the metallic state. Many contend that it is always metallic. It cannot be denied, however, that it occurs combined with tellurium, and there is some evidence that it occurs combined with other sulphides, antimonides, arsenides, and, perhaps, with bismuth, to form compounds little understood, but of great practical importance in the treatment of sulphide ores containing gold.

It seems to be impossible to combine gold with sulphur alone in the dry way. I have, therefore, tried the sulphide of gold, Au_2S_2, thrown down from the acid chloride by sulphydric acid gas. In a 5 per cent solution of potassium cyanide this sulphide dissolved completely in four minutes; in a 1 per cent solution, in ten minutes; in a 1-5 per cent solution, in one hour. In all cases there were found in solution sulphide of potassium (K_2S) and sulphocyanate of potassium (KCyS), and, in most cases, suspended sulphur. The latter was most apparent with the dilute solutions of cyanide.

The reactions which occur seem to be expressed most simply by the following formulas:

$$Au_2S_2+4KCy=2AuKCy_2+K_2S+S. \quad ¶$$
$$KCy+S=KCyS.$$

A third reaction seems indicated by some of the quantitative results, viz.:

$$Au_2S_2+K_2S=Au_2K_2S_2+S.$$

The exact relation of these three reactions seems to depend on the strength of the cyanide solution used. The remarkable solubility of the sulphide of gold is no doubt partly due to the greatly increased surface of the sulphide exposed to the attack of the solvent; but it is also due, no doubt, to the double affinities set up between the gold and the cyanogen on the one hand, and the potassium and the sulphur on the other. There is evidently no call here for oxygen or an oxidizing agent to increase the solubility of the gold.

4. *The Solubility of Gold Telluride in Potassium Cyanide.*

It being very difficult to prepare the telluride of gold in a wet way, similar to that in which the sulphide of gold was produced, I have experimented with telluride of gold prepared by fusing pure gold with tellurim, as well as with natural minerals containing tellurium and gold and silver.**

The result of the experiments so far made has been to show that the tellurides of gold and silver experimented on both dissolve in the cyanide solution with the greatest difficulty. This is probably due to the fact that the affinity of potassium for tellurium is much smaller than for sulphur; but tellurium, tending to absorb oxygen thus forming tellurous acid, also tends to retard the oxidation of the potassium and the solution of the gold.

5. *The Solubility of Antimonide of Gold in Potassium Cyanide.*

An antimonide of gold produced by fusion of the pure metals acted very much as did the telluride of gold. A copious white powder of antimony oxide formed in the solution and the action was retarded, probably for the same reasons as operated with the telluride of gold.

(To be Continued.)

THERE has been more activity in the development of and search for copper mines on the part of capitalists seeking investments in mining ventures than in any other class of properties except, perhaps gold. The largely increasing demand for copper for use in electrical appliances and transmission plants gives promise that the price of copper will continue to advance for a number of years unless very much larger increase is made in the output than at present seems likely. In spite of the larger amount placed on the market during the past year prices have increased. Yet in spite of this there has been very little interest taken by miners in California in the deposits that are known to exist.

---

*Colorado meeting American Institute of Mining Engineers, Sept., 1896. (Revised Proofs Dec. '96.)

†Messrs. Sulman and Teed claim (in the *Eng and Mining Journal*, February 23, March 30 and April 30, 1895), to have made the first discovery of this reagent, and they received an English patent Sept. 14, 1895. Whether their work antedates mine or not, I do not know. A. W. Warwick, in a valuable paper in the *Eng. and Min. Journal*, June 29, 1895, claims to have made the same discovery independently, but does not give the date, and seems to misunderstand the real nature of the reaction that takes place, assuming that oxygen must be present when cyanogen bromide acts in a solution of potassium cyanide in the presence of gold. The MINING AND SCIENTIFIC PRESS of March 2, 1895, says that some months previous to that date a letter had been received from an assayer in northeastern Washington, claiming that bromide could be substituted in the cyanide process. E. A. Schneider, *Eng. and Min. Journal*, March 23, 1895, makes a similar claim. It would, therefore, appear doubtful whether Messrs. Sulman and Teed are the original discoverers of the bromo-cyanogen process.

‡In the *Eng. and Min. Journal*, June 1, 1895, in an article on "A Bromo-Cyanide Process for Gold Extraction," Mr. C. A. Mulholland offers the following provisional explanation of the reaction which takes place when bromine is added to cyanide solutions in the presence of gold:

$$4Au+8KCy+2Br+O_7+H_2O=4AuKCy_2+2KBrO_3+2KOH.$$

This very involved reaction appears to have been imagined because it was supposed that gold could not dissolve unless oxygen was present, the author having lost sight of the fact that the bromine is capable of doing the same work as oxygen.

§*Eng. and Min. Journal*, April 20, 1895.

‖A possible application to the chlorination process suggests itself. Owing to insufficient roasting or imperfect gassing, the tails from the chlorination vats often run high. At present these must either be thrown away or else dried, reroasted and regassed and leached. It might be feasible to have a set of large tailing vats into which such lots may be thrown wet and leached with a dilute solution of cyanide until they were sufficiently low in gold to throw away. The small amount of chlorine remaining in such tails would act to set free cyanogen enough to fix the gold. Care should, of course, be taken to wash out soluble metallic salts and to neutralize the free acid before adding the cyanide. Such a method is likely to fail in the hands of Mr. Stetefeldt's old enemy, "the muscular amalgamator." And it is doubtful whether sintered clots, formed in roasting, and coarse gold which has escaped the amalgamator, would yield to this treatment.

¶It seems hardly necessary to add that in dilute solutions the K_2S is dissociated by the water present, according to the following reaction:

$$K_2S+H_2O=KHS+KHO.$$

**I have had great difficulty in obtaining material of this kind of sufficient quantity and purity for the work, and would be greatly obliged to members of the Institute who will supply me with adequate material. What I particularly desire is the pure tellurides of gold and silver existing separately in such quantity that it will pay for the outlay of time and labor necessary for analyses and experiments.

This is a reprint of the original issue of this date. The big fire in this city on Christmas Day destroyed nearly our entire edition, which was just ready for the mail. The matter was reset, and, with the exception of a little unavoidable delay, the 26th issue of Vol. LXIII of this paper reaches its readers as usual.

Some Points on Prospecting.

A Shotgun Talk With Prospectors. — The average prospector is altogether too superficial in his work; finding a vein of certain mineral-bearing formation, he is content to pick—prospect it in one or two of the larger outcrops. If at these points the blossom rock is barren, or spoon, pan or other simple test gives no satisfactory return, however promising and "lively" the country formation, inclosing rocks, or vein stuff may be, it is considered "no good," and the field is abandoned.

It would appear that our itinerant friend does not realize that the occurrence of pay ore—when in bonanza in a lode claim—is about as one cubic foot in five hundred.

Now, pay is found as pockets or chambers, shoots or chimneys, in strata, mass or patches. Hence, would it not appear to be simply a case of Chinaman luck for a man to strike pay in the ordinary haphazard, quien sabe method, as above outlined? And that is the rule. The apex of a shoot or chamber, when outcropping, may often be covered by less than a saddle blanket; wedge-shaped, with the point upward, and "blind" on either side. A week, at the longest, of desultory pick work, with no good returns, in an extensive virgin territory convinces the easy-going burro puncher that the El Dorado is just "over the divide," and "manana" he will "strike it." There will be more finds recorded when the prospector, having discovered a fruitful territory—if it is in human possibility—camps right there for the season, and, if necessary, when the lode is blind, trench to find the source of "float," and cross-cut every 10 or 20 feet along the line of the lode claim. Stay with it; persistency will win.

If you expect the cow will back up to be milked, you will surely drink black coffee to the end of the chapter.

Points for Prospectors.—Desert prospecting has peculiar conditions, favorable and otherwise. There is no dense vegetation, brushwood or other concealing mantle veiling the face of nature. The rocks crop keenly to the eye in the mountain ranges—a very open book—so that he who has geological knowledge may read as he rides. The disintegrating, weathering, of the more friable, softer rocks alone rendering "blind" certain lode veins. These are often the richest, and may be passed by for years. Witness, in Yuma county, Arizona, the Harqua Hala gold mine, for fifteen years a stamp mill had been pounding on low grade gold quartz six miles away; rich float, found by accident, resulted in the discovery of this noted mine, which is paying well to-day, and the La Fortuna, near Yuma, drywashed by Mexican gambusinos, run over and on line of travel for thirty years, diligent search and trenching by skilled American prospectors for the source of rich gold float, uncovered less than two years ago the mine that is now shipping from twenty head of stamps $80,000 per month. These are but practical illustrations of what may be found all along the Pacific coast.

The lack of water is the principal disadvantage we labor under through the desert. This winter season of '96 there has been copious rainfalls, insuring a good supply of water in the mountain tanks, or natural reservoirs. To first locate these tanks and then mineral prospect is the proper method. When well-beaten sheep or deer trails converge toward a common center in a canyon-rent mountain range, preferedly showing evidence of dike formation, is where tanks are likely to be found. No man should perish from thirst in this desert region, if he can find the following varieties of cacti: If in the mountains, the Nigger Head cactus will generally be found, with its egg-shaped, curly, crimson-spiked jacket, inclosing a water peth, not unlike an insipid turnip, that will allay both thirst and hunger. On the mesas you may chance upon the lofty column of the Monumental cactus; having no way of cutting through the tough skin that covers its water-logged true inwardness, take a rough stone, hack and abrade the gnarled roots, that often extend above the ground, and you may suck the moisture from this bruised member.

Some Useful Wrinkles.—The hard times have sent many novices into the field. To them particularly is this letter addressed. The old timer, however, has much to unlearn—and several things to learn. We will not consider that variety of grubstake prospector (?) whom one of your correspondents has so aptly styled the "desert hobo." He is very much in evidence now, and runs more to fat than industry.

The prevalent fault of the old timer is apt to be that he is too positive, too bigoted, and is generally married to certain (to him) favorite formations, and will have no good in others.

To illustrate: The Montana miner insists on "gramite" as a necessity in the country formation; the Californian, in "contact," or in close proximity "slate" is a prime factor in a gold belt, etc. They do not appear to consider that nearly all kinds of rock are combinations of two or more minerals, and there are many kinds of their favorite formation, a few "fruitful," many "hungry." Nor do they realize generally, how the deposition of mineral is effected by proximity of other rocks. Everyday experience and discoveries verify the trite but true saying that "silver is in veins, and gold is where you find it."

Having by the following simple tests for the more precious metals found your rock contains the minerals sought for, send samples of ore for assay to ascertain the quantity and value per ton. This is of vital importance and too little assaying is done.

Gold.—Powder; roast if sulphurets are present; grind very fine and wash in pan or spoon; examine with lens; yellow particles not soluble in nitric acid. The color of pure gold is bright yellow, tinged with red. Gold may be distinguished from all other metals or alloys by the following simple traits: It is yellow, malleable, not acted on by nitric acid.

Silver.—Pure silver is the brightest of metals, of a beautiful white color, and rich luster.

Chloride of Silver.—If suspected in a pulp, harshly rub a bright and wet copper cartridge thereon. If a chloride or chloride-bromide of silver, it will whiten the copper. Graphite will thus whiten copper or gold, but can be rubbed off.

Copper.—After roasting pulp, intimately mix and well knead with a like quantity of salt and candle grease, or any other fat, and cast into the fire, when the characteristic colors—first blue, then green—will appear. This copper test is better made at night.

Galena.—Black zinc-blende is often mistaken for galena. The two may be distinguished by this infallible sign: the powder of galena is black; that of blende, brown or yellow. TAYLOR D. MACLEOD.

Yuma, Arizona, Dec. 20, '96.

A "Mother Lode" in the Cascade Mountains.

Several times I have seen mentioned and described in the columns of the MINING AND SCIENTIFIC PRESS the so-called mother lode of the Sierras. Nevertheless, so far, I have not been able to form for myself a concise idea about the geological and mineralogical occurrence of that lode. Is it a single vein, a dyke, or a body of heavy mineralized country rock, or an irregular accumulation of veins or pockets in the contact of two formations, broken up, dislocated, disturbed and metamorphosed by plutonic or volcanic rocks? According to the descriptions given, I am not able to answer any of these questions. If this "mother lode" is expected to be found in the northern continuation of the Sierra, which are the Cascade mountains in the States of Oregon and Washington, probably I might be able to throw some light on this question.

About fifty miles east from here, in the highest range of the Cascades, north of Mount St. Helens, we discovered several years ago an extensive mining region, which had shown in its geological characteristic a striking similarity to the well-known mining regions of the Sierra and the Rocky mountains in Colorado. Stratified quartz, black and blue slate, talcose slate, quartzite rocks are broken up, metamorphosed and intersected by eruptive rocks of almost every kind. This region is about three miles wide, its extension from north to south is yet unknown. It is literally full of fissures, crossveins and heavy mineralized dykes of every width and directions. Some of these dykes show a diameter of more than one hundred feet. Seams and pockets of ore are seen to occur almost everywhere. They all contain different kinds of copper ores and pyrites of every description, having in some localities considerable gold and silver.

Almost all these ores—only a few exceptions are known, so far—are very refractory; placer gold has been found only sparingly and exceptionally. The whole region is easily accessible, but heavily timbered (fir, red and yellow or Alaskan cedar, spruce, pine, mountain larch and hemlock predominating).

As part of the ranges reach far above the timber-line (between 7,000 and 8,000 feet above sea), and as there is heavy snow every winter, there is an abundance of everlasting water power in the whole territory.

If this region belongs to the formation where the so-called "mother lode" is expected to occur, it may be considered as the missing link in the chain of conclusions. K. LUDLOFF.

Toledo, Wash., Dec. 14th, '96.

A Proposed Two-Mile Shaft.

A correspondent of the London *Mining Journal* suggests that the British Government should take up the question of aiding the Cornish mines and proposes that a shaft be sunk in the Caradon Hills two miles deep. He says:

"The deepest shaft in the world is, I think, the Maria shaft, Prizibram, Bohemia, said to be 608 fathoms 2 feet. The maximum speed ever attained in winding is said to be 3000 feet per minute. With guided cages it is, I think, estimated that to draw two tons of stuff at this speed will require engines of 400 H. P. Now, sinking a shaft a mile would represent 880 fathoms, and 282 fathoms deeper than the great shaft in Bohemia. If you take £200 a fathom to sink 880 fathoms, it will be £176,000, and if 50 per cent is added to that for the second 880 fathoms, we get for that £264,000, or for a shaft two miles deep £440,000. Now, allowing for all eventualities, one million sterling would put down a shaft in the Caradon Hills two miles deep. This is a small contribution for a paternal Government."

A shaft in the Calumet & Hecla mines in Michigan is down 4,900 feet.

Some of Nevada County's Mines.

Grass Valley, Cal., has the reputation of having small ledges and much tribute work, and I learn from several superintendents that they prefer a 14-inch vein in this section to the large ore bodies of low grade in other parts.

The tribute workers, as a rule, are prosperous. It costs from $8 to $10 to keep the mine open and to mine and mill the ore, which averages in most cases from $30 to $40. There are large ledges, nevertheless. There is also much undeveloped country here awaiting outside capital.

Deep mining is in every case the successful method pursued. It is well known that Grass Valley miners think nothing of going a half mile down into the earth, of which a notable example is the old Idaho, which to-day has engine, pumping works, a stable and two mules 1000 feet underground, and the total depth attained is 3100 feet.

The principal plants in operation, together with number of stamps and locality of ownership, are as follows: The Maryland, operating through the old Idaho, 40 stamps, owned by local and San Francisco people; the Empire, 40 stamps, New York and San Francisco people; North Star, 40 stamps, New York people; W. Y. O. D., 20 stamps, San Francisco and local people; Omaha Consolidated, 28 stamps, San Francisco people; Brunswick, 20 stamps, New York and local perple; Pennsylvania, 5 stamps, local people; Gold Hill, 10 stamps, San Francisco people; Southern, 10 stamps, custom mill; Orleans, 5 stamps, local and San Francisco people; Electric, 10 stamps, Sacramento people; Perrin—or Slate—mine, 10 stamps, local people; Granite Hill, 5 stamps, Sacramento people.

Among the once abandoned properties now being reopened, together with some new developments, with locality of owners and depth attained to date, are the following: The Kate Hayes, San Francisco people, 200 feet; Kentuck, San Francisco people, 400 feet; Wisconsin & Illinois, local people, 600 feet; Norambagua, local people, 400 feet; Massachusetts, property of North Star, 400 feet; Bullion, San Francisco people, 600 feet; Crown Point, French people, 500 feet; Independence, San Francisco people, 800 feet; Franklin, San Francisco people; Central Q. M., San Francisco people; Gold Point Consolidated, 200 feet.

Water costs 18 cents per inch for twenty-four hours. Wood averages $4 per cord.

The Gold Hill is using electricity for milling and hoisting.

The Massachusetts is using electricity and compressed air for the hoist.

Two additional mines are preparing to use electric power.

Some years ago the Allison Ranch mine, having reached a depth of 700 feet and made its owners wealthy, was abandoned. Recently Messrs. Mackey and Flood secured the property. The Allison ranch and the Allison ranch station comprise about sixty-five acres, under one ownership. After the preliminary work of securing water and ditch rights, and pipe line, the work of erecting the present plant was bugun in June. They have substantial buildings for power house, hoist and residence.

The superintendent of construction expects to start pumping the old shaft about the middle of next month.

The plant is arranged for water power to drive the compressors, pumps and hoist. This is so arranged that, if interfered with or shut off, steam can be used; or, in the event of failure of either of these, electric power can be turned on. The latter—240 H. H.—is derived from the Nevada County Electric Power Company. The plant can be run by these three powers jointly, in which case it is capable of producing over 640 H. P. Any one of the motive powers can be used alone, or two, or all three jointly. This method of utilizing the three different powers is supposed to be the first case of the kind in existence.

The compressed air system comprises the double stage compressors of 250 H. P. capacity. The underground pumps and machinery are built on the compound system, and all the air before entering the pumps or engines is reheated, so as to obtain the greatest useful effect from the combined system. The construction of this work, a model of its kind, is done under the supervision of Mr. W. R. Ackert, who for eighteen years has been the consulting engineer of Mackey & Flood and of the Union Iron Works. J. F. L.

Grass Valley, Cal., Dec. 16th, '96.

Nevada City District Geology.

NUMBER III.

Economic Geology.

Gold.—Although gold is widely distributed over the Sierra Nevada, in veins and placer mines, there are but few regions in it which show such a concentration of valuable deposits within a narrowly circumscribed area as occurs in the districts described in this folio. The mines in the Grass Valley district have been and are especially productive. Next in production follows the Nevada City district, and the Banner Hill district comes third. Statistics for the first decades succeeding the discovery of the gold in 1849 are very defective, but it is estimated that the mines in the three districts together have produced $120,000,000 up to the present time. Most of the production of early days came from the placer mines, which were often of extraordinary richness. Of late years the gold from Grass Valley is derived almost exclusively from the quartz mines, while in the other districts the placer mines still contribute a small part of the product. Since 1889 the product of Nevada county has been constantly about $2,000,000 per year. Of this, from $1,100,000 to $1,500,000 comes from the areas of these special sheets (including the Brunswick area and the maller mines on Deadman's Flat, four miles southwest of Grass Valley). Grass Valley and vicinity leads, with a production of $750,000 to $1,000.000, while Nevada City (Nevada City and Banner Hill maps) follows, with from $300,000 to $600,000. The larger amount of the production from Grass Valley has come from a few prominent mines, such as the Eureka, Idaho, Empire, North Star, Omaha and W. Y. O. D. In the vicinity of Nevada City the mines west of the town, usually referred to as the "Creek mine," have yielded the largest quota.

Auriferous Gravels.—The disintegration of the gold-bearing quartz veins has, as is well known, yielded the material for the gravels. The gold set free is in part distributed through the mass, but as a rue the larger quantity has been deposited on the surface of the older rocks on which the gravel rest, or, as the miners say, on the bedrock. The Neocene auriferous gravels, some of which are exposed, others being buried under several hundred feet of unproductive clay, sand and volcanic material, lie in the channels of the Neocene streams from 200 to 500 feet above the bed of Deer Creek. Wherever exposed without heavy covering material they have been washed by the hydraulic process, by which the whole mass of the gravel is removed. The richest gravels in the bottom of the old stream are removed by drifting along the bedrock and subsequently washing the mined gravel. By the former process, gravel containing only 5 or 10 cents per cubic yard may be made to pay, while the latter process requires a value of at least $2 or $3 per cubic yard. Hydraulic mines have not been operated in the district for at least ten years on account of the debris litigation. The only ground adapted for extensive mining with the hydraulic process is found near Nevada City. The alluvial gravels are the auriferous accumulations in the depressions of the present surface. Every creek and ravine in these districts has been worked over one or several times by sluicing, and very little gold is now obtained from this source.

Within the area of the Nevada City and Banner Hill maps a small hydraulic cut has been made in the fine gravel to the east of the Cold Spring tunnel. A large opening has been made to mine the channel south of Deer Creek, a short distance southwest of the Lecompton mine. As the gravel is very thin and a bank of 100 feet of andesitic tuff is already exposed, not much more can be accomplished by hydraulic methods. Drifts have been run for a short distance, but no work is being done now. The same statement applies to the hydraulic cut south of the Murchie mine, where a minor channel runs north and south. For some distance from this point along the rim, hydraulic work could be prosecuted. To the east the bedrock rises rapidly. Thence southward to the reservoir smaller hydraulic cuts have been made at intervals along the lava contact, either on smaller channels, or, more frequently, on the decomposed croppings of quartz veins extending under the lava. Especially extensive are the old pits in the vicinity of the Mayflower mine, where some ground is yet left for hydraulic operations. Some tunnels have been run in under the lava at various places.

The drifting operations under the Harmony Ridge are extensive. The Harmony channel, with its branches, has been opened and worked profitably by the Cold Spring incline and tunnel, and lately by the East and West Harmony inclines. A northern branch has been mined from Stokes shaft and other places in the vicinity of Monroe's vineyard. South of this, attempts to reach the same channel have been made at the Yosemite incline and at the edge of the Banner Hill district. Allison's tunnel and incline are now being driven in search of the continuation of the Harmony channel. In the adjoining district it has been mined almost continuously from Coleman shaft and Nevin's and Laney's tunnels to its outlet. The pay gravel in the Harmony channel is from 150 to 200 feet wide and only from 2 to 4 feet deep. It is frequently subangular, and contains many quartz boulders. Gold-bearing quartz veins are sometimes exposed in the bed. As it is firmly cemented, it is necessary to crush the gravel in stamp mills in order to extract all of the gold.

The Manzanita channel has been worked extensively by hydraulic methods from its southern end, and also to some extent at the northern end, at Howe cut. Between these points it has also been drifted nearly continuously by the Manzanita, Nebraska, Live Oak, Odin, and other companies. Near the Nebraska incline the channel was narrow and especially rich, while to the north the gravel spreads out considerably and is more spotted in character. The channel is estimated to have produced over $3,000,000. The most extensive hydraulic mines are southwest of the Sugarloaf, where an area of at least 100 acres of bedrock has been exposed. The different portions of this ground, going westward, are referred to as Buckeye hill, Oregon hill, Coyote hill, Lost hill, Wet hill and American hill. Over this ground the gravel probably averaged over 60 feet in thickness. The last work done before the debris litigation was in the extreme northwestern corner, and is referred to as the Hirschmann cut, from which, it is said, $100,000 have been taken. The whole mass hydraulicked contained, roughly speaking, 10,000,000 cubic yards, and has probably yielded several million dollars. The hydraulic operations could be continued for some distance northward, until the overlaying clays and tuffs become too heavy for profitable handling.

(To be Continued.)

The Rand Mining District.

From Our Special Correspondent.

The Rand mining district is located in Kern county, California, and is 26 miles north of Kramer, on the A. & P. R. R., and 40 miles northeast of Mojave, on the S. P. R. R. Daily stages run from Kramer and Mojave to the camp.

Mining men from all parts of the country are looking over the camp. Speculators are buying; conservative mining men are looking on.

There has been but little development work done, most of that having been on the surface in taking out rich bunches. The camp deserves thorough development work, and needs practical mining men; but until many of the present owners let go, there will be but little permanent work done. Many of the present owners are not able to develop their properties, and many others lack knowledge and are not willing to give practical miners a chance.

The country for miles around Randsburg has been located, some parties holding as high as twenty and thirty claims each, and some even more. Many of these claims have not been recorded, and no work done on them; still the prospector insists that he can hold the claims. Much confusion prevails at present, and much trouble is expected January 1st. Prospects are held at high prices, and as the terms are 30 days or spot cash, few claims are changing hands.

The ore of the camp is, with few exceptions, free milling, which, with custom mills near the mines, makes it possible for the prospector to work his ore. Many of the prospectors are shipping ore extracted from or near the surface.

In some cases the ore extends down but a few feet, others are down 130 feet in good ore. The general strike of the ledges is east and west. Dip north 40° to 80°. The ledges range in width from a few inches to 30 feet. The free milling ore of the camp is shipped to Kane Springs and Garlock, a distance of 19 miles, the former place having one stamp mill, the latter place two mills, with two more in course of erection. The cost of shipping and milling ore is $10 per ton from any part of the camp, which makes it profitable to ship all or nearly all of the ore in the camp, as no ore is worked that pays less than $25 per ton.

The mills are not able to handle the ore offered. More mills are needed to handle the ore of the camp. The mines are all dry and require very little timbering, old railroad ties being the timbers used at present. Water is very scarce; in fact there is no wood nor water near the mines, and unless water is developed in the vicinity the cost of reduction will remain high.

This camp is a poor place for miners and laborers who are looking for employment. There is no work at present, the camp is full of idle men, and until things settle down to a solid basis and permanent development work is commenced there will be no need for miners. There is plenty of room for practical prospectors who have a few hundred dollars. There is an unlimited amount of mineral ground which is worth thorough prospecting, but a man without money can do nothing and should keep away from Randsburg.

The population of Randsburg at this date is about 1500 and more are coming on every stage. At this date the mines working employ about 100 men at $3 per day. More men will be employed as soon as permanent development work is begun, which will not be until most of the property changes hands. The present owners are working the mines for all there is in them, taking out the best ore and leaving the low grade. The future of Randsburg looks very promising, and if the ledges go down it is sure to be a booming camp for years. The mines have all paid from the grass roots. Every dollar that has been put into the mines has been taken out of them. Rand, Butte, Wedge and Good Hope have all produced thousands of dollars; besides that many smaller mines are paying handsome dividends. Poor men have come here without money, located claims and commenced shipping ore from the surface. Some of the surface bunches have been dug out, others are being worked to a depth of 60 and 80 feet with good ore going down. If the ledges "go down" the camp is a bonanza, and will be a great gold producer, but until more development work has been done mining men will be slow to invest.

ANDREW F. ROSENBERGER.

Randsburg, Cal., Dec. 16th, '96.

Placer Gold Mining in Eastern Oregon.

Having just returned from a trip up Snake river, perhaps some of the items of information gathered in regard to the fine gold placers of that section may be of interest to your readers.

We stopped off at Ontario, a small but thriving town on the Oregon side in Malheur county. Situated as it is in a valley about ten miles wide, much of the surface as level as floor, it seems a most unlikely place in which to find gold, nevertheless it is there, distributed up and down the valley for hundreds of miles; though as Missouri Jake used to say, "it is more than half gravel." In some places the miner or prospector in search of a "grubstake," may rock out from $1.00 to $3.00 per day. These pay streaks are usually found about the upper ends of the islands and the bends in the river. In some places bars several hundred feet from the river are stripped and the pay gravel hauled to the river and washed The overlay is a sandy loam, generally about 5 or 6 feet deep, and produces good crops of hay, grain and potatoes, with irrigation. When the crops are harvested, many of the farmers along the river commence mining, gathering gold beneath the same ground from which they may have taken a crop of potatoes a few weeks before. The plant most generally used for washing the gravel, consists in part of a horse-power Chinese pump, from which the water is led to a shallow box about 3 feet square, the sheet iron bottom of which is perforated with about one-quarter inch holes. These serve to distribute the water over a finer screen placed at an incline of about 35°.

The holes in this incline screen are about one-sixteenth of an inch in diameter, about sixteen to each square inch. Over this screen the gravel slides, being assisted by the water falling over it from the screen above, which washes the fine sand and gold through it, whence it falls from 2 to 5 inches upon an amalgamator or silver-plated copper table, set on inclination of about 2 inches to a foot. Upon these tables the greater part of the free gold is caught; the tailing being run through a blanket or burlap sluice to save what may have escaped. Some dispense with the Chinese pump by bringing in water from the irrigation ditches, thus cutting down expenses considerably. It is a cheap and simple device and when not overcharged saves the gold quite effectively. Its capacity is from fifteen to twenty cubic yards per ten hours. There have been numerous attempts made to winze gravel from the bottom of the river by means of hydraulic dredges, but, so far, these experiments seem to have resulted in failure, as the mill and dismantled boats and scows tied up along the river will testify. We noticed a rocker being industriously worked almost under the stern of one of these machine boats, which it is reported had cost over $25,000. It secured a sarcastic rebuke to some one's mistake and mismanagement. Those who stick to the banks and bars seem to be meeting with encouraging results and are in a fair way to solve the problem of working the pay gravel upon a large scale. We went up the river about fifteen miles above Ontario, and found considerable work going on with the machine above described. We regretted that limited time would not admit of our going farther, as we were informed a Mr. Singer, a son of the famous sewing machine inventor, was operating upon a bar a few miles above with satisfactory results. It would seem that as long as the gravel will pay to rock or work with the crude appliances now in use, there should be some way of working it upon a large scale profitably. The gravel varies greatly in value; assays from a claim below Ontario running all the way from 14 cents to $8.41 per cubic yard, the last being from a narrow pay streak, but the greater part of the workable gravel will go from 50 cents to $1.00 per cubic yard in free gold, besides what is contained in the black sand. The magnetic sand contains little value, but it is associated with a non-magnetic iron sulphide, which is said to assay well, some claiming as high as $200 and $300 per ton. Be this as it may, they are certainly worth a careful investigation and a saving of the gold they contain may go far toward solving the problem of the profitable working of the fine gold placers of Snake river. WM. W. WASHBURN.

Baker City, Or., Dec. 15, '96.

Costs of Milling and Mining.

To those opening up mines, data as to the cost of milling, mining, sinking of shafts, running of tunnels and other work in any mining district is of great importance, and is always sought for before making estimates as to the value of a property and as to how it should be worked. In Africa, and in fact in nearly every mining field where British operators predominate, there is an abundance of this data obtainable. In this country, however, much less attention has been paid to this question. The State Bureaus and the United States Geological Survey have done considerable good work in this direction; but they have been handicapped by the disinclination on the part of a great many mine owners to impart such information. Reports from large and well-managed mines that go into the details, giving items of cost, are of great value in making calculations.

The cost of milling and mining—milling especially—depends not entirely upon the cost of the actual necessary items, but the manner in which the work is managed. A mill that is run steadily and to its fullest capacity will often show a great difference in the cost from another working under similar conditions, but in which there is not the same care in its management. The closing of the mill or the hanging up of part of the stamps will much more largely increase the cost than is generally supposed. Stopping half the stamps in an ordinary mill means the doubling of the cost per ton generally for superintendency, for taxes, for insurance, for office supplies and other smaller items, and for a large part of the labor, water and wood. These items make up in all from 40 to 60 per cent of the running.

There are many mills in this State in which preparations and proper precautions are not taken to reduce the stoppages to a minimum. A little extra cost in keeping on hand all the necessities for making repairs and constant and careful watching of the machinery would often reduce the present cost per ton considerably. Then, care is not always taken to keep the mill constantly supplied with ore from the mine.

It is the purpose of the MINING AND SCIENTIFIC PRESS to publish from time to time data as to the cost of milling, mining, sinking shafts, running tunnels, etc., obtained from representative mines of different districts.

The following data furnished by John Ross, Jr., superintendent of the Wildman and Hector mines at Sutter Creek, Amador county, with mills of thirty and forty stamps respectively, show what may be accomplished by skillful and careful management in well equipped properties.

DETAILED AVERAGE COST OF MINING ONE TON OF ORE AT THE WILDMAN MINE, SUTTER CREEK, 1895. JOHN ROSS JR., SUPERINTENDENT.

	Cost Per Ton, Cents.	Total Cost for 31,591 Tons.
Timbers	16.0	$ 5,046.20
Spiling	4.8	1,532.98
Lumber	2.2	687.57
Charcoal	1.7	539.35
Candles	2.1	656.25
Powder	4.8	1,533.65

Mining Prospects in Wyoming.

A good deal of interest is manifested in mining in this vicinity. Besides the strike made at the Grand Encampment creek in Carbon county, the mining property of James Douglas in the Sandstone district, about forty miles south of Rawlins, has developed unexpected richness. He has had a 300-foot tunnel driven on one of a group of his claims in that district, and has struck a 3-foot lead which runs nearly parallel with the tunnel, assaying $154\frac{10}{100}$ ounces in gold and $18\frac{20}{100}$ ounces in silver to the ton. Mr. Douglas has ample private means and will prosecute work on the claim vigorously, and by next spring will have on hand the necessary machinery to handle the ore.

In the Grand Encampment district Messrs. Chatterton and Kurtz, who were the original locators in this district, have driven a tunnel 1000 feet into the mountain and are now within 100 feet of the main lead. This tunnel already cuts one lead upon which was first sunk a shaft 50 feet and a drift 40 feet, the vein being 3 feet wide and running 20% copper and from $4 to $8 in gold. It also cuts a blind lead 3 feet wide which runs 14% copper and $12 gold. They have during the past fall sunk a 90-foot shaft upon the main lead, which is 40 inches wide and assays $40 in copper and gold, and are preparing to drive a tunnel to tap this lead at a depth of 300 feet. These gentlemen have thus far spent some $16,000 in developing the property, but it is estimated that there is enough ore on the dump to more than repay them.

Some fine specimens of ore taken from the Clara May, Florence and Ethel May claims have been on exhibition at the office of the Rawlins Mining Exchange. Creed McDaniels and M. W. Dillon, owners respectively of the Druggist and the Exchange, have shipped specimens of ore for assay. The best, however, of the latest specimens from the Grand Encampment has come from the Virginia and Belle Platte claims owned by Messrs. Osborne, Kurtz and Landon. On breaking open a piece of the Virginia ore it was found to contain chalcopyrite and cuprite which runs 30% copper and carrying gold and silver.

The Peggy D. Mining Co. has incorporated at Rossland; capital stock $250,000, to develop the Bessie P. and other claims in the Grand Encampment.

The Upper Platte Valley Gold Mining Co. has also filed articles of incorporation. Capital stock $1,000,000, and headquarters at Saratoga, Wyo. They will operate principally in the Grand Encampment country.

Tunnels are being driven in the Golden Eagle, owned by A. H. Huston, and it is expected to strike the lead at 300 feet.

P. Paulson, who has been developing his copper properties near Rawlins, has opened a vein which indicates that both copper and silver in paying quantities will be found.

The Rambler mine, at Battle Lake, Carbon county, has taken out 125 tons of copper this summer. The facilities for doing this work have been very poor, and all the ore has to be hauled by teams some 25 miles to a railway station, and 70 tons are now at Walcott, on the Union Pacific, awaiting transportation. ROB'T. JOHNSTON.

Rawlins, Wyoming, Dec. 19th, '96.

About Saving Gold in the Mills at the Rand, South Africa.

Having repeatedly seen statements in your valuable paper of the gold recovered from batteries, plates, concentrators and the cyanide process at the South African mines, it seems strange that those accounts have not been more thoroughly discussed and looked into by mining men of California. As the ore or conglomerates of the Rand seem to be hard and free of sulphuretes, and the gold therein bright and of an amalgable character, they save a small per cent in the batteries or mortars and on the plates, and have recourse to the cyanide process so extensively, to recover a large per cent of gold lost in the mortars and on the plates. Their labor is cheap, as they employ Kaffirs, but it appears evident they are taking out their best ore now, and that it is only a question of a few years when those mines will be closed down.

As an experienced miner and millman, it seems to me that if they would pay more attention to their amalgamation and do away with much expense, it would be better. As all practical miners, as well as theoretical ones, must admit the quicker you save the gold after it leaves the rock or matter crushed the better, and the further it gets away from the batteries and mill the more difficult and expensive. If in free amalgamating ore you can save all the gold in the mortars and plates, it would be the cheapest and surest. I saw, some time ago, where, at a certain place, they took some $8000 from plates in hard amalgam by "buckling or bending" the same, which shows that their style of amalgamating must be imperfect, as plates should never be allowed to get so hard under the eye of a competent amalgamator. The mill being the place that is looked to for expenses and profits, this matter is important. Of course, so long as they have plenty of good rock, this will not be severely looked into. But the day of reckoning must come, as their veins are narrow, from one to four feet wide.

There are two things to be considered in this matter. One is that the crushing capacity of the stamps has been exceeded by forcing four and one-half tons to the stamp through a battery in twenty-four hours, as they do in South Africa, this being a very large amount; or that the amalgamators do not bestow proper care. All gold that is free in the vein matter crushed can readily be amalgamated, be it "brown or rusty," even, as in the mine that I have been connected with for years the bulk of the gold is "brown or rusty," and we have no difficulty in saving 90 per cent in the mortars and on the plates. Of course, all appliances for saving gold are necessary adjuncts and safeguards to a mill.

I have been induced to write this little article from the fact that gold mining must come to the front again in California as one of the principal industries, and anything that will increase the yield of gold and decrease the expense in our low grade ores should be carefully looked into, as San Francisco and California have tried to live on agricultural, horticultural and viticultural products and found them insufficient to make business thrive.

Some of the old mining counties now almost deserted afford sufficient room to employ a very large population to good advantage. G.

San Francisco, Dec. 19th, '96.

THE Alameda, Cal., County Miners' Association has a new departure worthy of emulation by other county associations. It has decided to hold meetings about once a month when the members will be addressed on some topic of interest to miners. Among the subjects proposed are: "The Cyanide Process," Professor S. B. Christy; "Auriferous Gravels of California," Charles B. Yale; "The Mother Lode," H. W. Fairbanks; "Quartz Mining," E. H. Benjamin; "Electric Power in Mining," F. W. C. Hasson. Following these lectures there will be discussions of the several topics.

Scientific Progress.

Imitation in Nature.

It is a well known fact that most, if not all, animals partake of the color of their surroundings, those inhabiting mountainous or flat regions having coats of solid color similar to the rocks or plains, while those living in the forest usually wear striped or mottled suits. The camel and lion are sand colored, the polar bear white, like the eternal snows among which he lives, and the wolf, the mole and the nocturnal rat, all of which prowl about by night, wear neutral colored habits. The lizards, snakes and grasshoppers, which live in the sand, are gray or brown, while their brethren of the trees and grass are green.

The spots of the leopard may be mistaken for flecks of light between the foliage of his forest home, and the stripes of the tiger for the reeds of his native jungle. An interesting mode of deceit used by the tiger is his hunting call, which so resembles the loud whistle of a deer that only an expert can distinguish between them, and the deer themselves respond to it.

An African traveler has described the coat of the zebra as a "thunder and lightning pattern," and asserts that, instead of rendering the wearer conspicuous, it makes him quite the reverse, "the white stripes appearing like bars of light between the trees."

Some animals change their suits to match the season, while the colors of others vary to harmonize with the objects upon which they rest. Of the former class are the Arctic fox, the variable hare and the ermine, all of which lay aside their coats of gray and don one of pure white when the snows of winter come. Familiar illustrations of the latter class are the chameleon and tree toad.

Among the birds are many examples of protective coloring. The woodcock folds his conspicuous tail under his Quaker garb and becomes invisible, so well do the colors of his plumage harmonize with the fallen leaves.

The sand grouse of the desert are so like the sand that even when running it is almost impossible to see them.

The ptarmigan of Scotland, on its bed of heather and lichens, is indistinguishable; and when winter approaches this bird changes his plumage to pure white, and so resembles his snow-covered heaths. The partridge in a plowed field is most inconspicuous, the spots on his feathers appearing like the lumps of earth and shadowy interstices.

Machinery vs. Brains.

The skilled workman of to-day is as much a product of the times as the machines he is so largely occupied in tending, and though the operative of to-day may be individually as intelligent, and undoubtedly far better educated, and an all-round better citizen than his predecessor of a previous generation, yet, so far as his actual work is concerned, brain power is being practically superseded by steam power.

I make this rather sweeping statement deliberately and with a sincere conviction that, disguise it how we may, while our machines are becoming almost human, nay, almost superhuman in their powers, the workman himself is, as a matter of fact, more and more nearly approximating to the condition of an automaton—a wage-earning machine. He is living upon the brains of dead-and-gone inventors, pioneers of mechanical industry, like Maudsley and Bramah and Whitworth. The mechanic of the present day gets through his day's work without the necessity of exerting himself to more than the most trifling extent, either bodily or mentally. I quite admit that this is a gain, on the whole, for all the parties concerned; for the workman, because, though his work is lightened, he earns better wages and is at liberty to devote his intelligence to doing good for himself in other ways—his status is raised; he has time and opportunity for rest and rational recreation; his day's work is not, as formerly, his day's sole occupation. It is a gain, too, for his employer. A single man's production is now from five to fifty times what it was in the early days of mechanical engineering. It is good for the community at large—directly, because the increased facility of production lessens the price at which good articles may be purchased, and, indirectly, because the man, relieved from exhausting toil, is a more valuable citizen than he who has no leisure to devote to the improvement of himself and his fellows.

I must not, therefore be understood as conveying a reproach when I assert that the mechanic of the period has his mental as well as his bodily labor performed for him.—Cassier's Magazine.

Rails of Wood Pulp.

The successful introduction of railroad rails made entirely from paper material in Germany and Russia, has encouraged American manufacturers to experiment. The foreign mode of making the rail consists in the employment of molds and powerful pressing machines—the former for shaping the rail and the latter for consolidating purposes. Paper car wheels have been in use for many years and have given satisfaction.

The heavy locomotives and other rolling stock of these days require extraordinarily large and heavy rails; consequently, the rails cannot be made very long, as the weight would be too much. The paper rails are less than one-half lighter for the same length and size; so that, so far as the weight question is concerned, the length of the latter can be twice that of the iron or steel rail. This obviates the use of just so many joints, dispensing with many bolts and connections, and relieving the wheels of the car from just so many shocks.

The process of manufacturing the rails is not difficult when once the necessary compression apparatus is available, as the solidifying operation is probably the main part of the work. The composition of the rails includes several varieties of paper pulp stock. Wood pulp has not been tried with any marked success as yet, but ordinary pulp from rags, rope stock, etc., answers the purpose. The processes of grinding, cooking, digesting and working of the rags into a pulpy condition are accomplished in regular order, care being taken to have the stock uniform in preparation and the fiber as well preserved as possible. When in a pulpy condition, the ingredients for stiffening the rail rendering it tough and efficient, so as to stand excessive wear and friction from the wheels, and for imparting elasticity, smoothness and other needed requirements, are applied. So varied have these been that no definite portions of any of the substances are procurable.

Quantities of borax, litharge, paraffine wax, tanners' grease, waterproof fish glue, rosin and fine cement are employed in necessary proportions, and are added to the pulp while it is yet warm. Mixing follows, and the ingredients are thoroughly combined with the fiber. A quantity of shellac and wood alcohol is next put into the mixture, and the mass is subjected to another stirring and then permitted to settle.

The paper rails are strong, durable, can be bent for curves like other rails, and possess the advantages of lightness and increased length, besides being easier for the wheels and cars, and having other points of superiority. Their cost is said to be 30 per cent less than that of steel. They are adaptable for both paper and iron car wheels.

DR. NANSEN, baffled in his attempt to reach the North Pole, although he got nearer to it than any one else has ever been, reports a fact which upsets some old ideas about the Polar sea. He found that the sea north of Siberia is shallow in its southern portion, averaging only 90 fathoms deep, but that above latitude 79° it suddenly becomes profound, the bottom falling to a depth of from 1600 to 1900 fathoms. If this applies to the entire polar basin, then the North Pole does not lie in shallow water, as many have supposed, but is situated in the midst of a deep sea—a fact which has a bearing upon the problem of how best to reach the pole.

EXPERIMENTS have lately been made by the physiological department of Yale University on the influence of alcoholic drinks upon the chemical processes of digestion. The investigations were made by means of artificial digestive experiments, in which the digestive fluids were allowed to act upon the various food substances under definite and constant conditions. Absolute alcohol in four cases appeared to actually stimulate digestive action by a fraction of 1 per cent, but the amount of alcohol present did not exceed 1 or 2 per cent. Whenever alcohol was added in quantities over 2 per cent, digestive activity was markedly checked; in one instance 3 per cent of alcohol reduced the digestive activity by 17.6 per cent. Pure rye whisky containing 5 to 51 per cent of alcohol yielded practically the same results; even an addition of 1 per cent of this spirit was found, taking the average of the experiments, to reduce digestive activity by over 6 per cent. In three cases, however, an increase in digestivity of from 3 to 5 per cent were recorded when additions of whisky in the proportion of from 1 to 3 per cent were made. Brandy, rum and gin gave practically the same results. Whisky can be considered to impede the solvent action of the gastric juice only when taken immoderately and in intoxicating quantities.

IT is well known that men and women need change of air, but about the reason why they need it there is no agreement of opinion. A new theory upon the subject is advanced by Dr. Louis Robinson. From the assumption, which in itself is plausible enough, that the original progenitors of the Indo-Germanic peoples were nomads or wanderers is drawn the inference that an occasional removal from place to place is craved by a deep-seated hereditary instinct. There is no doubt about the fact that a change of air is beneficial not only when the change is from bad to good, but from bad to bad of another kind. A resident of Rome, for instance, will often find his health improved by removal from the finest quarter of the city to the Ghetto, where malodorous as the district is, the Roman fever seldom penetrates. Dr. Robinson cites the case of an English sufferer from asthma and bronchitis, whose home was in a healthy part of the suburban country, Surry, but who obtained very great relief from a sojourn among the slums of the Seven Dials. Many other examples might be given to show that mere change, irrespective of the qualities of the atmosphere exchanged gives a fillip to the system and increases its recuperative power.

A MEMBER of the United States Geological Survey has just calculated the height of Mt. Rainier, Wash., at 14,519. It has heretofore been placed at 14,444, while that of Mt. Shasta, Cal., is 14,440.

Electrical Progress.

IN a recent lecture Jas. Swinburne gives a quaint account of a scientific wild-goose chase in which he had been engaged when attempting to formulate a commercially successful process for extracting the tin from tin scrap. It has long been held as an article of faith among the disciples of "waste products" that the utilization of scrap tin was a matter which involved possibilities of pecuniary gain. Accordingly Mr. Swinburne set himself to discover a means whereby the extraction of this metal might be profitably accomplished. As the result of his researches he devised an electrolytic process which accomplished the theory. The problem was solved, and all that remained to do was to get large quantities of scrap and then make a fortune. But alas! there was no scrap to be had. In fact there is none. The cost of collection is far too great ever to afford the remotest prospect of this new industry coming into existence.

THERE is a revolt in England against the Government management of the trunk telephone lines because of the obstructions which prevent immediate communication. If a man in London wishes to speak with a man in Liverpool he calls up his own central office and makes known his desire. The operator there transmits the request to the general post office in London. That office, when it gets ready, communicates with the general post office in Liverpool, and thence to the local telephone exchange in the latter city, and finally the desired subscriber is reached. Under the old system such connections did not require more than two minutes. The Government seems to be unable to accomplish it in less than twenty-five minutes, and often a much longer time is occupied.

AT the Central Indiana Hospital for the Insane at Indianapolis the equipment of the laundry with electrically heated sadirons has reduced the number of employes at the ironing tables nearly one-half. The reasons why such results are possible are that the electric irons are constantly supplied with a uniform amount of heat, nearly all of which is absorbed by the work, and by reason of the constant supply every rub is equally efficient. There being no appreciable heat radiated from the iron, it is apparent that in a room where the temperature can be regulated, and there is no vitiation of the atmosphere due to combustion, much more work can be accomplished.

A NEW syndicate, with practically unlimited capital, is reported formed in Chicago to engage in the telegraph and long-distance telephone business, composed of New York, Philadelphia and Chicago men, whose plan is to connect about 1000 independent telephone exchanges by long-distance wires, to penetrate other territory rapidly, and to keep on building until all the States and Territories are wired. "Telegraph and long-distance telephone services at a popular living rate" is the promise of the promoters. The territory of the American Telephone & Telegraph Company, or long-distance Bell Company, will be invaded at every point.

THE Boston Terminal Company, which is constructing the new Union station, contemplate a new departure in railroading. Their plans provide for the joint handling of electric and steam traffic. In some respects the new station may be considered as being an electric road station, for it will provide for the handling of the suburban traffic south of Boston, amounting to hundreds of millions of passengers annually, by means of electric trains.

A BERLIN SCIENTIST has ascertained by experiment that a number of persons who use the telephone habitually hear better with the left ear than with the right. To educate the right ear to the same point he recommends holding the instrument in the right hand half the time. The common practice of the telephone companies is to place the receiver so that it will be applied to the left ear.

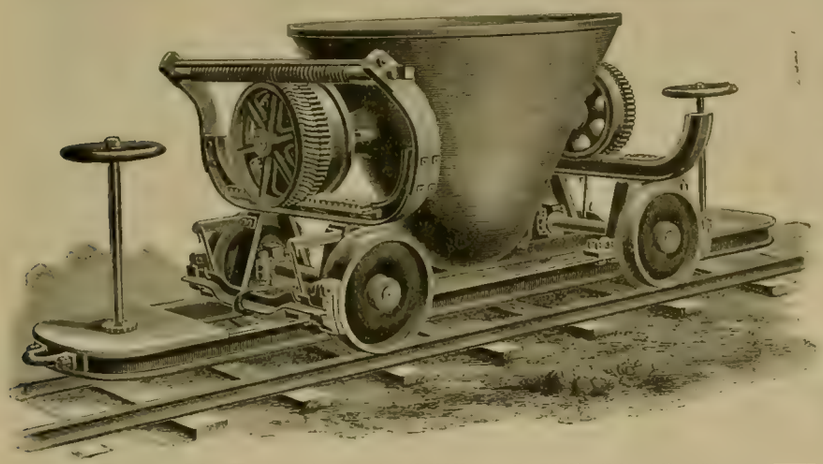
PARIS will soon have a trolly line. Before a late meeting of the General Council of the Seine was a proposal to work the tramway between the Bastille and Charenton by electricity. Some opposition to the use of overhead wires was manifested, but finally the council decided to accept the offer of the tramway company to construct at their own expense.

THE submarine cable between New York City and Hayti was completed on the 1st inst., and opened for business the same night. The injunction suit against this cable line, brought by the Attorney-General of the United States on the ground that it was a foreign enterprise, is still undecided, Judge Lacombe having the matter under consideration.

Mechanical Progress.

Disposing of Slag at Smelting Plants.

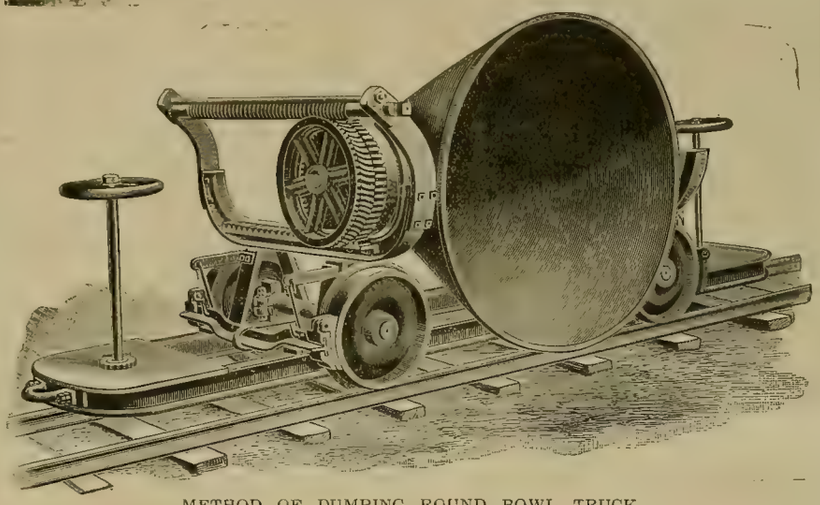
The disposition of molten slag at smelting plants is of importance in furnace practice. The longer the plants are in operation the larger and wider grow the slag dumps of necessity, consequently removing the dumping grounds farther and farther away from and less accessible to the furnaces, rendering the handling of the slag by the ordinary hand slag-pot carts very inconvenient and laborious. The necessity for an improved and quicker method of disposing of slag from furnaces caused the Colorado Iron Works of Denver, Colo., to devise and patent a truck or car to run on a track, carrying two bowls, which proved a success. That company has since devised two other trucks based on the same principle, carrying one bowl each, but of much greater capacity than the double bowl truck, to meet the varying conditions at the different smelters. These are made of iron and steel throughout, thoroughly strong and rigid to withstand the rough usage to which they are subjected and many of them are in use at various smelting plants throughout the country. In some cases they are drawn by locomotives; at others, by mules and horses; or at other smelters they are handled by cable and stationary winding engine.



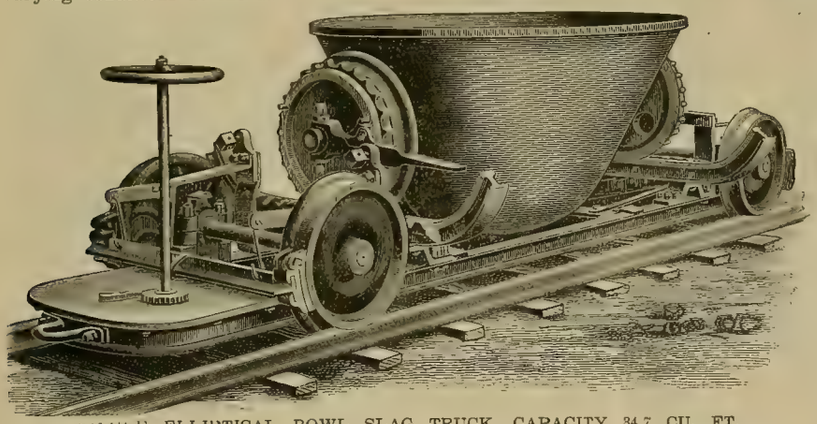
SINGLE ROUND BOWL SLAG TRUCK, CAPACITY 35.16 CU. FT.

The success of the double bowl truck occasioned a demand for a truck of greater capacity and the one shown in the first two illustrations on this page was designed to supply this want. It has a capacity of 35.16 cubic feet and measures 4 feet 7 inches from top of track to top of bowl. As the cuts show the style of the truck perfectly, a detailed description is unnecessary. The bowl is suspended or hung on trunnion axles on which are keyed wheels that roll on a track placed transversely of the truck. A screw gear is also keyed to one of the trunnion axles of the bowl and a screw extending across the frame operated by a hand crank and fixed in boxes at its two ends, engages in the gear, revolves it and the bowl is thus rolled over on its wheels far enough to pour out all its contents over and beyond the track. It is fitted with platform and brake wheel on one end for use on the grades when necessary. The length of this truck over all is 13 feet and 6 inches, width 6 feet, and weighs complete about 6300 pounds.

Some smelters require a truck of large capacity but not exceeding in height the double bowl truck. To meet that demand the Denver company furnishes the truck illustrated in the last two cuts on this page. It consists essentially of a single elliptical-shape bowl suspended by trunnions on a pair of flanged wheels. These wheels traverse a track placed transversely of the truck, seventeen inches each way from the center, and when in dumping position the bowl extends over and outside of track rail 12 inches. The trunnions of the bowl are so placed with reference to the center of gravity, that when empty the bowl will drop back and stand right side up in position, ready for receiving slag. When loaded the center of gravity is immediately above the center of the trunnions and the bowl can be easily dumped or rolled over by being given a slight push out of the center line of gravitation; and when thus relieved of its contents it returns to its upright position by reason of the center of gravity now being below the center of trunnions. The dumping and returning, as well as retaining the bowl in its normal position, are entirely regulated by means of suitable brakes.

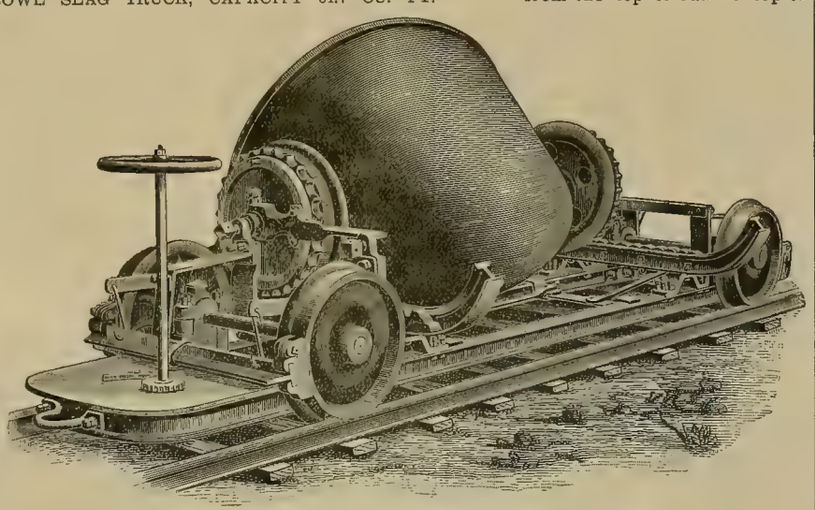


METHOD OF DUMPING ROUND BOWL TRUCK.



SINGLE ELLIPTICAL BOWL SLAG TRUCK, CAPACITY 34.7 CU. FT.

The height is 3 feet 3 inches from the top of rail to top of bowl. It is 15 feet 5 inches long and 5 feet wide over all, and weighs ready for shipment about 6500 pounds.



METHOD OF DUMPING ELLIPTICAL BOWL TRUCK.

Aerostatic Railway.

A balloon is to be the propelling power used in carrying passengers to and from the top of the Hochstauffen mountain, at Bad Reichenhall in the Austrian Alps. This aerostatic railway is the invention of Engineer Volderauer. A local body of engineering experts has said that the scheme proposed is feasible and safe. On this recommendation the local authorities have sanctioned the road's construction to the mountain. The power by which visitors are to climb this mountain is furnished by a captive balloon. This runs along a track built at the side of the roadbed. A trailer, furnished with many wheels, clasps this wooden rail, and to this trailer the passenger car is fastened. The operator has a seat in the car, and a cord swings between his place and the balloon, by which the gas supply is regulated. He has also several brakes and safety devices at hand in case of accident. At the foot of this unique railroad is a gas tank and generator. Gas is made here to illuminate the town, and also for the purpose of filling the balloon. A charge sufficient to carry the car to the top of the mountain is given it at the start, and when the grade has been mounted, and all is ready for the return down the mountain, a small quantity of gas is released, and the car starts down, its rapid descent being checked by the gas that has been allowed to remain in the balloon. Permission to construct the aerostatic railroad was granted only after the most searching investigation had been made of the plans. There are many novel safety devices to prevent any serious accidents.

Firing a Canon Under Water.

A curious experiment was recently made with a piece of ordnance at Portsmouth, England. A stage was erected in the harbor within the tide mark; on this an Armstrong gun of the 110-pound pattern was mounted. The gun was then loaded and carefully aimed at a target—all this, of course, during the time of low tide. A few hours later when the gun and the target were both covered with water to a depth of six feet, the gun was fired by means of electricity. We said "aimed at a target," but the facts are that there were two targets, but only one was erected for this special experiment, the other being the hull of an old vessel, the Griper, which lay directly behind the target and in range of the ball. The target itself was placed only 25 feet from the muzzle of the gun. It was composed of oak beams and planks, and was 21 inches thick.

In order to make the old Griper invulnerable, a sheet of boiler plates 3 inches thick was riveted to the waterlogged hull, in direct range with the course the ball was expected to take if not deflected by the water. On all of these—the oaken target, the boiler plates and the old vessel hull—the effect of the shot from the submerged gun was really startling. The wooden target was pierced through and through, the boiler iron target was broken into pieces and driven into its "backing," the ball passing right on through both sides of the vessel, making a huge hole, through which the water poured in torrents. The experiment, apparently, demonstrated the feasibility of placing submerged guns in harbors in time of war.

In the motor carriage race from Paris to Marseilles and back the distance was 1070 miles. The fastest vehicle made this in 67 hours 42 minutes and 58 seconds. The average was 15.85 miles per hour. All the competing carriages had benzoline motors.

Nearly all the machinery for the manufacture of boots and shoes, throughout the world, is of American invention.

Mining Summary.

CALIFORNIA.

Amador.

Dispatch: The shaft at the Anita is down 530 feet. It is like all the other shafts in the district, having three compartments. A crosscut was run eastward 75 feet from the 500-foot level to the ledge and the managers are now drifting north and south on the ledge, and quartz is being taken out that assays very well.

At the Jackson Gate they are drifting eastward from the shaft on the 300-foot level.

Ledger: M. Bearce has secured the Poker Bill mine, near the Contrares, and intends to open it up by tunnel.

Calaveras.

Chronicle: At the Mitchell mine, near Railroad Flat, the shaft is down 80 feet and will be put down to 500. The main tunnel is in 450 feet, and there is a continuous ledge the entire length. The 10-stamp mill will be ready for operation in a few days.

Citizen: Stockton men have a bond on the Benson quartz mine, near Central Hill, and will begin operations at once.

At the Emerson, near Mokelumne Hill, a double compartment shaft is being sunk between the two parallel ledges, which are about 100 feet apart. The machinery on the mine is capable of sinking to a depth of 1000 feet.

Mountain Echo: The Parnell mine is about to pass into the hands of a company, under a year's bond.

The Bald Hill mine is freed from water, awaiting parties who are to examine the property with a view to purchasing it.

The Coddington mine, on the Dead Horse lode, has been leased to Messrs. Mercer & Huston, and work on a small scale will be commenced on the mine shortly.

At the Lightner mine a three-compartment, 7x14 shaft is being sunk; at the Great Western the shaft is down 80 feet and will be sunk deeper; at the Ghost mine the shaft is down 300 feet and it is the intention of the company to sink to nearly 2000 feet before opening up a general system of stoping; a shaft is being sunk on the Koolah and a new shaft on the Utica. Besides these, there are a number of other shafts being sunk or in contemplation.

Angels *Voice*: The Thorpe Mining Company will sink 200 feet further this winter and in the spring will probably put up a mill.

On the Melones property the work of enlarging the old shaft to three compartments is approaching completion.

The new shaft of the Utica is down about 70 feet. Three Burleigh drills are being used.

The mill at the Gwin is running on rock from the dump and shaft, as stoping has not begun.

Fresno.

The *Republican* reports the sale of the Copper King mine to an English syndicate by Hugh Knepper. The mine is thirty miles north of Fresno. The ore occurs in three forms—black oxide, sulphite and carbonate. The first named predominates and is the richest. A recent assay of the oxide, taken from where the ledge is 28 feet wide, showed 37 per cent of copper, $9 per ton in gold and some silver. The oxide will average from $75 to $80 a ton in all, and some of it goes as high as $12 in gold.

A tunnel, 450 feet long, has been cut through from one ravine to another, following the apex of the ore body, which lies in large swells, showing a width of from a few feet to as high as 28 feet. Two shafts have been sunk, one to the depth of 82 feet, and the other 40 feet. In the former a crosscut was made at 60 feet, where the miners found nearly 13 feet of ore. It is estimated that the new company will develop the mine on a large scale, and a smelter will probably be put in to reduce the ore.

Kern.

RANDSBURG DISTRICT.

(Special Correspondence).—The Rand mines, the Rand Mining Company owners, C. A. Burcham superintendent. — This group consists of twelve claims which are located on Olympus and Trilby hills, three-fourths of a mile south of Randsburg. The development work on the Rand group is as follows: The Rand claim has a shaft 70 feet deep, vein 9 feet wide; ore all mills $50 per ton.

The Yellow Aster claim has a tunnel in 300 feet; average width of vein, 1 foot; ore mills $150 per ton.

The Olympus lode is 30 feet wide from wall to wall and averages $15 per ton. The development work consists of a tunnel on the lode, with shaft 130 feet deep on hanging wall; shaft all in pay ore averaging $35 per ton. At the 50-foot level a drift has been run 300 feet on the hanging-wall side in ore averaging $20 per ton.

The Trilby is a small stringer 10 inches in width on which a tunnel has been run 40 feet; value of ore, $400 per ton.

The Rand group of claims was discovered in April, 1895, by C. A. Burcham, the present superintendent. The mines have paid from the surface, and every dollar expended on the property has been taken out of the mines. The ore from these mines is shipped to Garlock, the 8-stamp mill at that place being kept busy, and is not able to handle all the ore from the property. Forty men are employed at $3 per day. Cost of shipping and milling is $10 per ton.

Butte mine, A. T. McKenzie manager—This mine is located a quarter of a mile northeast of the postoffice. The ledge runs east and west and is exposed on the surface for at least 1000 feet. The ore chute extends the entire length of the claim. Considerable ore has been shipped from the surface and paid well. The development work consists of a tunnel and three shafts. The tunnel is on the east end of the claim, 100 feet deep. A winze in the tunnel is 40 feet deep. The east shaft has been sunk 100 feet. At 55 feet a level was run 115 feet west, connecting with a shaft 50 feet deep. The east level is in 90 feet, with crosscuts 10 feet. The west shaft is down 125 feet. Crosscut has been run 23 feet north to the ledge. Crosscut in ledge 7 feet and no hanging wall; all in ore that mills $50 per ton. Ore from this mine is shipped to Kane Springs, a distance of nineteen miles. Cost of shipping and milling, $10 per ton. Fifteen men are employed at $3 per day.

St. Elmo Mines, St. Elmo Mining Company, owners; D. M. Pyle, manager. — The St. Elmo group are located five and one-half miles southeast of Randsburg, and consist of five claims. The St. Elmo ore is base, and has to be shipped to smelters for treatment. One carload of ore was shipped to Denver, Col., which paid $100 per ton. There is about 300 tons on the dumps which the manager said was a good grade of ore, but would not pay to ship to the smelters. Development work consists of two shafts, each 40 feet deep. Width of ledge 2 feet, all pay ore.

The Wedge Mine, J. W. Rogers, superintendent. — This is a small claim, wedge shaped, between the Butte and the Good Hope mines. Development work consists of an incline shaft 100 feet deep; ore mills $25 per ton; ore shipped to Kane Springs mill; fifteen men employed in mine.

The Good Hope Mine, Kinyon and Sons, owners; G. B. Kinyon, superintendent.—This claim is on the Butte ledge, and lies west of the Wedge mine. The development work consists of an incline shaft 110 feet deep. At 70 feet a level has been run east 75 feet, with a winze 20 feet deep at its east end. Width of ledge 10 feet, all of which mills $100 per ton; six men are employed in the mine at $3 per day; ore is shipped to Kane Springs.

The Bully Boy mines, Bully Boy Mining Company, owners; B. M. Atkinson, superintendent.—This group is located two miles south of Randsburg and consists of seven claims. The ore has paid from the surface and most of the work has been done on the surface along the ledge. One shaft has been sunk 40 feet on the ledge. Width of ledge in shaft from 6 inches to 2 feet, all ore, milling $80 per ton, some having been shipped that paid $110 per ton.

The Yucca Tree and Winnie mines, Charles Koehn, owner.—These claims are three miles south of Randsburg and were recently bought by Mr. Koehn for $5000. On the Winnie claim there has been a shaft sunk 60 feet. Width of ledge from 18 to 26 inches. Ore taken out of shaft milled $60 per ton. The Yucca Tree claim joins the Winnie on the north, has a shaft 90 feet deep, ledge 10 to 16 inches wide. Ore taken out of shaft milled $100 per ton. Two other shafts have been sunk, each 30 feet deep, showing ledge 6 to 8 inches wide. Ore milled $150 per ton.

The Marced mine, Stephenson Brothers, owners.—This mine is located three miles south of Randsburg. At this date the mines are leased to McBride & Co., who are extracting very rich ore, which will be shipped to the Kane Springs mill. The veins are very small but very rich.

Santa Ana mines, Munson & Layton, owners.—This group of mines is located 2½ miles south of Randsburg and consists of three claims which were recently purchased by Munson & Taylor of Los Angeles for $10,000. The present owners are making preparations to prospect thoroughly. The ledges are very small but rich. A shaft will be sunk on one of the ledges.

Black Hawk Mines—This group of claims are located two miles south of Randsburg. At this date they are taking out pay ore which will soon be shipped to one of the custom mills.

Berlin Mine—A. T. Stewart, of Los Angeles, has purchased an interest in the Berlin mine and will commence development work at once.

At the St. Elmo mine the Line Mining and Milling Company, of Los Angeles, have erected a dry washer with daily capacity of 300 tons. The plant is run by a 10-H. P. gasoline engine. The company have leased 160 acres of placer ground and expect to make a profit on dirt that will pay 50 cents to the ton.

Riggs Well—This well is located about four miles northeast of Randsburg and about two miles northeast of Johannesburg, and has recently been purchased by Charles L. Morrill, G. H. Curtis and H. A Darling of Los Angeles. Curtis and Morrill are in charge of the work at the well; thirty men are employed laying a pipe line from the well to Johannesburg and Randsburg. At present the well supplies one inch of water, with water increasing very fast as they go down. It is confidently expected by the owners that ten inches of water will be developed in the near future. As soon as more water is developed a stamp mill will be built to work custom ore. The pipe line now being laid has a capacity of ten inches and will furnish water for Johannesburg and Randsburg. Johannesburg is a new town being laid out by Curtis and Morrill, and is between Randsburg and Riggs' Well. R.

Randsburg, Dec. 16, '96.

Randsburg *Miner*: The Walkover group, owned by H. B. Watson of Randsburg and A. S. Munson of Los Angeles, and located one and one-half miles from Goler, has been bonded to Ward & Co. of San Francisco for $20,000, thirty days time. The character of rock is a copper carbonate of low grade, the reduction of which will necessitate the erection of either a smelter or cyanide mill.

Mariposa.

Gazette: The Triumph Mining Company of Whitlocks that is operating the Helm group of mines under the supervision of Mr. Mackintosh, are sinking a new shaft. They have leased the Ellingham mill and are having it repaired.

The Geary mine on Whitlocks, the property of the estate of Schanz Foran, is bonded to Mr. Doolittle of San Francisco, who has been operating it. He has sunk a shaft and about a week ago got down to the vein which shows up well.

C. C. Wallace has had a force of men working on the Rolin's mine for about a year and a half. They have been driving a tunnel in to tap the vein lower down. The tunnel is in about 600 feet and will shortly be in to the vein.

Nevada.

Tidings: At the Cadmus mine the new 10-stamp mill will be ready to run in a few days.

The annual meeting of the stockholders of the Pennsylvania mine was held last week. The following were elected directors: E. H. Brown, T. Wilhelm, F. J. Thomas, J. M. Thomas, J. P. Stone, F. Zeitler. They elected E. H. Brown president, Theo. Wilhelm vice-president, F. J. Thomas secretary, Citizens' Bank treasurer, John Eddy superintendent. A stock dividend of the surplus stock was declared.

Henry Richards is taking out rich quartz from a tunnel in the Sharp & Nivens ground, near Canada Hill.

Union: A recent crushing of five tons of ore from the Belle Fountaine mine in Willow Valley district yielded $80 per ton. When the present tunnel is run 100 feet further it will tap this shoot and give 600 feet of backs.

Placer.

Colfax *Sentinel*: At the Azalea, in Blue Canyon, the contractors will have the tunnel finished before the end of the year.

The Van Avery, owned by M. T. Barnett & Company, is showing up well. The company have a 3-stamp mill on their ledge, which is over 12 feet wide, and prospects well.

The Redstone mine, owned by ex-Governor Wiley & Company, is closed down for the winter. Operations will be resumed in the spring.

Stanley & Company are running a bed-rock tunnel to tap a quartz vein in the vicinity of the Redstone mine.

Woodbury & Schell intend resuming operations on their mine in the spring.

At the Pioneer mine rapid progress is being made at the No. 4 lower tunnel. Two power drills are used, and the tunnel was advanced 317 feet during the month of November. The tunnel is now in over 1800 feet. The new machinery will be ready to run in a few days.

Superintendent E. A. Frenzel has a force of men at work at the Dorer quartz mine. The 10-stamp mill is being repaired, and will be run day and night. The ore in sight is very good.

The Dorer Brothers, the report says, have struck some very rich ore in the Central quartz mine, near the Dorer.

H. M. Freeman has sold a one-third interest in the Gold, Silver and Nickel mine, in Rattlesnake canyon, about four miles north of Cisco on the old Meadow Lake road. T. J. Smart, of Seattle, was the purchaser. The mine will be thoroughly prospected next spring.

At the Rising Sun mine a pipe line is being surveyed to convey water for power to run compressors to be used in driving the 1800-foot tunnel in from Bear river. The tunnel will tap the shaft at about 500 feet from the surface. It has been driven over 200 feet by hand work.

Plumas.

Independent: The Golden Ancient Channel Mining Company has been incorporated by Santa Clara men. The property of the company is on Bear creek, in this county.

Six men are employed in Charles Hegard's mine, on Rock creek.

The owners of the Union Grand mine, at Gibsonville, and A. Schofield, who owns a tract of mining property on the east of and adjoining the Union, have let a contract for running a tunnel from a point in the Union near where Tim Judge took out last winter a chunk of gold weighing between seven and eight pounds. The present contract is for 200 feet, but it is the design to run it across the Union ground about 700 feet, where it will be taken up by Lowell, Clough and the Schofields, and run across the ground formerly known as the Nip-and-Tuck 400 feet, and thence, if prospects are favorable, will be run on in the Michigan ground by Lowell and Clough.

San Bernardino.

(Special Correspondence).—In Kramer mining district, C. A. Peer of Colorado Springs, Col., has bonded a number of claims south of Kramer. Mr. Peer and his associates will build reduction works at Kramer in the near future. The ledges are large. Ore assays from $10 to $60 per ton. The ore is rebellious and cannot be worked by the free milling process.

Kramer, Cal., Dec. 19th, '96.

San Diego.

The Escondido *Advocate* declares that the old Escondido mines have cleared up more gold bullion at less expense during the past four months than any other mine in the State. The result of the last clean-up was twenty pounds of pure gold, besides amalgam sent away for retort.

A deed was filed in the San Diego county recorder's office last week, conveying from C. W. Ireland of Bridgeton, N. J., to the Golden Dream Mining Company of the same place, a number of groups of mines in the White Gold Basin of the old Picacho district, for $70,000. The groups transferred are: The Golden Dream group, consisting of five claims; the Alcyon group, of five claims; the Oro Blanco group, of five claims; the Noonday group, of eight claims; the Little Frank group, of four claims.

Shasta.

Free Press: The new 10-stamp quartz mill which Captain J. H. Roberts of Sacramento built at Harrison Gulch was started up last week. The pay chute has now been uncovered for a distance of 795 feet. The ledges show good width, the smallest being 22 inches.

J. W. Frank of Harrison Gulch has sold the White Oak mine near Lower Springs to T. O. Carter, of San Francisco, for $5000. Mr. Carter will soon begin the erection of a steam hoisting plant.

At the Mountain Mines (Limited) works at Keswick, the first smelting furnace was of a patent fuel-saving design. After numerous experiments the furnace was reconstructed and is now in perfect working order. The slag from the furnace is run off into a stream of cold water, which crystallizes the molten rock and forms a fine black sand, which is carried down the stream. The matte is run into slag pots and then wheeled to the moulds, where it is formed into plates. After cooling, these plates are broken up with hammers and the matte placed in sacks, which are loaded upon the cars and shipped to the company's refinery in New Jersey. The capacity of the furnace now in operation is 380 tons per day. The capacity of the one in course of construction is the same. The company's ore is estimated to yield 14 per cent copper, with a small percentage of both gold and silver. The matte assays from 60 to 70 per cent pure copper, and the output of the smelter now averages thirty tons per day. In the experimental stages of the smelting plant it was found that the sulphur with which the ore is heavily impregnated formed into huge clinkers, which choked the furnace. By roasting the ore the sulphur is eradicated. When completed the roasting plant will consist of 500 roasters. The ore is formed into large kilns with pine wood scattered about through them. The wood is ignited and the sulphur consumes itself in from forty to sixty days. The company has already expended over $1,500,000, and will increase the capacity of its smelting plant by the erection of new furnaces until the number reaches five. There are now over 300 men employed at the smelting and roasting plants and 100 at the mine. At the mine the ore is loaded directly into the cars, ten of which constitute a train, and are drawn by one locomotive. The cars have a capacity of ten tons each. Two engines are now in use and a third has been ordered.

Sierra.

Union: The New Sierra Buttes mine at Sierra City, which is being operated by W. H. Martin and others, is reported to be looking well. There is an immense body of ore in sight, and the mill is kept running night and day. A few days ago the miners struck another big ledge in the hanging wall, which shows well in mineral. The company will probably add several more stamps to the mill in the spring, as there is enough ore in sight to keep a 50-stamp mill running steadily.

Mountain Messenger: I. Copeland, near the Northern Belle mine at Loganville, is erecting a 5-stamp mill for prospecting.

At the Prospect mine, in Slug Canyon, the front ledge was cut some time ago, and the men have since been driving the tunnel ahead to reach the back ledge.

Outside work at the York mine is nearly completed for the winter. Development work in the mine is being pushed ahead.

Siskiyou.

News: F. D. Fraser is about to interest New York capital in his Golden Eagle, Siskiyou and Black Crow mines on Indian creek. The first thing done will probably be the erection of a stamp mill and the tunnels extended to tap the Black Crow vein at a depth of 300 feet below the surface. This ore mills about $60 per ton.

Harbaugh & Walker have located an 18-inch ledge on the Quartz valley side of the mountain.

Journal: The Klamath River Dredger Company is working at Oak Bar, having found a good paying bed of gravel. They will keep at work all winter. There are many rich places on the Klamath that the dredger can work which have never been mined at all. Since this dredger started up last summer they have worked on paying ground most of the time.

Reporter: Moxley & Fitzsimmons are sinking a shaft on the Cosmopolitan mine in Quartz valley, and the ledge is widening in depth.

At Sawyers Bar the Oregonian property, which has been lying idle for over a year, is again in operation under the management of Pierpont, Eldridge & Malloy.

Trinity.

Journal: On East Fork the North Star mill is running steadily with a small force in the mine. The ledge is from 3 to 7 feet thick.

Nicholson and Kleckner, who have a lease on the Poor Man mine, had twenty-eight tons of their ore milled in the Enterprise mill last week, which turned out over nineteen ounces of gold or nearly twelve dollars a ton.

At Deadwood a new mine is being opened up at the foot of Donnelly Gulch.

The Sibyl mine is making extensive improvements.

W. S. Lowden proposes that a company be formed to sink a shaft to prospect for the channel of the old bed of the river which formerly ran through Weaverville. It is a well-known fact that the bedrock of the basin wherever reached is what is known as false bedrock. By sinking a shaft to the proper depth there is no question but that it would tap the ancient channels and open up a vast amount of auriferous gravel for dirt working. The question could be thoroughly tested at a cost of from $2500 to $5000. These ancient channels are worked in other counties of the State successfully.

Tuolumne.

The Fitzgerald brothers of Sonora have sold the Golden Era mine for $80,000 cash. This mine adjoins the Jumper mine, and both will henceforth be worked by the same company.

The managers have decided to put in a hoisting engine right away at the Whisky Hill mine, so that the shaft may be sunk with more speed.

Independent: The Sunset mine on the South Fork of the Stanislaus river, owned by Frank Vassallo and Abe Sartori, has a 2½ foot ledge which shows free gold. The rock is estimated at from $30 to $50 per ton. The mine has been bonded for $20,000 and with Joe Rolleri as

superintendent, a tunnel will be run in on the vein from the river, giving several hundred feet backs.

Capt. Edwards and Wm. Butis are opening up a prospect west of Nigger Hill.

Considerable prospecting is being done at the Peking Consolidated mine, near Parrot's Ferry. Several other mines in that neighborhood have been started up.

Near Robinson's Ferry on the South Carolina a tunnel has been run to a depth of 1200 feet, and crosscutting is being done.

Operations will be resumed on the Lady Washington shortly. Superintendent Fisher has been devoting his attention to opening up the Modoc, near the Buchanan, with very flattering results.

It is stated that the Norwegian mine on Jackass Hill on the east lode has been sold for $25,000 cash. J. Lawson and two sons were the owners of the property. The purchaser is R. B. Murdoch, of the Bank of Commerce, who buys for European capitalsts.

NEVADA.

Silver State: Strong & Graves have begun work upon the Blackbird tunnel, driving it until the ledge is tapped, when the mill will be started.

De La Mar *Lode*: Good reports continue to come from the Magnolia mine and preparations are being made to ship ore to the market.

Elko *Tidings*: A new hoisting works has been erected by the Dexter Company and a new mill completed.

Pioche *Record*: Interest yet centers in the old El Dorado Mining district in the extreme southern part of this county. At the Marie Camp, five miles below El Dorado canyon, the San Francisco company will soon be ready to start up its new mill. W. C. Wallace, who was in the district last year, was recently in London to place some properties. Several conveyances from him to English parties were filed in the County Recorder's office here last week for record.

Lyon County *Times*: The Succor mine, in Silver City, formerly owned by S. Longabaugh of Empire, has been sold to James, Taylor & Deitrich for $10,000.

Reno *Gazette*: Work will shortly be commenced on the Big Indian mine, in Esmeralda county.

Austin *Reveille*: The Ione Gold Mining Company's team has arrived in Austin with over three tons of concentrates which will be shipped to a smelter for reduction as soon as a carload lot can be made up.

White Pine *News*: A 4-foot ledge of gold ore is reported uncovered in the Ely mine.

A good showing is reported on the Los Angeles, some rich washes in gold having been taken from there recently.

Another rich strike in copper has been made at West Camp in the Star of the West. The ledge is over 8 feet wide and can be traced for a considerable distance.

The Ben Hur Mining Company of Granite district are negotiating for a 10-stamp battery to erect on the stream of water at Campbell's ranch, convenient to their mines, and expect soon to be in active operation.

OREGON.

Baker City *Democrat*: Mill building at the Columbia and Ohio mines in Cracker Creek district is being pushed as rapidly as the weather will permit. The Columbia plant is expected to be in operation this week.

The Ten Strike mine at Bourne has been sold to the Longmaids by Thomas McEwen.

The Con. Virginia shaft is now down 250 feet and deep sinking will continue until a depth of 500 or 600 feet has been reached.

The 600-foot working shaft at the Virtue is being sunk 100 feet deeper.

Grant's Pass *Observer*: About 19,000 pounds of machinery for black sand mining arrived at Coquille City lately. It is owned by foreign capital, who have had representatives there for some time past.

Jacksonville *Times*: Several giants are being operated at the Alexander & Bent mine on Galice creek, formerly owned by Ennis & Cameron.

S. Mulveyhill and Chas. Anderson of Gold Hill district recently found a valuable deposit of mineral on Water gulch. The formation is a stratum of porphyry and iron.

Southern Oregon's gold output this year promises to exceed that of any previous one for a long time, judging from the preparations for the opening of new mining propositions and the increased activity at mines which have been operated before.

Medford *Miner*: The Black Gold Channel mine has started up again with a force of thirty men, under the management of Mr. Pierce of Oakland.

Rogue River *Courier*: Baylord & Iliff have been delayed in getting their 5-foot pump from the East. They have put in a 30-inch flume to carry off the debris into Rogue river, and when the pump is at its highest capacity it will turn 1500 inches of water against the gold-bearing banks at what will equal a 250-foot pressure.

Younglove and Green have begun piping on Louse creek. They have a 900-foot tunnel flumed and will pipe night and day.

BAKER COUNTY.

The Ibex mine, Sumpter district, has been bonded to William White, representing the Hearst estate. The bond price is reported to be $65,000.

BRITISH COLUMBIA.

Mining Journal: Ice in the Fraser and Quesnelle rivers has stopped all dredging operations for this season. The dredgers in the vicinity of Quesnelle have had considerable trouble with their machinery. What little work was done goes to show that if they can be made to work successfully a fortune is made for the shareholders.

The Golden Cache mine near Lillooet has a ledge traceable for 2500 to 3000 feet, showing a width of from 12 to 24 feet, and underlying a slate formation and carrying gold. The property was purchased last spring for $25,000 by Vancouver people. Shares are now selling at a rate of $1,000,000 for the whole property.

Rossland *Miner*: The contract for the construction of twenty miles of the Columbia and Western road from Trail up the Columbia river has been awarded to a Butte, Montana, firm and work will be started immediately.

At Nelson the Hall mine is producing 120 to 150 tons per day. There are about 225 men working at the mine, but owing to development work the output is not as heavy as it otherwise would be.

In the Deer Park the crosscut shows 20 feet of good ore. A wagon road will be cut out at once from the mine to the Red Mountain Railroad.

The new smelter in connection with the War Eagle will be built at Northport and will have a capacity of 250 tons daily. The plant will be constructed so as to treat both silver-lead and gold copper ores. The freight rate on ore from Rossland to the smelter will be 75 cents per ton and the treatment rate $6.25, or a total of $7. This will enable $10 ore to be mined at a profit whenever it is found in large bodies. A very conservative estimate of the amount of ore averaging over $10 and less than $20 per ton now in sight in Rossland mines places the figures at considerably over 500,000 tons.

UTAH.

Salt Lake *Tribune*: Returns from samples of the Four Aces show that upon the 400-foot level the ore contains 60 per cent lead and 99.6 ounces silver, while in a parallel chute at a depth of 350 feet assays showed 63 per cent lead and 91 ounces silver. On the 400-foot level there is exposed nearly a foot of galena, that is widening out as developments progress.

The Florence Lode Mining Company has been incorporated with a capital of $150,000, to operate the Silver Bar mining claim in Juab county.

Mercur *Mercury*: West Dip continues to be the center of attraction and people are flocking there in large numbers.

The Sacramento Company is working fifty men and milling 100 tons daily.

The Mercur Gold Production Company, whose property lies north of the La Cigale, have encountered the vein, but the values are low.

The old Park mine which was purchased by Riter and Loose will be incorporated, and development commenced.

Work has been resumed at the Sunshine. Men are sinking the incline and running in the 700 and 800 foot levels. The incline will be run down 1000 feet in search of richer ore and it is possible that the mill will not be resumed until a better body of ore is found.

Tintic *Miner*: The Homestake shaft has attained a depth of 250 feet and is going down on ore that is improving. At a depth of 300 feet they will cut out a station and begin drifting to tap the ore body that was uncovered by the former owners of the property, who abandoned work, as was the rule at Silver City when the pyrites were encountered.

The South Swansea has made another rich ore strike on the 400 level. The ore is the highest grade ever taken out of the mine.

On the Sunbeam at 300 feet, the last thirty of which has been through a very promising iron pyrites, they cut into a 20-inch vein of copper pyrites which has carried good values in silver and gold, where encountered above.

An option has been given on the Humbug mine at $300,000.

Eureka *Democrat*: At the North Star a whim is being used, but when the 300-foot level is reached a hoisting plant capable of reaching the 1000 level will be put in. A mill is contemplated and arrangements are being made to begin its erection.

IDAHO.

Spokane *Chronicle*: The Tip Top Gold Mining Company has been organized to operate the Tip Top mine in the Florence district. The ledge is over 8 feet wide, carrying 40 ounces of silver and $20 in gold.

The recent strike in the Yellow Jacket mine surpasses all discoveries yet made. The ore body is 40 feet wide and runs $12 per ton.

MONTANA.

Col. Thos. Ewing, manager of the Diamond Hill Gold Mines, Ltd., reports that the dam for the electrical plant is more than half completed. The big ditch for carrying the water to the power plant is finished, and so is the bed of the flume of 6000 feet. At the mine, the working tunnel, 7x8 feet in the clear, has been driven more than 200 feet within thirty days. The site for the new 120-stamp mill is being graded. He expects the machinery to begin arriving from San Francisco about January 1st.

Butte *Miner*: The new engine at the Original mine has been started. The mine will be pumped dry in a few days, when the work of sinking the shaft 200 feet deeper will be commenced. It is expected that ore will be shipped from the Original by January 1st.

The Butte & Boston Co.'s property will be sold February 1st. As soon as the sale is confirmed by the court a Montana board of directors will be formed and the management decided upon. The money realized from the sale of the property will be used to pay off the unsecured debts against the company first.

Inter-Mountain: A conservative estimate of the mineral output of Butte for the year is as follows:

	Pounds Copper.
Anaconda	130,000,000
Boston & Montana	45,000,000
Montana Ore Purchasing Company	18,000,000
Parrot	14,000,000
Colorado	5,000,000
Clark's Reduction Works	4,000,000
	216,000,000

At an average price of 11 cents per pound, Butte's copper product alone will reach $23,760,000, with one of its principal producers (the Butte & Boston) shut down during the year. It is estimated that the gold and silver, bi-products of the copper ores, will yield $8,000,000, so that the total output of the district will reach $31,760,000.

The total value of the copper, silver and gold product of Butte since the year 1880 and conservatively estimating the output of the present year based on the returns for the last ten months is as follows:

1880	$ 1,000,000
1881	1,247,500
1882	2,100,000
1883	1,950,000
1884	6,720,000
1885	11,159,000
1886	13,246,500
1887	16,113,500
1888	19,500,000
1889	22,859,000
1890	23,000,000
1891	23,465,000
1892	26,500,000
1893	24,819,000
1894	27,189,000
1895	30,080,000
1896	31,760,000
Total	$289,338,500

Butte will this year produce 65 per cent of the total copper product of the United States.

SOUTH DAKOTA.

The annual report of State Mine Inspector Jeffrey for the year ending Dec. 1, 1896, has been filed. He says in part: "The unusual activity in mining seen during the year 1895 has been maintained throughout the year 1896. I have reported 1927 miners employed for 1896, which does not include men engaged at the mills, smelters and other reduction works, and such other vocations above ground as are directly connected with mining operations. This is in excess of the year 1895 by 224 men. The increase of the gold product for 1896 over that of 1895 is $1,268,675, and the outlook for the year to come is more promising than ever.

"The siliceous ore bodies have been largely developed. In fact, the work in this line is described as phenomenal, and made more certain and profitable by the fact that the old 'hit and miss' methods of prospecting and developing these bodies have given way to more intelligent and scientific search, aided by a far better understanding of the formation in which paying ore is to be found. The possibilities of the siliceous ores alone promise a future for the Black Hills, of which a conservative survey might easily be declared fabulous. The find in the Bald Mountain, Ruby Basin and Spearfish districts give promise of greatly increased gold output for the future. The ores of all these districts are easy of access, the districts being laced with a network of railroads, reaching to all mines of any importance, while no complicated machinery is required in their operation, the pick and shovel and hand drills being effective in prosecuting economical work.

"Reduction works of all classes are increasing their plants and getting in shape to handle a larger output of ore than in any past year.

"Transfers have been made of the

Lew Wallace, for	$ 18,000
Axiom group	20,000
Bottleson and Plutus	180,000
Florence	90,000
Galena property	400,000

"Bonds have been issued for

Sitting Bull and Richmond, unknown.	
Deadbroke (six months)	$85,000
Snowstorm (six months)	75,000
Montezuma	50,000

"The following table shows the amount of ore milled by smelters and reduction works, and the value of the output of each for 1896:

	Tons Milled.	Value.
Homestake	390,000	$1,552,000
Highland	182,000	737,000
Deadwood-Terra	204,000	400,000
Apex Con. Co.	8,000	24,000
J. R.	1,600	15,000
Keystone	18,600	85,000
Holy Terror	10,000	72,000
Deadbroke	7,500	50,000
St. Elmo	800	10,000
Grizzly Bear	1,350	12,000
Hawkeye	6,300	22,000
Columbus	1,000	5,000
D. and D. Smelter	75,000	1,150,000
Galena Smelter	4,300	55,000
Golden Reward (ten months)	37,887	611,134
B. H. G. and S. Ex. Co.	16,800	252,621
Kildonan	38,000	700,000
Ores ship'd from Black Hills	4,300	258 000
Placers, estimated	.....	18,000
Total for 1896	1,007,387	$6,178,675
Total for 1895	833,890	4,910,000
Increase	173,587	$1,268,576

"Added to this output of the D. and D. smelter there is an annual output of $200,000 in copper from ores shipped in for treatment.

"The increase of men over last year is largely in the free-milling districts of the southern hills and the Galena district. The demand for men from the free-milling district would indicate that greater attention is being attracted to these parts and that capital is looking that way. The prospect for that district grows brighter each year, as deeper sinking shows good prospects.

"Since the above report was compiled, discoveries of high-grade siliceous ores have been made in the limestone formation in and around Ragged Top mountain, which bid fair to rival both in value and amount any yet made in the Rocky mountain region."

COLORADO.

(Special Correspondence).—The most striking developments and the richest finds recently uncovered in the Victor district have been on Beacon hill. The most phenomenal of all is that of Blunt Bros., lessees on the Fannie B. According to the purchase of ore made by a local sampler, the first grade ran in gold 998 ounces to the ton; the second, 170 ounces.

The Vindicator, owned by the Vindicator Consolidated Gold Mining Company, on Bull hill, opened up in May, 1895, now makes a definite showing. The main working shaft is down 300 feet. There are four levels, the second being 120 feet from the surface, and runs 300 feet, showing a chute of ore the full length of the drift. The vein is about 4 feet wide and the ore, which is oxidized, runs about $22 per ton, with some higher grade in the pay streak. On the 200-foot level the ore chute is about 8 feet wide. At the latter depth a parallel vein was struck and has been opened for 175 feet, showing 12 feet in width, ore chute 75 feet in length, running in gold about $47 per ton. At the fourth level the same vein was cut 253 feet from the surface and is opened up for 120 feet and stoped to the third level, showing good values and increasing width of ore chute.

The Ashmont, on Raven hill, west of the Elkton, has a shaft down 125 feet and has struck ore on the 65-foot level. Shipments thus far have run $24 to $130 per ton.

The Legal Tender, now known as the Golden Circle, on Bull hill, output 1000 tons of ore for November, and the December product will be about the same. Shipments were from the various levels in the 300-foot shaft.

The Theresa, on the south slope of Bull hill, shipped 220 tons in twenty days in November from the drifts and stopes from the 200-foot shaft. For the first fifteen days in December the shipments were 200 tons of medium grade.

The Providence is located within the town of Victor. Its shaft is down 170 feet. At the 100-foot level is a drift 135 feet north and one 65 feet south. They are supposed to be on the same vein that has made the Gold Coin property of great value.

The Gold Coin was discovered while grading the streets of the town of Victor. The vein was followed under the Victor Hotel and on toward the saddle between Battle and Squaw mountains. A surface excavation 100 feet long uncovered ore all the way, and they are now understoping back to the point of beginning. A large ore house is being built and a steam hoist is in operation at each shaft.

The Coriolanus and Hallett & Hamburg, between Battle and Squaw mountains, show some progress. The former is leased to Coleman, Jamison & Co.

The Golconda, at the foot of Straub mountain, has a good plant of machinery and is sinking with the expectation of striking the May Bell vein, whose workings in the May Bell tunnel show positive values. The vein trends toward the well-known mines on Battle mountain.

The Anchoria-Leland, over on Gold hill, one of the best-known producers of the district, having the modest stock issue of 600,000 shares of the par value of $1 per share, constitutes a close corporation. Its workings consist of a three-compartment shaft, 700 feet deep, and about 1000 feet of drifts and levels. Two sets of compressed air drills are operated. One shipment of high-grade ore is made a month to the smelters, which runs about 250 ounces gold to the ton. The second grade ore is milled by cyanide and chlorination and yields about 1¼ ounces in gold to the ton. It is the intention to sink the shaft to a depth of 1500 feet.

WASCOTT.

Victor, Col., Dec. 19, '96.

ARIZONA.

F. Powers is erecting a 10-stamp mill to reduce the ores of his World's Fair mine, near Harshaw.

Finnegan, Jones and St. Charles of Kingman have taken a lease and bond on the Lucky Boy group of mines. Recent assays show a value of 1150 ounces silver, and $70 gold per ton.

The Connor and Minnesota mines are both showing up well in silver and gold ore. Fourteen men are now employed, but the 10-stamp mill is not operated all the time on account of an insufficient water supply.

The new hoist placed on the Treasurer mine at White Hills will be used in sinking the shaft to a depth of 1000 feet.

The 10-stamp mill of the Cedar Valley Mining Company in Mojave county is running day and night.

Iowa and Chicago parties have recently purchased a group of mines near Cherry Creek. A 5-stamp mill will be erected. There is a 3-foot vein of ore running from $20 to $150 a ton gold.

Globe *Silver Belt*: At the Old Dominion, owing to the breaking of one of the blower shafts at the smelter, only the 100-ton furnace is in blast.

The hoist is in place on the Black Copper, and the sinking of the shaft, to a depth of several hundred feet, will be resumed at once.

An English syndicate has become interested with N. L. Amster in the bond of the Continental group, west of Globe. The first work contemplated is to drive a cross-cut tunnel 500 feet, and continue the present shaft down 150 feet to connect.

NEW MEXICO.

Silver City *Enterprise*: At Pinos Altos the Treasure Mining Company has fifty men employed in the mine and mill. Twenty tons of ore is crushed per day, about 60 per cent of the gold being saved upon the plates and the balance is recovered in the concentrates of which about five tons are saved daily.

Manuel Taylor has nine men employed on the Providencia mine.

Herbert Dawson is working twenty men on the Santa Rita company's mines which he has leased.

The Elnora mill is about completed.

At Mogollon the Confidence mine is producing about fifty tons of ore per day and twenty stamps of the company's mill is kept at work.

LOWER CALIFORNIA.

Lacy brothers have purchased the Bareno Bros. mines at San Francisquito, on the gulf coast of Lower California. They intend to open up the mines on a large scale.

A schooner is to load at San Francisco with machinery and supplies for P. Allsopp, who has purchased an interest in the Salorio mines at San Francisquito. Allsopp is said to be preparing to invest a large sum in the mines.

Practical Information.

Pneumatic Power in Workshops.

In ordinary compact factories with fairly efficient steam plant, the gross cost of the motive power, that is, of fuel, oil and water, is but one per cent of the total paid out in workmen's wages.

In ironworking, pneumatic power often increases a man's output of work 200 per cent. Then, if supplying one man with his proportion of the motive power were by the use of air to increase his proportion of the motive power cost by 50 per cent, it is evident we should then have a similar 50 per cent margin for profit. As the actual cost is nearer 5 per cent there is evidently a wide margin for extra outlay in machines or in their repair, which expenditure, per day or per man, is increased in the attempt to use pneumatic power, but in the cost of such tools as drills, rhymers, taps, boring cutters, etc., is not increased per foot run of actual work done, when compared with manual labor.

Thus it is clear that if the additional machinery a factory makes or purchases in trying to use air as a distributor of power is confined to such tools as will be often or fairly continuously used, this outlay is justified, and the cost of compressing relatively to total wages is so small that tools evidently wasteful in the use of air are economical, or rather show a net balance to the good, if the men find them portable, easily adjustable and handy to use, and their simplicity of make and freedom from repairs and breakdowns, results in but few delays to the steady output of work.—J. D. Barnett.

An important feature in the mechanical world is predicted by a writer in *Engineering* for the material known as [illegible] iron, now being introduced. Its tensile strength is represented to be sixty-three thousand pounds and more to the square inch, and, after being heated to a dull red and plunged into cold water, it can be easily filed, showing that it takes no temper. Specimens are shown which have had portions heated and drawn out under the hammer after being twisted cold, without fracture, and a notable piece of work of the new metal is mentioned, viz., a heavy chain, of which the links were cast open, then joined and welded without the use of flux; also valve stems, crankshafts and other similar pieces, finished to pattern in a lathe and exhibiting surfaces without a blowhole, intricate castings, too, being reproduced regularly without failure, while a very high percentage of losses has attended other methods of producing very strong castings. The main question, however, is that of cost, for there are foundries that produce castings which will stand all the above tests, but without being really cheap, as is claimed for this new method.

Among the patents recently granted is an arrangement for giving automatic signals to a locomotive by means of a lever placed so as to be actuated as the engine passes over certain parts of the track. Arranged along the track is a third rail, which may be a continuous rail or a series of broken rails, these rails having beveled ends, and being so placed that, in passage of a locomotive, a wheel supported from a bracket will ride upon the third rail, the depression of the lever causing the whistle to be sounded, add the rotation of the wheel sliding a rod in a sleeve and swinging the other lever to ring the bell. The third rails are placed along the track near crossings, and at other places where it is desired to give warning, a continuous rail causing a continuous blast of the whistle, and a series of broken rails producing intermittent blasts.

A company of English glass workers are making the claim that ordinary plate glass will make a more durable monument than the hardest marble or granite known to stonemasons. Glass is practically indestructible. Wind, rain, heat and cold have their effect on the hardest rock; solid granite eventually crumbles away, and one can seldom read the inscription on a stone gravestone fifty years old. A glass stone will look as fresh a couple of centuries after its manufacture as on the day it was erected, and the inscription can be made ineffaceable. The thick plate glass used to glaze the portholes of steamers can resist the stormiest sea, and is practically unbreakable.

A new floor-making material called "papyrolith," has been invented by Otto Kraner, of Chemnitz, Germany. The article is a special preparation of paper pulp in the form of a dry powder. This, when mixed with water, may be spread like mortar over stone, cement or wood, where it dries quickly and may be smoothly planed; besides which, it may be tinted almost any color, so as to adapt it for parqueting with variegated borders, or for panels and mosaics. Among the advantages claimed by the inventor are freedom from crevices, non-conductivity of heat, elasticity, and remarkable durability.

An iron ship weighs 27 per cent. less than a wooden one, and will carry 115 tons of cargo for every 100 tons carried by a wooden ship of the same dimensions, and both loaded to the same draught of water.

Gold in Nevada.

On his return East from an examination of the mineral district of eastern California, east of the Sierras, and of western Nevada, by Director Walcott of the United States Geological Survey, the Boston *Transcript* had the following to say: "He made a careful study of the gold deposits of Silver Peak district of Nevada and also visited several points of interest along the Inyo range of eastern California.

"He considers the group of quartz mines on the ridge northwest of the town of Silver Peak, Nevada, as embracing one of the most promising gold districts of the West. The mines of this group extend along the line of outcrop for between three and four miles. They have never been opened up systematically, and very little work other than prospecting has been done upon them during the last thirty years, the rich silver mines situated some six miles to the south having monopolized the attention of those interested in mining development in the district. There is no need, however, of extensive mining operations to show the extent and value of the gold-bearing quartz; it lies on and near the surface along the eastern slope of the range, and is cut through by six main canyons. These canyons reveal the fact that a quartzite of Lower Cambrian age is penetrated on the line of its bedding by a large number of quartz veins, all of which are auriferous. Some of these are fully 6 feet in thickness, large portions of the mass averaging $10 to $12 per ton. Large pockets occur which are much richer. If this single group of mines were worked by modern methods they should together produce at least $1,000,000 a year, and possibly much more.

"There are other promising gold deposits which are located west of Sodaville, in Esmeralda county, Nevada, and there is still much gold left in Gold Mountain district, about fifty miles southeast of Silver Peak.

"Mr. Walcott's purpose in visiting this region was to determine whether it was desirable to enter upon the topographic mapping and geological survey thereof. He thinks that the work should be taken up at once and is of the opinion that, with better transportation facilities, there will be further discoveries of gold, and that mines already known, but now idle, will be worked. There is, moreover, a bituminous coal field twenty-five miles north of Silver Peak which promises to be of economic interest, as well as copper deposits west of Saline Valley. Under existing conditions the extensive silver deposits cannot be worked with profit."

Do You Know

MINING AND SCIENTIFIC PRESS.

Established May, 1860.

A paper that has led in its line for thirty-six years must have the qualifications that entitle it to the patronage of intelligent men who realize that, while advertising pays, money is thrown away that is given for advertising in papers with no circulation and which gives no results.

It is not what advertising costs, but what it produces, that determines its value.

The MINING AND SCIENTIFIC PRESS produces satisfactory results to those who use it. : : : : : :

Economy is the judicious expenditure of money. It is sometimes economy to save ten cents; it is sometimes economy to spend a thousand dollars. Economy in advertising means to put your advertisement where it will do you good.

Success or failure depends upon profitable advertising. Our patrons find an investment in our columns a profitable one.

✦✦✦ Practical Working Plans and Specifications Provided for All Machinery F rnished or Structures Built By Us. ✦✦✦

Coast Industrial Notes.

—It is proposed to start a new bank in Carson, Nevada.

—The Albany, Or., woolen mills will shortly resume operations.

—Nearly 40,000 head of cattle from the Harney country have been shipped from Ontario, Or., this season.

—About 3000 head of beef were fed at Reno, Nevada, this winter, sold for 6 cents on condition that sellers keep the cattle until Christmas.

—The Mariposa Electric Company, Mariposa, Cal., capital stock, $1,000,000, is credited with intention to erect a plant to cost $300,000 on the Merced river.

—Fire losses on the Pacific coast for the past three years show a gradual reduction. In 1894 the figures were $4,993,425; for '95 $4,143,161; '96 $3,655,810.

—The Terminal Railroad Company of Los Angeles have determined to substitute electricity for steam as a motive power between Los Angeles and Verdugo Park.

—At an auction sale of horses of the Northern Pacific Railway Company at Tacoma, Wash., last week 1100-pound matched teams sold for $4.50 a team and 1000-pound horses broken to ride or drive $2.50 a head.

—One firm of rasin packers in Hanford, Cal., has disbursed $50,000 in the past month for raisins. There are eight packing houses in Kings county and collectively these houses have disbursed nearly $500,000 within a month.

—About 100,000,000 feet of fir is now afloat in Puget sound. The Port Blakeley Mill Company has nearly one-quarter of the whole amount, the Puget Sound Mill Company about one-fifth and the Tacoma Mill Company nearly one-sixth.

—It is stated that the Pacific Coast Railroad running from San Luis Obispo, Cal., to Los Olivos is to be extended to Santa Ynez. J. S. Bace, vice-president of the company which controls the line, says that work will be begun at once and pushed to completion.

—It is proposed to build a boulevard from Tacoma, Wash., to University Place, on the Narrows; then around Gravelly and American lakes, and with sub-driveways through all the National Park region extending thirty miles toward Portland. Rights of way outside the city limits have been secured.

Recently Declared Mining Dividends.

Le Roi, British Columbia, $25,000, payable Dec. 4th. Total in thirteen months $250,000.

Bullion-Beck, Utah, $45,000, Dec 31; a total to that date of $1,947,000.

Hope Mining Co., Hope, Montana, $10,000; a total to date of $612,252.

Last Chance mine, $20,000 on Nov. 20.

Fortuna M. and M. Co., 10c per share, payable to-day.

Recent California Mining Incorporations.

Sunny South Mining and Development Company, Sonora: J. F. Summers, T. W. Wells, D. Cozzens, J. H. Shine, J. B. Curtin, Sonora, Cal.; capital stock, $300,000; subscribed, $25.

Anaconda Gold Mining Company, San Francisco: T. W. Ames, T. H. Ward, J. W. Ebert, C. W. Waitt, W. M. Ward, San Francisco; capital stock, $1,000,000; subscribed, $100.

Lakeview M. and M. Co., San Francisco: C. W. and A. C. Griffin, Alameda, R. R. MacLeod, T. E. Johnson, San Jose, L. E. Prusso, San Francisco; capital stock, $100,000; subscribed, $1000.

La Parisima G. M. Co., San Francisco: J. M. Linehan, E. Pohli, San Francisco, J. S. Butler, J. Hutchinson, Palo Alto, J. L. Given, Oakland; capital stock, $3,000,000; subscribed, $250.

Personal.

D. F. VERDENAL, who was for many years a well-known mining secretary in this city, and who is now making his home in New York, is in San Francisco on a visit.

THE following officers have been elected by the Alameda County Miners' Association: President, Professor S. B. Christy, of the mining department of the University of California; vice president, F. Chappellet; secretary, Thomas W. Jeffress; executive committee, E. H. Benjamin, Charles G. Yale, W. R. Thomas and J. S. White.

THE following have been named by the nominating committee of the California Academy of Sciences as candidates to be presented at the annual election, January 4th, 1897: Dr. David Starr Jordan, president; William E. Ritter, first vice-president; Dr. H. H. Behr, second vice-president; J. O'B. Gunn, corresponding secretary; G. P. Rixford, recording secretary; Charles R. Keeler, librarian; Charles F. Crocker, W. S. Keyes, E. J. Molera, George C. Perkins, W. S. Chapman, Granville W. Stewart, trustees.

Commercial Paragraphs.

SHOWERS & DOWNING have purchased from the Prospective Mining and Machinery Co., 127 First st., S. F., another Tremain Steam Stamp, to place by the side of the one bought last July, which is now crushing custom ore at Garlock, Cal.

THE new chlorination works of the Colorado-Philadelphia Reduction Company, at Colorado City, Colorado, is practically complete, and has been operating since Nov. 1st. The buildings, five in number, are very substantially built and the entire plant impresses the writer as one of the largest and one of the best equipped of its kind in the country. The first building contains the machinery and apartments for crushing and sampling, with an 80 horse-power engine which operates separately and apart from the other buildings. The second building contains the bedding floor and dryer, while in a separate compartment of the same structure are the five finishing rolls and the three Ropp furnaces. Under the third roof are ten chlorination barrels, the settling tanks and the precipitation room. Crude oil, piped from Florence, serves as fuel for the furnaces. A 268-horse power engine drives the machinery in the rollroom, dryer, furnaces, barrel room and elsewhere. As yet only Cripple Creek ores are being treated, and of those only the medium grade, which run from $20 to $40 per ton. The small per cent of sulphur contained in these ores practically disappears under the roasting process.

MINING EXPERT, - - - - - WILLIAM JOHNS.

320 SANSOME STREET, Room 11, San Francisco, Cal.

THIS COMPANY has been formed under the general laws of the State of California; to have its principal place of business at the City and County of San Francisco: to have a Capital Stock of Two Hundred and Fifty Thousand ($250,000) Dollars, divided into Fifty Thousand (50,000) Shares of the par value of Five ($5) Dollars each; its Board of Directors to consist of Five (5) persons, the gentlemen whose names are given herein being stated in the Articles of Incorporation as those appointed for the first year.

The purposes of the Company, as expressed in its Articles of Incorporation, are the following:

To act as agents for owners, sellers or purchasers of mining property upon the Pacific Coast in connection with the management, sale or purchase of such property; to make examination, inspection and exploration of mining property, and render reports thereon; to procure the examination of the title to mining property and to furnish a certificate thereof; to acquire by purchase or otherwise, hold, work, sell and convey and otherwise deal in mines, mining and other property either on its own behalf or as trustee or agent for others; to acquire and hold, buy, sell and dispose of shares of stock in other corporations; to act as agent or commission merchant in procuring and furnishing machinery, stores and general supplies required in the business of mining; to act as financial agent in connection with the purchase, sale, development or working of mining property, or the lending of money on security thereof; to do such other acts and conduct such other business as may be found to be to the interests of the corporation and in furtherance of the corporate purposes hereinbefore expressed.

It will be the policy of the Company to attain and preserve the highest possible reputation and standing as well for integrity of business character as for efficiency and reliability of the experts and other agents employed by it. The great importance and influence of such an institution will be manifest to all persons who have been connected with the mining industries of this Coast.

We, the undersigned, having read the foregoing Prospectus, approve the purposes therein set forth. We believe that a responsible and trustworthy company such as is proposed would supply a want long felt in this community.

J. H. NEFF, President California Miners' Association.
WM. JOHNS, Manager Sierra Buttes Gold Mining Co.

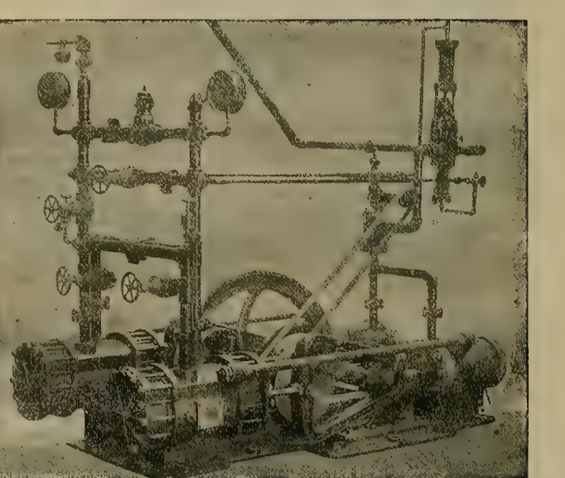
DOUBLE PIPE AIR COMPRESSOR.



This is a cut of the Double Pipe AirCompressor, the Compressor that is guaranteed to save 30% in power over any other make. It is cheapest to buy, cheapest to carry about and cheapest to run. If your fuel or water costs you anything, you want this Compressor. If you can get railroad freights free, and can carry machinery to your mine without cost, and your power costs you nothing, any make of Compressor will do you. You will be under no necessity to write to PNEUMATIC POWER CO., at 306 Pine St., San Francisco, Cal. We could save you money, though, in cost of foundations, as our Compressors are half the size of other makes.

PELATAN-CLERICI PROCESS.
Patented in U. S. and Other Countries. Capital, £100,000.
London Head Office.....8 Drapers Gardens.
Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.

This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.
Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.
F. CLERICI, Manager for U. S.

KENDALL GOLD AND SILVER EXTRACTION CO.
THE KENDALL PROCESS is the most efficient method of using cyanide for the extraction of precious metals from their ores. Wherever this process has been adopted the result has been increased percentages of values recovered and saving of time. Material reduction in consumption of chemicals has also been demonstrated with respect to several classes of ores.
All ores, without exception, amenable to cyanide treatment can be treated to better advantage by the Kendall Process. This can be accepted as an axiom.
The manager of one of the largest mines in the Mercur District, Utah, wires: "We now begin to understand dioxide process; last twenty days treated 220 tons per day of $26.50 ore, average of all tailings samples $0.83."
Owners of mines and reduction works can obtain full information on application to

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

RAILWAY RAIL JOINT.—C. J. Cochran, Sisson, Siskiyou, Co., Cal., assignor of one-half to Geo. H. Flett, of same place. No. 572,694. Dated Dec. 6, 1896. This invention relates to that class of railway rail joints in which fish plates are employed, and it consists in a novel means for fastening the plates to the web of the rail. The fish plates have enlarged portions or longitudinal slots with contracted extensions between them and the bolts are formed with shanks which turn in the holes of the rail webs and in the enlarged portions of the holes in the fish plates but cannot turn in the extentions. The heads of these bolts are adapted to pass horizontally through the holes in the rail webs and plates when they are in line, but when turned vertically to traverse said holes and extend beyond, the plates are moved sideways to throw the holes out of alignment and the bolts are locked. This prevents the plates from sliding out of place after they have once been locked, and secures the parts firmly together, at the same time making it easy to disengage them when required.

LADDER.—G. E. Chittenden, Niles, Cal. No. 572,693. Dated Dec. 8, 1896. This invention relates to the class of ladders. It consists essentially of uprights with steps extending between them and a top, this top being adapted to swing to and from the uprights, legs pivoted in said frame and adapted to swing sideways, said legs extending above their pivotal centers, a brace hinged at its forward end and slidably connected at its rear end with a guide frame and lines connecting this brace with the upper ends of the legs so that when the brace is moved down the legs are spread into position. The steps are secured to the uprights by metallic straps encircling the steps and uprights and secured to both. The latter is thus easily set up and adjusted upon any surface upon which it is necessary to use it.

THE OVERLAND LIMITED,
VIA
UNION PACIFIC.
Only 3 1-2 Days to Chicago-----3 1-2.
Only 4 1-2 Days to New York---4 1-2.

The Union Pacific is the only line running Pullman double Drawing-Room sleepers and Dining Cars San Francisco to Chicago daily without change. Only one change to New York; dining car service entire distance. Vestibuled composite buffet smoking and library cars between Ogden and Chicago.

The only line running upholstered Pullman Tourist sleepers San Francisco to Chicago daily without change, and personally conducted excursions to St. Paul and Chicago without change, leaving San Francisco every Friday.

Tickets and sleeping-car reservations at No. 1 Montgomery St. Steamship tickets on sale to and from all points in Europe. D. W. HITCHCOCK, General Agent, San Francisco.

RUPTURE, Hydrocele, Varicocele, Piles, Fissure, Fistula, Ulceration, etc., cured without operation or detention from business. NO PAY UNTIL CURED. Consultation Free. Call or send for pamphlet.

COLORADO'S GOLD FIELDS.
Millions Upon Millions of Dollars in Gold Have Been Added to the World's Wealth.
It is a well-known fact that the richest and most famous gold mines in the known world are those of Colorado, many of which are paying to fortunate investors millions of dollars annually in dividends Some shrewd persons who invested only a few dollars are now receiving hundreds and thousands in profits, and, judging from present indications, there are more desirable chances to invest just now than ever before. New mines are discovered daily and old ones strike richer veins of gold.
In order to meet the great demand for reliable information about mines and mining camps, one of Denver's oldest and best known publishers has just issued a handsomely illustrated book accurately describing every mining camp in the entire State of Colorado, giving scores of truthful photo-engravings of famous mines, mountains, cities, etc. Cripple Creek, the world's wonder, is fully described; also a correct map of the district. Narratives of how many poor people have become wealthy by judicious investments in gold mines, and sketches of former prospectors who are now fixed for life. Tells how to avoid unscrupulous brokers and sharpers. The volume has been carefully compiled by a disinterested author and every statement made is guaranteed to be true All terms and phrases of miners fully explained; tables showing the State's production of gold and silver for 35 years past. The publisher will send by return mail a copy of the above great book upon receipt of $1 (currency or stamps), which also includes a full-paid yearly subscription to his big 56-column weekly family paper, the *Illustrated Sentinel*, of Denver, Colorado (established 1890). Clubs of 8 and six books, $5. The paper contains each week all the latest mining news and illustrations of Rocky mountain scenery, also true stories of love and adventure.

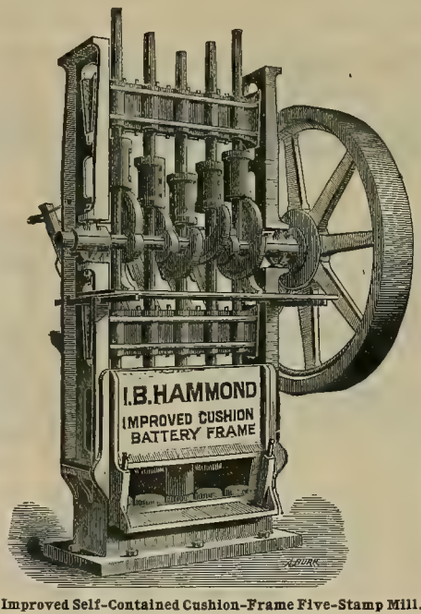
Roller Grinding Pans, Desulphurizing Furnaces, Etc.



Improved Self-Contained Cushion-Frame Five-Stamp Mill.
Patented in the United States and Foreign Countries.

The Improved, Iron-Frame, Self-Contained, Cushion-Frame, Five-Stamp Mill Saves Bills for Heavy Timbers, Millwright and Mechanics' Labor, and a Large Amount of Space. The term "Self-Contained" Means a Great Deal to the Mine Owner, and Can Be Readily Recognized and Appreciated in Making an Estimate For an Ordinary Five-Stamp Plant, When the Comparative Cost is Considered Over a Wood-Frame Mill.
FIRST: There is Saved by the Use of This Mill a Large Bill for Heavy Timbers, in Many Instances Obtained at Great Expense and Loss Of Time.
SECOND: The Saving in Mill-Wright and Mechanics' Labor in Framing and Erecting.
THIRD: The Large Amount of Space Saved.
Late improvements in the amalgamation and concentration of ores enable us to offer to the mining public, in connection with our Self-Contained Mills, an apparatus which amalgamates and concentrates at the same operation and provides a perfect trap for escaping quicksilver. Write to us for information.

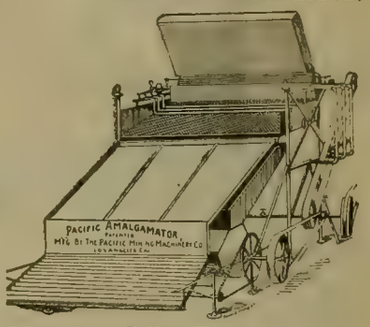
THE PACIFIC AMALGAMATOR



MILL OR PLACER.
A Guarantee With Each Machine.
This machine is the finest gold saver for both placer mines and quartz mills. No other plate necessary in mills where the Pacific Amalgamator is used. It is constructed almost entirely of metal; it can be transported on pack train. Possesses a large amount of silvered amalgamating plate surface. No scouring of amalgam. Any ordinary amalgamator can operate the machine with good success. Send for catalogue.

A Standard Work.
THIRD EDITION JUST OUT.
Assaying Gold
.....AND.....
Silver Ores.
By C. H. AARON.
This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.
The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores,") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy writers. The want of such a work has long been felt. It will be very desirable in the hands of many.
Table of Contents:—Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.
The volume embraces 126 12-mo pages, with illustrations, well bound in cloth; 1896. Price **$1.00** postpaid. Sold by the **Mining and Scientific Press,** 220 Market St., San Francisco.

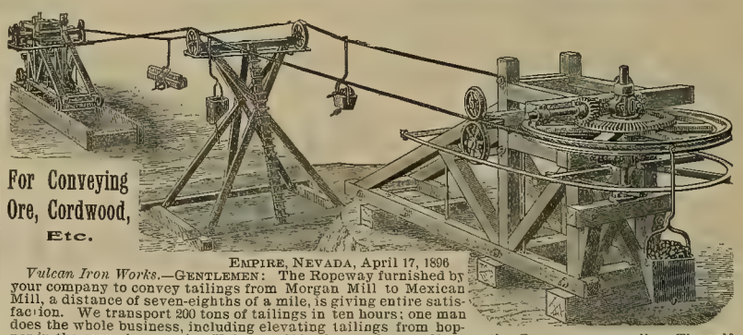
VULCAN ROPEWAY
—WITH—
AUTOMATIC ORE LOADER AND AUTOMATIC DUMPING DEVICE.



For Conveying Ore, Cordwood, Etc.

EMPIRE, NEVADA, April 17, 1896

Vulcan Iron Works.—GENTLEMEN: The Ropeway furnished by your company to convey tailings from Morgan Mill to Mexican Mill, a distance of seven-eighths of a mile, is giving entire satisfaction. We transport 200 tons of tailings in ten hours; one man does the whole business, including elevating tailings from hopper in the ground, operating Vulcan self-loader, and attending to the Roepway generally. The self dumper requires no attention whatever. The Vulcan loader I consider the best feature in the whole Ropeway, making it possible for one man to load 200 tons in ten hours.

Yours very truly, J. P. WOODBURY, Supt.

Market Reports.

The Markets.

SAN FRANCISCO, Dec. 24, 1896.

Throughout the year business was confined to actual requirements, which had its influence on all branches of trade, which, in turn, had a direct bearing on manufacturing and other industries. This conservatism was ushered in with the commencement of the year and became more pronounced as the months passed, particularly during the Presidential election campaign. While business was conducted on conservative lines, this very conservatism operated to restrict the number of failures. The gold mining industry has been one of the mainstays on this coast of general business. With a falling away of the interest felt in Europe in the African gold mines, idle capital there sought new fields for operation and naturally this coast was given preference. Experienced mining engineers in this country and abroad were brought into service for the purpose of investigating and reporting on mines offered for sale. The largest sale effected was the controlling interest in a copper mine at Butte, Montana, which ran into many million dollars, the exact amount never having been correctly given, either by sellers or buyers. This purchase attracted attention at all commercial centers and was the means of leading to inquiries for other copper mines, under the belief that the copper interests were being concentrated in the hands of a powerful European money combine that would bend its resources to keep the price of copper up.

The sales of gold mines this year are said to have been the largest on record; not only in numbers, but also in money consideration. Several sales were negotiated and carried out which ran from $1,000,000 up, while sales of from $100,000 up were largely in evidence. The buyers were Eastern and European persons. The latter were after the large propositions, those that had been developed, so as to have a good bullion output, with the promise of an increase with more thorough development work. The Americans have been content with the smaller propositions. It is quite impossible to get a correct list of the number of mines bought and the aggregate sum of money paid, and those in position to know say it largely exceeds the record of any former year. Large as it has been, the year 1897 promises to rival it, for the interest taken in our mines abroad seems to intensify, and with its growth more capital is offering for investment. Mining engineers of national reputation unequivocally assert that they expect to report on more mines in the next year than during any previous year. They say that the only thing which may prevent many negotiations going through will probably be the high view of sellers. For silver mines there has been no inquiry, as moneyed men do not seem to care for them unless they are large producers, owing to the low price of silver bullion.

During the past year silver bullion has ruled low, with the tendency downwards, although for the past month it has been steadier. The general legislation by all large countries against silver, has not lost its unfavorable influence. There has been a good demand from the arts and for shipment to India, and fair shipments to the Straits and Japan; yet China has taken very considerably below her yearly average. With improving business abroad, there has been more silver coin going into circulation, which may call for more to be coined in Europe. It is also stated that Russia's monetary reform includes the coining of silver as well as gold. The world's output of silver is steadily decreasing, particularly in the United States.

The consumption of copper during the past year has beat all former records. In Europe it has increased fully one-third, due to renewed activity in shipbuilding and the more general use of electricity. The large increased consumption caused the mines in this country to increase their output, and, although it is nearly 50 per cent more than last year, still the available supply of copper in America and abroad is comparatively small. The better-informed dealers in the metal at home and abroad say that the consumption will be larger next year than it was this, which will tax the mines to meet. The market price of the metal has not varied much. Dealings seem to have been confined to legitimate wants, and, in the absence of speculation, prices were fairly well maintained at nearly steady figures.

Quicksilver has been quiet throughout the year, with very few changes in market values. The consumption is not so large as it was a few years ago, owing to the depression in silver mining and the more general use of silver by mirror-glass manufacturers. The low prices of silver bullion and its superiority for backing purposes cause it to come into more general use. The output of the mines are under fair control at home and abroad. Mexico and Central America are our largest foreign consumers on this coast.

Lead has held to fairly low prices. The year opened with heavy supplies at home and abroad, but with a falling off in the output the consumption has caused a steady reduction in stocks, which is having a beneficial influence. Owing to the depression in trade in this country the consumption in the United States fell away, but improving trade abroad caused an increase in the European demand.

Pig tin sold at comparatively low prices throughout the year. The low prices for silver enabled imports to be made at lower figures from the Straits. The tinplate industry in this country has made rapid strides. Our manufactures have a yearly capacity of over 5,000,000 boxes, which has reduced foreign imports, owing to home consumers giving preference to American.

Pig iron held to lower prices until after the election, when slightly higher prices set in. This improvement has caused more furnace men to start up, and although the consumption promises to be large, yet the output, it is feared, will be excessive and cause continued low prices. There has been a steady growth in the export movements from Atlantic seaboard ports. This demand promises to be an important factor in the future. The mines on this coast have not increased their output. All turned out find a ready sale up north and in this city.

Coal held to low and unsatisfactory prices to coal miners, although towards the close of the year there is a strengthening in market prices in sympathy with higher freights from Europe and Australia. Coast mines did not increase their output which had the tendency to keep prices from going too low. The consumption of both steam and household has been quite free, and notwithstanding heavy imports at San Francisco stocks are not excessive for the season of the year. Coal from Cook's Inlet, Alaska, is beginning to seek our market. The deposits are said to be very extensive. The Elsinore coal meets a large part of the demand in southern California. The outlook for next year is favorable for better average prices.

Powder has ruled very low owing to strong competition between manufacturers. The low prices brought in heavy orders which have taxed the capacity of the manufacturers to meet. Towards the close of the year there are rumors of a combine. The advance in the market value of the shares seems to give color to the reliability of the reports, and if true higher prices will rule before long.

The export movements in lumber have been on a large scale. The aggregate shipments are said to be double that of last year's. Shipments from up north to the coast have also been heavy. Prices have not varied much, although a movement was inaugurated to advance them.

General trade has a holiday appearance. Importers, manufacturers and wholesale dealers are engaged in posting up their books, taking account of stocks and getting out a balance sheet at the close of the year, so as to learn on which side of the ledger their business was carried on this year. After the holidays business will begin to take on new life, and, from the present outlook, next year's business promises to be on prosperous lines. This opinion is grounded on good crop prospects and better average prices for farm products and continued activity in the gold mining industry. The opinion prevails that iron workers will do a larger business than was done this year in machinery and structural material.

The local money market is practically unchanged. Already quite a number of incorporated companies have declared dividends payable in next month. This will be followed by others during the week. The supply of available funds in the commercial and savings banks are larger than at this time last year, which gives assurance that after the turn of the year the rates of interest will shade off, unless there is an active demand for money of which at present, there are no signs. Bank suspensions at Chicago and St. Paul have no effect here for our institutions are conducted on much safer lines than those that suspended.

Eastern advices report easy money markets at financial centers on the Atlantic seaboard, with an excess of funds offering at New York. It seems that the suspension of four banks at Chicago and two at St. Paul has not had a serious effect. No failures in business circles have followed the suspension which indicates that solvent financial institutions there are caring for large depositors of the defunct banks. Some small sums are reported on some of the savings banks but without having any bad effect so far as advices report to this writing. That the worst is over seems to be evidenced in a decided upmove to-day in the Chicago market for wheat. This article of speculation is a good barometer as to the financial condition and general situation there.

New York Silver Prices.

NEW YORK, Dec. 24.—Following are the closing prices for the week:

	—Silver in—	
	London.	N. Y.
Friday	29⅞	65¼
Saturday	29⅞	65¼
Monday	29⅞	65¼
Tuesday	29⅞	65⅛
Wednesday	29⅞	65⅛
Thursday	29⅞	65⅛

	Copper.	Lead.	Iron.	Tin.
Friday	11 35	3 02½	11 00@13 00	12 95
Saturday	11 40	3 02½	11 00@13 00	12 95
Monday	11 40	3 02½	11 00@13 00	13 00
Tuesday	11 40	3 02½	11 00@13 00	13 00
Wednesday	11 40	3 02½	11 00@13 00	13 00

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	7@8
Commercial Loans, prime	6@8
Call Loans, gilt edged	6@7
Call Loans, mixed securities	7@8
Mortgages, prime, taxes paid by lender	6@8
New York Sight Draft	12½c Prem
New York Telegraphic Transfer	15c Prem
London Bankers' 60 days	$4.84½
London Merchants	$4.84
London Sight Bankers	$4.88
Refined Silver, per oz., 1000 fine	65⅛
Mexican Dollars	51¾@52½

SILVER.—The market has held to fairly steady figures throughout the week, although at the close it is a shade lower. The last steamer for the Orient took out $7000 in bullion for Hongkong and $117,000 for Japan. The East reports a continued fair export movement. From London our advices state that the holiday season interferes with the movement, although India is still taking quite freely. Mail advices from London give the exports of silver to India, and the Straits from Jan. 1 to Dec. 3, as follows:

	1896.	1895.	Changes.
To India	£4,372,778	£3,435,016	Inc. £937,682
To China	725,985	1,630,023	Dec. 904,038
To the Straits	700,396	731,783	Dec. 31,387
Total	£5,799,159	£5,796 902	Inc. £2.257

MEXICAN DOLLARS.—The market holds steady. Receipts show an increase. The last steamer for the Orient took out 211,078 dollars for Hongkong and 175,000 for Japan.

QUICKSILVER.—The market is quiet. The last steamer for Mexico and Central American ports took out 121 flasks.

The market is quoted as follows:

Domestic trade, per flask	36 50

For export, quotations are nominal but less than for home.

COPPER.—The market is quiet but steady, with apparently a firmer undertone. The East reports slightly better prices, with a good demand for the season of the year.

Ingot, jobbing	14⅛@—
Ingot, wholesale	13⅛@—
Sheet copper	17 @—
Bolt	¼ & 5-16, 20c; ⅜ and larger, 17c
Lake Superior Sheathing	20

LEAD.—The tone seems to be firmer, although there is an absence of a demand. Eastern and European markets are reported stronger.

Pig	— @ 3 75
Bar	— @ 4 00
Sheet	— @ 5 25
Pipe	— @ 4 50

SHOT.—There is a good seasonable deanmd. Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 20
Drop, B and larger sizes, " "	1 45
Buck, Balls and Chilled, do, " "	1 45

ANTIMONY.—Our market is quoted at 7½@8c in a jobbing way. New York mail advices quote 7¼c for Cookson's, 6½@6¾c for Hallett's and 6¼c for Japanese.

BORAX.—The market is quiet but firm at quotations. The last steamer for Panama took out 171,700 lbs en route for New York.

The market is quoted as follows:

Refined, in car lots	5
Refined, in sacks	4¾
Powdered, in car lots	4½
Concentrated, "	5

TIN.—There is nothing new to report either in our market or at the East.

Pig, per lb	14¼c@—
Plate, I C coke, heavy, per box	— @$4 05
" " " light, "	— @ 3 95

IRON.—The market is quiet, with no demand reported and none looked for until after the holidays. Imports of American and English were fairly large the past week. Rogers, Brown & Co. of Cincinnati write: "The feeling obtains generally that the coming year is to be one of great prosperity, and during the quiet period prevailing preparations are being made for the expanded business expected. Prices current are somewhat irregular, owing to the presence on the market of some warehouse lots and the eagerness of a few furnaces to realize on certain grades that have accumulated."

COAL.—Notwithstanding the heavy arrivals the market has not gone off, but on the contrary, is firmer for some kinds. About all that has come to hand was placed prior to arrival. The demand from yards is said to be good.

COKE.—The market is quoted as follows:

Gas Companies'	— —
English, to load	9 00 @ — —
" spot, in bulk	9 00 @ 10 00
" in sacks	11 00 @ 12 00
Cumberland	— — @ — —

POWDER.—It begins to look as if a combination is being formed to promote better prices the coming year.

The market is quoted as follows:

Hercules, No. 1*, per pound	11½c
" No. 2, " "	8½c

Mining Share Market.

SAN FRANCISCO, Dec. 24, 1896.

Mining shares the past week showed more strength at slightly higher prices. There were no fluctuations, and consequently outside operators have not been attracted to them. It is said that some of the buying was by persons who had sold short at high figures, and wished to fill so as not to have them out during the holidays. The selling was, to a considerable extent, by holders not wishing to carry them over the holidays in the face of more assessments to be levied in next month. So far as the news from the mines, either on the Brunswick lode or Comstock lode, is not of a character to inspire confidence with the outside dealers, but the work that is being done in two or three cause better informed operators to look for good results within the next month or two. The activity in the Hale & Norcross shares, noted last week, seems to have subsided, and dealing in Chollar to be coming to the front. The advance last week in Hale & Norcross, and the strength since shown, is owing to the resumption of work on the 900-foot level, and a strong probability of it striking the continuation of the ore found on the same level in Savage. Those in position to know think that if the ore is struck, quite a revival of activity in shares will follow. The strength in Chollar is said to be due to favorable news from the work on the Brunswick lode. The Bodie shares were stronger, with Bodie the leader. What the strength is based on it is hard to say, for those in position to know profess ignorance.

The news from the Brunswick lode is uninteresting. Official letters are valuable only from a statistical point of view, but operators take more interest in ore strikes than in the number of feet run each week from points that would often puzzle the proverbial Philadelphia lawyer to make clear to their minds. No ore is reported to have been run into in any of the mines working on that lode, but as the work is in unprospected or unknown ground the hope is entertained that any day a body of ore may be struck. It is this chance which makes the shares a gamble and causes outsiders to pay assessments. In Occidental they are working on the 550-foot and 750-foot levels, but with no encouraging formation reported. In Chollar they have men at work on its ore streaks on the 300-foot and 400-foot levels. During the week 49 tons of ore were extracted and sent to the Nevada mill. What it assayed in gold and silver official letters are silent. On the 400-foot level work is continued in the two crossdrifts while driving ahead the south drift. Stringers of quartz are cut by the crossdrifts, while the south drift was, at last advices, in a vein of porphy-

Take All the Advice : : : : : :

On advertising you can get; but don't act on it unless it appeals to your own judgment.—Printers' Ink, N. Y., Dec. 2, 1896.

ry, which has a promising appearance. Shaft No. 1 is down nearly 800 feet on an incline. Drifting has not been commenced on the 500-foot level. Active work is being done by both Best & Belcher and Gould & Curry on the levels heretofore reported in this department. In Savage work is continued in the 400-foot level, but no encouraging news is reported and none looked for.

From the Comstock lode our advices are practically unchanged since our last week's issue; yet this, it is said, can be changed for the better any day the powers that be desire. A large portion of the work seems to be of a kill-time character—that it is killing the patience of stockholders does not admit of a doubt, and unless ore strikes are made it will be hard to collect assessments. The official letter from Alta reports that work has been suspended on the Keystone ledge. In the east drift, on the 725-foot level, they continue to cut stringers of quartz assaying well in gold, which inspires the belief it may lead to quite a body of ore. In Overman work is still on the 900-foot level. A few tons of ore are raised each week. From milling of 61 tons of ore over $1200 gross was returned in bullion. Seg. Belcher raises a few tons of ore, but hardly enough to pay expenses, notwithstanding it is said to be mostly gold. The number of tons of ore raised by Belcher has run down to almost 30 tons a week. There is a continued silence where work is being done. This is contrary to law, as lately decided by the Supreme Court, which some of the directors may find out to their cost. In Crown Point work is being done on the levels heretofore reported. From Yellow Jacket nothing comes to hand. Confidence raises a few tons of ore each week. The long joint west cross-drift that is being run by Confidence, Challenge, and Con. Imperial is being driven slowly ahead. It is out nearly 900 feet. Work in Alpha is continued on the 550-foot level, with nothing of importance reported. In Bullion they are still drifting towards Potosi. No work is being done in either Chollar or Potosi. Some think that work has been stopped so as to resume it in a less favorable formation, on another level. Work in Hale & Norcross is on the 900-foot level. It is reported that they will run for the continuation of the ore found last spring in Savage. From Savage, Gould & Curry and Best & Belcher our advices do not report any change in the work. At the annual meeting of the shareholders of Gould & Curry it was voted to lease the upper levels of the old mine on the Comstock to J. H. Kinkaid for a term of five years. In Con. Virginia active work is still the order on the 1000-foot to the west, and 1650-foot level to the east, while on the 1750-foot level they are at work on several floors. The news, as a whole, is flat, stale and unprofitable to outside operators. In Ophir they continue work on the 1000-foot and central tunnel levels, with nothing new reported. In Mexican, Union, Sierra Nevada, Utah and Andes the official letters report work on the levels they have been working on for some time past. Nothing outside of porphyry was reported found the past week.

The following illustrates the changes of the week:

MINES.	Dec. 17.	Dec. 23.
Alpha		
Alta Consolidated	$ 04	$ 03
Andes	14	14
Belcher	32	45
Best & Belcher	58	47

Ophir	1 00	92
Overman	05	
Potosi	62	
Savage	35	31
Sierra Nevada	46	43
Union	41	38
Utah	05	
Yellow Jacket		34

Under date of December 18th F. H. Pettingell writes from Colorado Springs, Colorado: "Prices all along the line must advance, whether Eastern capital steps in or not. If we were more indifferent to the fault-finding and ever-suspicious Easterner, who, aside from their capital, represent little but ingratitude and a capacity for magnifying errors in the judgment of their broker, we would have less to regret. Not a few times in our experience have we seen one of this class make thousands of dollars by the judicious advice of his broker, and then by some little mistake on the part of the latter lose a few hundred, raise a hue and cry, and almost sacrifice his broker's reputation by bitter criticism, both in public and private. * * * Whether the great advance that is universally predicted follows the incoming of the new year or not, few losses will be sustained by investing with care in almost anything."

San Francisco Stock Board Sales.

SAN FRANCISCO, December 23, 1896.
